BENTLEY, RICHARD (1662–1742), English scholar and critic, was born at Oulton near Wakefield, Yorkshire, on the 27th of January 1662. His grandfather had suffered in person and estate in the royalist cause, and the family were in consequence in reduced circumstances. Bentley's mother, the daughter of a stonemason in Oulton, was a woman of excellent understanding and some education, as she was able to give her son his first lessons in Latin. From the grammar school of Wakefield Richard Bentley passed to St John's College, Cambridge, being admitted scholar in 1676. He afterwards obtained a scholarship and took the degree of B.A. in 1680 (M.A. 1683). He was in 1681 succeeded to a fellowship, being appointed by his college, before he was twenty-one, headmaster of Spalding grammar school. In this post he did not remain long, being selected by Dr Edward Stillingfleet, dean of St Paul's, to be domestic tutor to his son. This appointment introduced Bentley at once to the society of the most eminent men of the day, threw open to him the best private library in England, and brought him into familiar intercourse with Dean Stillingfleet, a man of sound understanding, who had not shrank from exploring some of the more solid and abstruse parts of ancient learning. The six years which he passed in Stillingfleet's family were employed, with the restless energy characteristic of the man, in exhausting the remains of the Greek and Latin writers, and laying up those stores of knowledge upon which he afterwards drew as circumstances required.

In 1689 Stillingfleet became bishop of Worcester, and Bentley's pupil went to reside at Oxford in Wadham College, accompanied by his tutor. Bentley's introductions and his own merits placed him at once on a footing of intimacy with the most distinguished scholars in the university, Dr John Mill, Humphrey Prideaux, Edward Bernard. Here he revelled in the MS. treasures of the Bodleian, Corpus and other college libraries. He projected and occupied himself with collections for vast literary schemes. Among these are specially mentioned a corpus of the fragments of the Greek poets and an edition of the Greek lexicographers. But his first publication was in connexion with a writer of much inferior note. The Oxford (Sheltonian) press was about to bring out an edition (the edidio princeps) from the unique MS. in the Bodleian of the Greek Chronicle (a universal history down to A.D. 560) of John of Antioch (date uncertain, between 600 and 1000), called John Malalas or "John the Rhetor"; and the editor, Dr John Mill, principal of St Edmund Hall, had requested Bentley to look through the sheets and make any remarks on the text. This originated Bentley's Epistola ad Millium, which occupies less than one hundred pages at the end of the Oxford Malalas (1601). This short tractate at once placed Bentley at the head of all living English scholars.

The ease with which, by a stroke of the pen, he restores passages which had been lost in hopeless corruption by the editors of the Chronicle, the certainty with which he accords and condemns the readings over the relevant material, are in a style totally different from the careful and laborious learning of Holy, Mill or E. Chilmead. To the small circle of classical students (lacking the great critical dictionaries of modern times) it was at once apparent that there had arisen in England a critic whose attainments were not to be measured by the ordinary academical standard, but whom these few pages had sufficed to place by the side of the great Grecians of a former age. Unfortunately this mastery over critical science was accompanied by a tone of self-assertion and presumptuous confidence which not only checked admiration, but was calculated to rouse enmity. Dr Monk, indeed, Bentley's biographer, charged him (in his first edition, 1830) with an indecorum of which he was not guilty. "In one place," writes Dr Monk, "he accosts Dr Mill as a 'learnshaw (Johnny), an indecorum which neither the familiarity of friendship, nor the likeness of a dead language, can justify towards the dignified head of a house.'" But the object of Bentley's apostrophe was not his correspondent Dr Mill, but his author John Malalas, whom in another place he playfully appeals to as "Syriscus." From this publication, however, dates the origin of those mixed feelings of admiration and repugnance which Bentley throughout his career continued to excite among his contemporaries.

In 1690 Bentley had taken deacon's orders in the Church. In 1692 he was nominated first Boyle lecturer, a nomination which was repeated in 1694. He was offered the appointment a third time in 1695 but declined it, being by that time involved in too many other undertakings. In the first series of lectures ("A Coaification of Atheism") he endeavours to present the Newtonian physics in a popular form, and to frame them (especially in opposition to Hobbes) into a proof of the existence of an intelligent Creator. He had some correspondence with Newton, then living in Trinity College, on the subject. The second series, published in 1694, was published and is believed to have been lost. Andrew Kippis, the editor of the Biographia Britannica, mentions MS. copies of them as in existence. Scarcely was Bentley in priest's orders before he was preferred to a prebendal stall in Worcester cathedral. In 1693 the keepership of the royal library becoming vacant, great efforts were made by his friends to obtain the place for Bentley, but through court interest the post was given to Mr Thynne. An arrangement, however, was made, by which the new librarian resigned in favour of Bentley, on condition that he received an annuity of £530 for life out of the salary, which only amounted to £200. To these preterments were added in 1695 a royal chaplaincy and the living of Hartlebury. In the same year Bentley was elected a fellow of the Royal Society, and in 1696 proceeded to the degree of D.D. The recognition of continental scholars came in the shape of a dedication, by Graevius, prefixed to a dissertation of Albert Rubens, De Vita Flavii Malii Theodori, published at Utrecht in 1694.
While these distinctions were being accumulated upon Bentley, his energy was making itself felt in many and various directions. He had official apartments in St. James's Palace, and his first care was the royal library. He made great efforts to retrieve this collection from the dilapidated condition into which it had been allowed to fall. He employed the mediation of the earl of Marlborough to beg the grant of some additional rooms in the palace for the books. The rooms were granted, but Marlborough characteristically kept them for himself. Bentley enforced the law against the publishers, and thus added to the library nearly 1000 volumes which they had neglected to deliver. He was commissioned by the university of Cambridge to obtain Greek and Latin founts for their classical books, and accordingly he had cast in Holland those beautiful types which appear in the Cambridge books of that date. He assisted Evelyn in his Numismata. All Bentley's literary appearances at this time were of this accidental character. We do not find him settling down to the steady execution of any of the great projects with which he had started. He designed, indeed, in 1664 an edition of Philostratus, but steadily abandoned it. G. Olearius, (Osioläger), "to the joy," says F. A. Wolf, of Oxford, "to the joy of all German professors, and to me personally also," with collations of Cicero and Joshua Barnes with a warning so as to the spuriousness of the Epistles of Euripides, which was sworn away upon that blunderer, who printed the epistles and declared that no one could doubt their genuineness but a man perficte frontis aut judicis immittunt. Bentley supplied to Graevius's Callimachus a masterly collection of the fragments with notes, published at Utrecht in 1667. The Dissertation on the Epistles of Phalaris, the work on which Bentley's fame in great part rests, originated in the same casual way. William Wotton, being about to bring out in 1667 a second edition of his book on Ancient and Modern Learning, claimed of Bentley the fulfillment of an old promise to write a paper exposing the spuriousness of the Epistles of Phalaris. This paper was resented as an insult by the Christ Church editor of Phalaris, Charles Boyle, afterwards earl of Orrery, who, in getting the MS. in the royal library collated for his edition (1665) had had a little quarrel with Bentley. Assisted by his college friends, particularly Atterbury, Boyle wrote a reply, "a tissue," says Dr. Alexander Dyce (in his edition of Bentley's Works, 1839-1838), "of superficial learning, ingenious sophistry, dexterous malice and happy raillery." The reply was hailed by the public as crushing and went immediately into a second edition. It was incumbent on Bentley to rejoin. This he did (1669) in what Porson styles "that immortal dissertation," to which no answer was or could be given, although the truth of its conclusions was not immediately recognized. (See Phalaris.)

In the year 1700 Bentley received that main preface which, says De Quincey, "was at once his reward and his scourge for the rest of his life." The six commissioners of ecclesiastical patronage unanimously recommended Bentley to the crown for the mastership of Trinity College, Cambridge. This college, the most splendid foundation in the university of Cambridge, and in the scientific and literary reputation of its fellows the most eminent society in either university, had in 1700 greatly fallen from its high estate. It was not that it was more degraded than the other colleges, but that, having acquired a character of its own, it was more conspicuous. The eclipse had taken place during the reaction which followed 1660, and was owing to causes which were not peculiar to Trinity, but which influenced the nation at large. The names of John Pearson and Isaac Barrow, and, greater than either, that of Newton, adorn the college annals of this period. But these were quite exceptional men. They had not inspired the rank and file of fellows of Trinity with any of their own love for learning or science. Indolent and easy-going clerics, without duties, without a pursuit or any consciousness of the obligation of endowments, they haunted the college for the pleasant life and the good things they found there, creating sincere offices in each other's favours, jobbing the scholarships and making the audits mutually pleasant. Any excuse served for a banquet at the cost of the "house," and the celerity imposed by the statutes was made as tolerable as the decorum of a respectable position permitted. To such a society Bentley came, obnoxious as a St. John's man and an intruder, unwelcome as a man of learning whose interests lay outside the walls of the college. Bentley replied to their concealed dislike with open contempt, and proceeded to ride roughshod over their little arrangements. He inaugurated many beneficial reforms in college usages and discipline, executed extensive improvements in the buildings, and generally used his eminent station for the promotion of the interests of learning both in the college and in the university. But this energy was accompanied by a domineering temper, an overweening contempt for the feelings and even for the rights of others, and an unscrupulous use of means when a good end could be obtained. Bentley, at the summit of classical learning, disdained to associate with men whom he regarded as illiterate priests. He treated them with contempt, while he was diverting their income to public purposes. The continued drain upon their purses—on one occasion the whole dividend of the year was absorbed by the rebuilding of the chapel—was the grievance which at last roused the fellows to make a resolute stand. After ten years of stubborn but inefficacious resistance within the college, they had recourse in 1710 to the last remedy—an appeal to the crown. This was an ill-drawn invective, full of general complaints and not alleging any special delinquency. Bentley's reply (The Present State of Trinity College, &c., 1710) is in his most crushing style. The fellows amended their petition and put in a fresh charge, in which they articulated fifty-four separate breaches of the statutes as having been committed by the master. Bentley, called upon to answer, demurred to the bishop of Ely's jurisdiction, alleging that the crown was visitor. He backed his application by a dedication of his Horace to the lord treasurer (Harley). The crown lawyers decided the point against him; the case was heard (1714) and a sentence of ejection from the mastership ordered to be drawn up, but before it was executed the bishop of Ely died and the process lapsed. The feud, however, still went on in various forms. In 1718 Bentley was deprived by the university of his degrees, as a punishment for failing to appear in the vice-chancellor's court in a civil suit; and it was not till 1724 that the law compelled the university to restore them. In 1733 he was again brought to trial before the bishop of Ely (Dr. Greene) by the fellows of Trinity and was sentenced to deprivation, but the college statutes required the sentence to be exercised by the vice-master (Dr. Walker), who was Bentley's friend and refused to act. In vain were attempts made to compel the execution of the sentence, and though the feud was kept up till 1738 or 1740 (about thirty years in all) Bentley remained undisturbed.

During the period of his mastership, with the exception of the first two years, Bentley pursued his studies uninterruptedly, although the results in the shape of published works seem incommensurable. In 1700 he contributed a critical appendix to John Davies's edition of Cicero's Tusculan Disputations. In the following year he published his emendations on the Plutus and Nubes of Aristophanes, and on the fragments of Menander and Pl linen. The last came out under the name of "Phil eleutherus Lipsiensis," which he made use of two years later in his Remarks on a late Discourse of Freethinking, a reply to Anthony Collins the deist. For this he received the thanks of the university, which acknowledged the services rendered to the church and clergy. His Horace, long contemplated and in the end written in very great haste and brought out to propitiate public opinion at a critical period of the Trinity quarrel, appeared in 1711. In the preface he declared his intention of confining his attention to criticism and correction of the text, and ignoring exegesis. Some of his 700 or 800 emendations have been accepted, but the majority of them are now rejected as unnecessary and prosaic, although the learning and ingenuity shown in their support are remarkable. In 1716, in a letter to Dr. Wake, archbishop of Canterbury, he announced his design of preparing a critical edition of the New Testament. During the next four years, assisted by J. J. Weisstein, an eminent biblical critic, who claimed to have been the first to suggest the idea to Bentley, he collected materials for the work, and in 1720 published
Proposals for a New Edition of the Greek Testament, with specimens of the manner in which he intended to carry it out. He proposed, by comparing the text of the Vulgate with that of the oldest Greek MSS., to restore the Greek text as received by the church at the time of the council of Nice. A large number of subscribers to the work was obtained, but it was never completed. His Terence (1726) is more important than his Horace, and it is upon this, next to the Phalaris, that his reputation mainly rests. Its chief value consists in the novel treatment of the metrical questions and their bearing on the emendation of the text. To the same year belong the Fables of Phaedrus and the Sententiae of Publius Syrus. The Paradise Lost (1732), undertaken at the suggestion of Queen Caroline, is generally regarded as the most unsatisfactory of all his writings. It is marred by the same rashness in emendation and lack of poetical feeling as his Horace; but there is less excuse for him in this case, since the English text could not offer the same field for conjecture. He put forward the idea that Milton employed both an amanuensis and an editor, who were to be held responsible for the clerical errors, alterations and interpolations which Bentley professed to detect. It is certain whether this was true or not; yet on the part of Bentley to excuse his own numerous corrections, or whether he really believed in the existence of this editor. Of the contemplated edition of Homer nothing was published; all that remains of it consists of some manuscript and marginal notes in the possession of Trinity College. Their chief importance lies in the attempt to restore the metre by the insertion of the lost digamma. Among his minor works may be mentioned: the Astronomica of Manilius (1739), for which he had been collecting materials since 1691; a letter on the Sigean inscription on a marble slab found in the Troad, now in the British Museum; notes on the Theriac of Nicander and on Lucan, published after his death by Cumberland; emendations of Plautus (in his copies of the editions by Paresus, Camerarius and Gronovius, edited by Schroder, 1868, and Sonnenschein, 1883). Bentleye Critica Sacra (1862), edited by A. E. Ellis, contains the epistle to the Galatians (and excerpts, printed from an interleaved folio copy of the Greek and Latin Vulgate in Trinity College. A collection of his Opuscula Philologica was published at Leipzig in 1781. The edition of his works by Dyce (1836-1838) is incomplete.

He had married in 1701 Joanna, daughter of Sir John Bernard of Brampton in Huntingdonshire. Their union lasted forty years. Mrs Bentley died in 1749, leaving a son, Richard, and two daughters, one of whom married in 1728 Mr Denison Cumberland, grandson of Richard Cumberland, bishop of Peterborough. Their son was Richard Cumberland, the dramatist. Surrounded by his grandchildren, Dr Bentley experienced the joint pressure of age and infirmity as lightly as is consistent with the lot of humanity. He continued to amuse himself with reading; and though nearly confined to his arm-chair, was able to enjoy the society of his friends and several rising scholars, J. Markland, John Taylor, his nephews Richard and Thomas Bentley, with whom he discussed classical subjects. He was accustomed to say that he should live to be eighty, adding that a life of that duration was long enough to reach everything with regard to his own time. "No man is master of all he proselytizes, but he is still a work in progress, does not possess his powers.

On the 14th of July 1742. Though accused by his enemies of being grasping, he left not more than £5000 behind him. A few Greek MSS., brought from Mount Athos, he left to the college library; his books and papers to his nephew, Richard Bentley. Richard, who was a fellow of Trinity, at his death in 1786 left the papers to the college library. The books, containing in many cases valuable manuscript notes, were purchased by the British Museum.

Of his personal habits some anecdotes are related by his grandson, Richard Cumberland, in vol. i. of his Memoirs (1807). The hat of formidable dimensions, which he always wore during reading to shade his eyes, and his preference of port to claret (which he said "would be port if it could worried by the Pope's caricature (Dunciad, b. 4), which bears in other respects little resemblance to the original. He did not take up the habit of smoking till he was seventy. He held the archdeaconry of Ely with two livings, but never obtained higher preference in the church. He was offered the (then poor) bishopric of Bristol but refused it, and being asked what pretenent he would consider worth his acceptance, replied, "That which would leave him no reason to wish for a removal."

Bentley was the first, perhaps the only, Englishman who can be ranked with the great heroes of classical learning, although perhaps not a great classical scholar. Before him there were only John Selden, and, in a more restricted field, Thomas Gataker and Pearson. But Selden, a man of stupendous learning, wanted the freshness of original genius and confident mastery over the whole region of his knowledge. Bentley inaugurated a new era of the art of criticism. He opened a new path. With him criticism attained its majority. Where scholars had hitherto offered suggestions and conjectures, Bentley, with unlimited control over the whole material of learning, gave decisions (Mäehly). The modern German school of philology does undrugging homage to his genius. Bentley, says Bunsen, "was the founder of historical philology." And Jakob Bernays says of his corrections of the Tristia, "corruptions which had hitherto defied every attempt even of the mightiest, were removed by a touch of the fingers of this British Samson."

The English school of Hellenists, by which the 18th century was distinguished, and which contains the names of R. Dawes, J. Markland, J. Taylor, J. Toup, T. Tyrwhitt, Richard Porson, P. P. Dобere, Thomas Kidd and J. H. Monk, was the creation of Bentley. And even the Dutch school of the same period, though the outcome of a native tradition, was in no small degree stimulated and directed by the example of Bentley, whose letters to the young Hemsterhuis on his edition of Julius Pollux produced so powerful an effect on him, that he became one of Bentley's most devoted admirers.

Bentley was a source of inspiration to a following generation of scholars. Himself, he sprang from the earth without forerunners, without antecedents. Self-taught, he created his own science. It was his misfortune that there was no contemporary gild of learning in England by which his power could be measured, and his eccentricities checked. In the Phalaris controversy his academical adversaries had not sufficient knowledge to know how absolute their defeat was. Garth's couplet—

"So diamonds take a lustre from their foil,
And to a Bentley 'tis we owe a Boyle"—

expressed the belief of the wits or literary world of the time. The attacks upon him by Pope, John Arbuthnot and others are evidence of their inability to appreciate his work. To them, textual criticism seemed mere pedantry and useless labour. It was not only that he had to live with inferiors, and to waste his energy in a struggle forced upon him by the necessities of his official position, but the wholesome stimulus of competition and the encouragement of a sympathetic circle were wanting. In a university where the instruction of youth or the religious controversy of the day were the only known occupations, Bentley was an isolated phenomenon, and we can hardly wonder that he should have flagged in his literary exertions after his appointment to the mastership of Trinity. All his vast acquisitions and all his original views seem to have been obtained before 1700. After this period he acquired little and made only spasmodic efforts—the Horace, the Terence and the Milton. The prolonged mental concentration and mature meditation, which alone can produce a great work, were wanting to him.

F. A. Wolf, Literarische Analekten, i. (1816); Monk, Life of Bentley (1836); J. Mähly, Richard Bentley, eine Biographie (1868); R. C. Jebb, Bentley ("English Men of Letters" series, 1882), where a list of authorities bearing on Bentley's life and work is given. For his letters see Bentley et doctorum variorum ad eum Epistolae (1807). The Correspondence of Richard Bentley, edited by C. Wordsworth (1842). See also J. E. Sandys, History of Classical Scholarship, ii. 401-410 (1906); and the Bibliography of Bentley, by A. T. Bartholomew and J. W. Clark (Cambridge, 1908).

BENTLEY, RICHARD (1704-1871), British publisher, was born in London in 1704. His father owned the General Evening Post in conjunction with John Nichols, to whom Richard Bentley, on leaving St Paul's school, was apprenticed to learn the printing
trade. With his brother Samuel (1782–1868), an antiquarian of some repute, he set up a printing establishment, but in 1839 he began business as a publisher in partnership with Henry Colburn in New Burlington Street. Colburn retired in 1832 and Benton continued business on his own account. In 1837 he began *Bentley's Miscellany*, edited for the first three years of its existence by Charles Dickens, whose *Oliver Twist*, with Cruikshank's illustrations, appeared in its pages. Bentley and his son George (1828–1895), as Richard Bentley & Son, published works by R. H. Barham, Theodore Hook, Isaac D'Israeli, Judge Haliburton and others; also the "Library of Standard Novels" and the "Favourite Novel Library." In the latter series Mrs Henry Wood's *East Lynne* appeared. In 1866 the firm took over the publication of *Temple Bar*, with *Bentley's Miscellany* was afterwards incorporated. Richard Bentley died on the 10th of September 1871. His son, George Bentley, and his grandson, Richard Bentley, junior, continued the business until it was absorbed (1898) by Macmillan & Co.

See also *R. Bentley & Son* (Edinburgh, 1886), a history of the firm reprinted from *Le Livre* (October, 1885).

**BENTON, THOMAS HART** (1782–1858). American statesman, was born at Hillsborough, Orange county, North Carolina, on the 14th of March 1782. His father, an Englishman of refinement and scholarship, died in 1790, leaving the boy under the influence of a very superior mother, from whom he received lessons in book learning, piety and temperance quite unusual in the frontier country. His home studies, facilitated by his father's fine library, were supplemented by a brief stay at the university of North Carolina (Chapel Hill) in 1799. The family removed, probably in this year, to a large tract of land which had been acquired by the father on the outskirts of the Indian country (at Benton Town, now Leipers Fork) near Franklin, Tennessee. The following years, during which Benton was at various times school teacher, farmer, lawyer and politician, were the distinctively formative period of his life. His intense democracy and many features of his boldly cast personality were perfectly representative of the border people among whom he lived; although his education, social standing and force of character placed him above his fellows. In 1809 he served a term as state senator. Between 1815 and 1817 he transferred his interests to St Louis, Missouri, and in 1820 was elected United States senator from the new state. His senatorial career of thirty years (1821–1851) was one of extreme prominence. A friendship early formed in Tennessee for Andrew Jackson was broken in 1814 by an armed fracas between the principals and their friends, but after the presidential election of 1824 Benton became a Jacksonian Democrat and Jackson's close friend, and as such was long the Democratic leader in the Senate, his power being greatest during Jackson's second term. He continued to be the administration's right-hand man under Van Buren, but gradually lost influence under Polk, with whom he finally broke both personally and politically.

The events of Benton's political life are associated primarily with three things: the second United States Bank, westward expansion and slavery. In the latter struggle over the bank, the deposits and the "expanding resolution" (i.e. the resolution to expunge from the records of the Senate the vote of censure of President Jackson for his removal of the government deposits from the bank), Benton led the Jackson Democrats. His opposition to a national bank and insistence on the peculiar virtues of "hard money," whence his sobriquet of "Old Bullion," went back to his Tennessee days. In all that concerned the expansion of the country and the fortunes of the West no public man was more consistent or more influential than Benton, and none so clear of vision. Reared on the border, and representing a state long the farthest outpost across the Mississippi in the Indian country, he held the ultra-American views of his section as regarded foreign relations generally, and the "manifest destiny" of expansion westward especially. It was quite natural that he should advocate the removal westward of the Indian tribes, should urge the encouragement of trade with Santa Fe (New Mexico), and should oppose the abandonment in the Spanish

treaty of 1819 of American claims to Texas. He once thought the Rocky Mountains the proper western limit of the United States (1834), but this view he soon outgrew. He was the originator of the policy of homestead laws by which the public lands were used to promote the settlement of the west by homeseekers. No other man was so early and so long active for transcontinental railways. But Benton was not a land-grabber, whether in the interest of slavery or of mere jingoism. In the case of Oregon, for instance, he was firmly against joint occupation with Great Britain, but he was always for the boundary of 49° and never joined in the campaign-ingo cry of "Fifty-four Forty or Fight." It was he who chiefly aided Polk in withdrawing from that untenable position. He despised pretexts and intrigues. Both in the case of Oregon and in that of Texas, though one of the earliest and most insistent of those who favoured their acquisition, yet in the face of southern and western sentiment he denounced the sordid and devious intrigues and politics connected with their acquisition, and kept clear of these. For the same reason he opposed the Mexican War, though not its prosecution once begun. In the Texas question slavery was prominent. Towards slavery Benton held a peculiarly creditable attitude. A southerner, he was a slaveholder, but he seems to have gradually learned that slavery was a curse to the South, for in 1844 he declared that he would not introduce it into Texas lands "where it was never known," and in 1849 proclaimed that his personal sentiments were "against the institution of slavery." In the long struggle over slavery in the territories, following 1845, he was for the extreme demands of neither section; not because he was timorous or a compromiser, —no man was less of either,—but because he stood unwaveringly for justice to both sections, never adopting exaggerated views that must or even could be compromised. The truth is that he was always a westerner before he was a southerner and a union man before all things else; he was no whit less national than Webster. Hence his distrust and finally hatred of Calhoun, dating from the nullification episode of 1832–1833. As the South under Calhoun's lead became increasingly sectional and aggressive, Benton increasingly lost sympathy with her. Though he despised political inaction Abolitionists, and hated their propaganda as inimical to the Union, he would not therefore close the national mails to Abolition literature, nor abridge the right of petition. No statesman was more prescient of the disunion tendencies of Calhoun's policies, and as early as 1844 he prophetically denounced the treason to the Union toward which the South was drifting. He would not drift with her for the sake of slavery, and this was his political undoing. In 1851 Missouri rejected him in his sixth candidacy for the Senate, after he had been an autocrat in her politics for thirty years. In 1852 he was elected to the House of Representatives, but his opposition to the repeal of the Missouri Compromise caused his defeat in 1854. An unsuccessful campaign for the governorship of Missouri in 1856 ended his political career. He died at Washington on the 10th of April 1858.

Benton's entire career was eminently creditable, and he is, besides, one of the most picturesque figures in American political life. His political developing, whether as regarded lobbying, congressional jobbing, civil service and the continuous issue of legislation and foreign affairs—were of the highest. He was so independent that he had great dislike for caucuses, and despised party platforms—although he never voted any but the Democratic ticket, even when his son-in-law, J. C. Frémont, was the Republican presidential candidate in 1856; nor would he accept instructions from the Missouri legislature. His career shows no truckling to self-interest, and on large issues he outgrew partisanship. Although palpably inferior to each of his great senatorial colleagues, Webster, Clay and Calhoun, in some gifts, yet if character, qualities and career be taken in the whole he was possibly the most creditable of all. Benton was austere, aggressive and vain; besides, he had a fatal deficiency of humour. Nevertheless he had great influence, which was a deserved tribute to his ability and high character. An indefatigable student, he treated all subjects capably, and especially in questions of his country's
BENTON HARBOR—BENZALDEHYDE

754

BENTON, a city of Berrien county, Michigan, U.S.A., on the Saint Joseph river, about 1 m. from Lake Michigan (with which it is connected by a ship canal), near the S.W. corner of the state, and 1 m. N.E. of St. Joseph. Pop. (1890) 3692; (1900) 6562, density 795. Benton Harbor was incorporated as a city in 1861. It is connected by the Pere Marquette, the Michigan Central and the Cleveland, Cincinnati, Chicago & St. Louis railways, by electric railways to St. Joseph and Niles, Mich., and South Bend, Indiana, and for a part of the year by steamboat lines to Chicago and Milwaukee. One mile south-east of the city are a sanitary and the Eastman mineral springs; within the city also are springs and bath-houses. Near the city is a communistic religious community, the Israelite House of David, founded in 1903; the members believe that they are a part of the 144,000 elect (Revelation, vii, xiv) ultimately to be redeemed. Benton Harbor has a large trade in fruit (peaches, grapes, pears, cherries, strawberries, raspberries and apples) and other market garden produce raised in the vicinity. The city's manufactures include fruit baskets, preserved fruits, cider, vinegar, pickles, furniture, lumber and stationers' supplies, particularly material for the "louse-leaf ledger" system of accounting. Benton Harbor, which was known as Bronson Harbor until 1893, was incorporated as a village in 1860, was chartered as a city in 1891, and in 1903 received a charter as a city. Benton Harbor is a river of West Africa, the largest and most important affluent of the Niger (q.v.), which it joins after a course of over 800 m. in a general east to west direction from its source in the mountains of Adamawa. Through the Tumbiri marshes there is a water connection between the Benue (Niger) and Shari (Lake Chad) systems.

BEN VENUE, a mountain in south-west Perthshire, Scotland, 10 m. W. of Callander. Its principal peaks are 2303 and 2386 ft. high, and, owing to its position near the south-eastern shore of Loch Katrine, its imposing contour is one of the most familiar features in the scenery of the Trossachs, the mountain itself figuring prominently in The Lady of the Lake. On its northern base, close to the lake, Sir Walter Scott placed the Cairn-an-Uriskin, or "Goblin's Cave." Immediately to the south of the cave is the so-called Baaichnam-Bo, or "Cattle Pass," through which were driven to the refuge of the Trossachs the herds marauded by the Highland raiders in their excursions to the lands south of Loch Lomond. The pass, though comparatively unvisited, offers the grandest scenery in the district.

BENZALDEHYDE (oil of bitter almonds), C6H5CHO, the simplest representative of the aromatic aldehydes. It was first isolated in 1803 and was the subject of an important investigation by J. v. Liebig in 1837 (Annalen, 1837, 22, p. 1). It occurs naturally in the form of the glucoside amygdalin (C12H20NO5), which is present in bitter almonds, cherries, peaches and the leaves of the cherry laurel; and it is obtained from this substance by hydrolysis with dilute acids:

\[
\text{C}_6\text{H}_5\text{NO}_5 + 2\text{H}_2\text{O} = \text{HCN} + 2\text{C}_2\text{H}_5\text{OH} + \text{CH}_3\text{CHO}
\]

It occurs free in bitter almonds, being formed by an enzyme decomposition of amygdalin (q.v.). It may also be prepared by oxidizing benzyl alcohol with concentrated nitric acid; by distilling a mixture of calcium benzoate and calcium formate; by the condensation of chlor-oxalic ester with benzine in the presence of aluminium chloride, the ester of the ketoic acid formed being then hydrolysed and the resulting acid distilled:

\[
\text{C}_6\text{H}_5\text{Cl} + \text{CO} + \text{COOH}_2\text{H}_4 = \text{C}_6\text{H}_5\text{COOH} + \text{H}_2\text{O} + \text{CH}_3\text{CHO} + \text{CO}_2
\]

by the action of anhydrous hydrocyanic acid and hydrochloric acid on benzene, an aldehyde being formed as an intermediate product:

\[
\text{C}_6\text{H}_5\text{CHO} + \text{HCN} + \text{HCl} = \text{C}_6\text{H}_5\text{CH}_2\text{CH} = \text{NH} + \text{H}_2\text{O}
\]

Benzaldehyde hydrochloride

Benzaldehyde is a colourless liquid smelling of bitter almonds. Its specific gravity is 1.0636 (°C.), and it boils at 179° C. (751-3 mm). It is only slightly soluble in water, but is readily volatile in steam. It possesses all the characteristic properties of an aldehyde; being readily oxidized to benzoic acid; reducing solutions of silver salts; forming addition products with hydrogen, hydrocyanic acid and sodium bisulphite; and giving an oxime and a hydrazine. On the other hand, it differs from the aliphatic aldehydes in many respects; it does not form an addition product with ammonia but condenses to hydrobenzamidine (C6H5CH2N); on shaking with alcoholic potash it undergoes simultaneous oxidation and reduction, giving benzoic acid and benzy alcohol (S. Cannizzaro); and on warming with alcoholic potassium cyanide it condenses to benzoic (q.v.).

The oxidation of benzaldehyde to benzoic acid when exposed to air is not one of ordinary oxidation, for it has been observed in the case of many compounds that during such oxidation, as much oxygen is rendered "active" as is used up by the substance undergoing oxidation; thus if benzoic acid is left for some time in contact with air, water and indigousulphonic acid, just as much oxygen is used up in oxidizing the indigo compound as in oxidizing the aldehyde. A. v. Baeyer and V. Villiger (Berichte, 1900, 33, pp. 858, 2486) have shown that benzoyl hydrogen peroxide C6H5CO-O-OH is formed as an intermediate product and that this oxidizes the indigo compound, being itself reduced to benzoic acid; they have also shown that this peroxide is soluble in benzaldehyde with production of benzoic acid, and it must be assumed that the oxidation of benzaldehyde proceeds as shown in the equations:

\[
\text{C}_6\text{H}_5\text{CHO} + \text{O}_2 = \text{C}_6\text{H}_5\text{CO}_2\text{H} + \text{CH}_3\text{CHO} = 2\text{HC}_6\text{H}_5\text{COOH}
\]

The oxime of benzaldehyde (C6H5CH=N=O), formed by the addition of hydroxylamine to the aldehyde, exhibits a characteristic behaviour when benzaldehyde acid gas is passed into its solution, a second modification being produced. The former (known as the α or benz-anti-aldoxime) melts at 34-35° C.; the latter (β or benz-syn-aldoxime) melts at 130° C. and is slowly transformed into the α form. The difference between the two forms has been explained by A. Hantsch and A. Werner (Berichte, 1890, 23, p. 11) by the assumption of the different spatial arrangement of the atoms (see Stereo-Isomerism). On account of the readiness with which it condenses with various compounds, benzaldehyde is an important synthetic reagent. With aniline it forms benzaldehyde aniline C6H5CH2N=nH; and with acetone, benzal acetone C6H5CH:CH:CO-CH3. Heated with anhydrous sodium acetate and acetic anhydride it gives cinnamic acid (q.v.); with ethyl bromide and sodium it forms triphenyl-carbinol.
(C₆H₅)₂C=O; with dimethylaniline and anhydrous zinc chloride, it forms leuco-malachite green C₆H₅CH(C₆H₅N(CH₃)₂)₂; and with dimethylaniline and concentrated hydrochloric acid it gives dimethylanilinobenzhydrol, C₆H₅(CH₂O)(OH)C₆H₅N(CH₃)₂. Heated with sulphur it forms benzoic acid and stilbene:

\[ 2C₆H₅O⁻+S=C₆H₅COOH+C₆H₅CHS₂C₆H₅CHO = C₆H₅C=N⁻+C₆H₅CH₂S₂C₆H₅ \]

Its addition compound with hydrocyanic acid gives mandelic acid C₆H₅CH(OH)COOH on hydrolysis; when heated with sodium succinate and acetic anhydride, phenyl-isocrotonic acid C₆H₅C=CH₂COOH is produced, which on boiling is converted into a-naphthol C₆H₅OH. It can also be used for the synthesis of pyridine derivatives, since A. Hantzsch has shown that aldehydes condense with aceto-acetic ester and ammonia to produce the homologues of pyridine, thus:

\[ \text{ROOC-CH₂} + \text{CH₃CHOOROOCC-CH₃} = \text{H₃C-O-C₆H₅} + \text{H₃C-NH-C₆H₅} \]

On nitration it yields chiefly meta-nitro-benzaldehyde, crystallizing in needles which melt at 58°C. The ortho-compound may be obtained by oxidizing ortho-nitroacetic acid with alkaline potassium permanganate in the presence of benzene; or from ortho-nitrobenzyl chloride by condensing it with aniline, oxidizing the product so obtained to ortho-nitrobenzaldehyde, and then hydrolysing this compound with an acid (Farbenfabrik d. Meister, Lucas und Brüning). It crystallizes in yellowish needles, which are volatile in steam and melt at 46°C. It is used in the artificial production of indigo (see German Patent 19768).

Para-nitrobenzaldehyde crystallizes in prisms melting at 107°C and is prepared by the action of chromium oxychloride on para-nitrotoluene, or by oxidizing para-nitroacetic acid. By the reduction of ortho-nitrobenzaldehyde with ferrous sulphate and ammonia, ortho-amino-benzaldehyde is obtained. This compound condenses in alkaline solution with compounds containing the grouping -CH₂- into form quinoline (q.v.) or its derivatives; thus, with acetophenone it forms quinoline, and with acetone, α-methyl quinoline. With urea it gives quinazoline

\[ \text{CH}_3\text{NCH}_3\text{CO} \]

**BENZENE**. C₆H₆, a hydrocarbon discovered in 1825 by Faraday in the liquid produced in the compression of the illuminating gas obtained by distilling certain oils and fats. E. Mitscherlich prepared it in 1834 by distilling benzoic acid with lime; and in 1845 Hofmann discovered it in coal-tar. It was named “benzin” or “benzyne” by Mitscherlich in 1833, but in the following year Liebig proposed “benzol” (the termination of being suggested by the Lat. oleum, oil); the form “benzene” was due to A. W. Hofmann. The word “benzine” is sometimes used in commerce for the coal-tar product, but also for the light petroleum better known as petroleum-benzene; a similar ambiguity is presented by the word “benzoline,” which is applied to the same substances as the word “benzene.” “Benzene” is the term used by English chemists, “benzol” is used in Germany, and “benzole” in France.

Benzene is manufactured from the low-boiling fractions of the coal-tar distillate (see Coal-Tar). The first successful fractionation of coal-tar naphtha was devised by C. B. Mansfield (1819-1835), who separated a benzol distilling below 100°C from a less volatile naphtha by using a simple dephlegmator. At first, the oil was manufactured principally for combustion in the Read-Holliday lamp and for dissolving rubber, but the development of the coal-tar colour industry occasioned a demand for benzene of definite purity. In the earlier stages 30%, 50% and 90% benzols were required, the 30% being mainly used for the manufacture of “aniline for red,” and the 50% for “aniline for blue.” (The term “30% benzol” means that 30% by volume distils below 100°C.) A purer benzol was subsequently required for the manufacture of aniline black and other dye-stuffs. The process originally suggested by Mansfield is generally followed, the success of the operation being principally conditioned by the efficiency of the dephlegmator, in which various improvements have been made. The light oil fraction of the coal-tar distillate, which comes over below 140°C and consists principally of benzene, toluene and the xylenes, yields on fractional (1) various volatile impurities such as carbon disulphide, (2) the benzene fraction boiling at about 80°C, (3) the toluene fraction boiling at 100°C, (4) the xylene fraction boiling at 140°C. The fractions are agitated with strong sulphuric acid, and then washed with a caustic soda solution. The washed products are then redistilled.

The benzene fraction requires a more thorough washing with sulphuric acid in order to eliminate the toluene, which is sulphurized more readily than benzene.

Benzene is a colourless, limpid, highly refracting liquid, having a pleasing and characteristic odour. It may be solidified to rhombic crystals which melt at 5°-5°C. (Mansfield obtained perfectly pure benzene by freezing a carefully fractionated sample.) It boils at 80-4°C, and the vapour is highly inflammable, the flame being extremely smoky. Its specific gravity is 0.89 at 0°C. It is very slightly soluble in water, more soluble in alcohol, and completely miscible with ether, acetic acid and carbon disulphide. It is an excellent solvent for gums, resins, fats, &c.; sulphur, phosphorus and iodine also dissolve in it. It sometimes separates with crystals of a solute as “benzene of crystallization,” as for example with triphenylmethane, thio-p-tolyl urea, tropine, &c.

Benzene is of exceptional importance commercially on account of the many compounds derivable from it, which are exceedingly valuable in the arts. Chemically it is one of the most interesting substances known, as it is the parent of the enormous number of compounds styled the “aromatic” or “benzenoid” compounds. The constitution of the benzene ring, the isomerism of its derivatives, and their syntheses from aliphatic or open-chain compounds, are treated in the article Chemistry. A summary of its chemical transformations may be given here, and reference should be made to the articles on the separate compounds for further details.

Passed through a red-hot tube, benzene vapour yields hydrogen, diphenyl, diphenylbenzenes and acetylene; the formation of the last compound is an instance of a reversible reaction, since Berthelot found that acetylene passed through a red-hot tube gave some benzene. Benzene is very stable to oxidants, in fact resistance to oxidation is a strong characteristic of the benzene ring. Manganese dioxide and sulphuric acid oxidize it to benzoic and o-phthalic acid; potassium carbonate and sulphuric acid breaks the ring; and ozone oxidizes it to the highly explosive white solid known as ozogen-benzene, C₆H₅O₃. Hydrochloric acid reduces it to hexamethylen (cyclo-hexene or hexa-hydro-benzene); chlorine and bromine form substitution and addition products, but the action is slow unless some carrier such as iodine, molybdenium chloride or ferric chloride for chlorine, and aluminium bromide for bromine, be present. It is readily nitrated to nitro-benzene, two, and even three nitro groups being introduced if some dehydrator such as concentrated sulphuric acid be present. Sulphuric acid gives a benzene sulphonic acid.

**BENZIDINE** (Dipara-diimino-diphenyl). NH₂C₆H₄NH₂C₆H₄NH₂, a chemical base which may be prepared by the reduction of the corresponding diimino-diphenyl, or by the reduction of azo-benzene with tin and hydrochloric acid. In this latter case hydroazo-benzene C₆H₅N₂H₂C₆H₄N₂H₂ is first formed and then undergoes a peculiar re-arrangement into benzidine (see H. Schmidt and G. Schulte, Annalen, 1881, 207, p. 320; O. N. Witter and H. H. Helfman, Berichte, 1887, 21, p. 235; P. J. Harrison, Berichte, 1892, 25, p. 994). Benzidine crystallizes in plates (from water) which melt at 129°C, and boil above 360°C, and is characterized by the great insolubility of its sulphate. It is a di-acid base and forms salts with the mineral acids. It is readily
Benzoic acid being subsequently hydrolysed; and similarly from benzene and chlorformamide:

\[
\text{C}_6\text{H}_5\text{Cl-CONH}_2 = \text{HCl} + \text{C}_6\text{H}_5\text{CONH}_2
\]

the benzamide being then hydrolysed. It may also be prepared by boiling benzyl chloride with dilute nitric acid (G. Lunge, *Berichte*, 1877, 10, p. 1275); by fusing sodium benzene sulphonate with sodium formate: \(\text{C}_6\text{H}_5\text{SO}_3\text{Na} + \text{HCO}_2\text{Na} = \text{C}_6\text{H}_5\text{COONa} + \text{NaHSO}_3\); by heating calcium phosphate with calcium hydroxide to \(330^\circ\text{C}\); by heating benzotrichloride with water in a sealed tube, and from the hydrochloric acid which is found in the urine of the herbivore. For this purpose the urine is concentrated and the hippuric acid precipitated by the addition of hydrochloric acid; it is then filtered and boiled for some time with concentrated hydrochloric acid, when it is hydrolysed into benzoic and amido-acetic acid. It is made commercially by boiling benzotrichloride (obtained from toluene) with milk of lime, the calcium benzoate so obtained being then decomposed by hydrochloric acid

\[
2\text{C}_6\text{H}_5\text{Cl} + 4\text{Ca(OH)}_2 = (\text{C}_6\text{H}_5\text{COO})_2\text{Ca} + 3\text{CaCl}_2 + 4\text{H}_2\text{O}
\]

Benzoic acid crystallizes in glistening leaflets (from water) which melt at \(121^\circ\text{C}\) and boil at \(240^\circ\text{C}\) (H. Kopp). Its specific heat is \(0.1046\). It sublimes readily and is volatile in steam. It is readily soluble in hot water and the ordinary organic solvents, but is only slightly soluble in cold water. When heated with lime, it is decomposed, benzene being formed; if its vapours are passed over heated zinc dust, it is converted into benza-lyde (A. Baeyer, *Ann.* 1886, 1450, p. 296). Distillation of its calcium salt gives benzophenone (\(q.s\)) with small quantities of other substances, but if the calcium salt be mixed with calcium formate and the mixture distilled, benza-lyde is produced. By the action of sodium amalgam on an aqueous solution of the acid, benzy alcohol, tetrahydrobenzoic acid and hexahydro-benzoic acid are formed. The salts of benzoic acid are known as the benzoates and are mostly soluble in water. They are readily decomposed by mineral acids with the production of benzoic acid, and on addition of ferric chloride to their neutral solutions give a reddish-brown precipitate of ferric benzoate.

Benzoic anhydride, \((\text{C}_6\text{H}_5\text{CO})_2\text{O}\), is prepared by the action of benzoic chloride on sodium benzoate, or by heating benzoic chloride with anhydrous oxalic acid (R. Anschütz, *Ann.* 1884, 253, p. 296). It crystallizes in needles, melting at \(42^\circ\text{C}\), and boiling at \(350^\circ\text{C}\). It is insoluble in water but readily soluble in alcohol and ether.

Benzoyl chloride, \(\text{C}_6\text{H}_5\text{COCl}\), is formed by distilling a mixture of phosphorus pentachloride and benzoic acid; by the action of chlorine on benza-lyde, or by passing a stream of hydrochloric acid gas over a mixture of benzoic acid and phosphorus pentoxide heated to \(200^\circ\text{C}\). (C. Friedel, *Ber.* 1896, 2, p. 86). It is a colourless liquid of very unpleasant smell, which boils at \(105^\circ\text{C}\), and solidifies in a freezing mixture, the crystals obtained melting at \(-1^\circ\text{C}\). It shows all the characteristic properties of an acid chloride.

Ethyl benzoate, \(\text{C}_6\text{H}_5\text{COOC}_2\text{H}_5\), is best prepared by boiling benzoic acid and alcohol with a small quantity of sulphuric acid for some hours (E. Fischer and A. Speier, *Berichte*, 1896, 28, p. 3252). It is a colourless liquid of boiling point \(213^\circ\text{C}\). Benzanilide, \(\text{C}_6\text{H}_5\text{CONH}_2\), is prepared by the action of benzoic chloride on ammonia or ammonium carbonate, or from ethyl benzoate and ammonia. It crystallizes (from water) in glistening leaflets which melt at \(136^\circ\text{C}\) and boil at \(288^\circ\text{C}\). Its silver salt behaves as if it were the salt of an imido benzoic acid, since it yields benzamidine, \(\text{C}_6\text{H}_5\text{N}=\text{NC}_2\text{H}_5\), with ethyl iodide (J. Tafel and C. Enoch, *Berichte*, 1889, 23, p. 1525).

Chlor-, brom-, iodo- and fluoro-benzoic acids are known and can be obtained by oxidizing the corresponding halogen toluenes, or from the amido acids, or by substitution. Nitration of benzoic acid gives chiefly meta-nitro-benzoic acid. The ortho- and para-nitro-benzoic acids can be obtained by oxidizing ortho- and para-nitro-cinnamic acids. Ortho-amino-benzoic acid, \(\text{C}_6\text{H}_5\text{NH}_2\text{COOH}\) (anthranilic acid), is closely related to indigo (\(q.s\)).
Gum benzoin, which contains from 12 to 20% of benzoic acid, is used in medicine as the essential constituent of benzoezated lard, Adops benzoaitus, which owes its antiseptic properties to benzonic acid; and in friar's balsam, Tinctoria benzoiniz composite, which is an ancient and valuable medicament, still largely used for inhalation in cases of laryngitis, bronchitis and other inflammatory or actually septic conditions of the respiratory tract. It owes its value to the benzoic acid which it contains. A fluid drachm of friar's balsam may be added to a pint of water at a temperature of about 145°C., and the resultant vapour may be inhaled from the spout of a kettle or from a special inhaler. Benzonic acid itself, ammonium benzoate and sodium benzoate are all administered internally in doses of from five to thirty grains. The ammonium salt is most often employed, owing to the stimulant character of the ammonium base. The acid itself is a powerful antiseptic. When administered internally, it causes the appearance of hippuric acid in the urine. This is due to its combination in the body with glycocoll. The combination probably occurs in the kidney. The hippuric acid in the urine acts as a stimulant and disinfectant to the urinary mucous membrane. Benzonic acid is also excreted by the bronchial and tends to disinfect and stimulate the bronchial mucous membrane. Hence the value of friar's balsam. The acid and its salts are antipyretic and were used in Germany instead of salicylates in rheumatic fever. But the most important fact is that benzoe is largely used—on account of its power to form oxides with urinary anodises such as tincture of hyoscyamus—as a urinary antiseptic in cases of cystitis (inflammation of the bladder) and pyelitis (inflammation of the pelvis of the kidney).

BENZOIN, C₆H₅CHOH-CO-C₆H₅, a ketone-alcohol, which may be prepared by boiling an alcoholic solution of benzaldehyde with potassium cyanide; by reducing benzil (C₆H₅CHOH-CO-C₆H₅) with zinc and acetic acid; or by the oxidation of hydrobenzoin (C₆H₅CHOH-CHOH-C₆H₅). It is a colourless, crystalline solid, readily soluble in alcohol and ether, melting at 137°C. and boiling at 334°C. On passing the vapour of benzoin over heated lead oxide, it is converted into benzil and benzophenone. Owing to the readiness with which it is oxidized, it acts as a reducing agent, giving a red precipitate of cuprous oxide with FeHing's solution in the cold. Chlorine and nitric acid oxidize it to benzaldehyde, chromic acid mixture and potassium permanganate, to benzoic acid and carbon. On hydrolysis benzoin is converted into benzaldehyde and water. Benzoin is synthesized by treating glycine with sodium benzoate (C₆H₅CHOH-CHOH-C₆H₅) is obtained; sodium amalgam converts it into hydrobenzoin; and fuming hydrochloric acid at 130°C. gives dibenzyl (C₆H₅CH₂-C₆H₅) by fusion with alkali it is converted into benzil; and with an alcoholic solution of benzaldehyde in presence of ammonia it forms amarine (triphenyl dihydro-glyoxaline). In the presence of sulphuric acid it condenses with nitriles to oxazoles (p.v.).

BENZOIN, or Gum BENJAMIN (supposed to be from Arab. luban, frankincense, the first syllable being dropped in Roman as if it were the article), a balsamic resin obtained from Styrax benzoin, a tree of considerable size, native to Sumatra and Java, and from other species of Styrax. It is obtained by making incisions in the bark of the tree, and appears to be the result of the wound, not to be secreted normally. There are several varieties of benzoin in commerce: (1) Siam benzoin, which apparently does not come from Styrax benzoin, is the finest and most aromatic, and occurs in the form of small "tears," rarely exceeding 2 in. in length by 1/2 in. in thickness, and of "blocks" made up of these tears agglomerated by a clear reddish-brown resin. The odour of Siam benzoin is partly due to the presence of vanillin, and the substance contains as much as 35% of benzoic acid but no cinnaamic acid. (2) Sumatra benzoin occurs only in masses formed of dull red resin enclosing white tears. It contains about 20% of cinnaamic acid in addition to benzoin occurring in 18 or even more of benzoin. (3) Palembali benzoin, an inferior variety, said to be obtained from Styrax benzoin in Sumatra, consists of greyish translucent resinous masses, containing small white opaque tears. It does not appear to contain cinnaamic acid. Large quantities of benzoin are used as incense. Its medicinal uses depend on the contained benzoic acid (p.v.).

BENZOPHENE (Diphenyl Ketone), C₆H₅CO-C₆H₅, the simplest representative of the true aromatic ketones. It may be prepared by distilling calcium benzate; by condensing benzene with benzyl chloride in the presence of anhydrous aluminium chloride; by the action of mercury diphenyl on benzyl chloride, or by oxidizing diphenylmethane with chromic acid. It is a dimorphous substance existing in two enantiomeric forms, one melting at 26°C. and the other at 48°C. (Th. Zinke, Berichte, 1871, 4, p. 576). It boils at 306°C. under a pressure of 750-12 mm. It is reduced by sodium amalgam to benzylalcohol or diphenyl carbinal C₆H₅-CHOH-C₆H₅; a stronger reducing agent, such as hydriodic acid in the presence of amorphous phosphorus converts it into diphenylmethane (C₆H₅)₂CHO. Potash fusion converts it into benzene and benzoic acid. With phenylhydrazine it forms a hydrazone, and with hydroxylamine an oxime, which exists in one form only; if, however, one of the phenyl groups in the oxime is substituted in any way then two stereo-isomeric oximes are produced (cf. Stereo-Isomerism); thus parachlorobenzophenone oxime exists in two different forms (V. Meyer and K. F. Auwers, Berichte, 1859, 23, p. 2403). Many derivatives are known, thus ortho-amino-benzophenone, melting at 106°C., can be obtained by reduction of the corresponding nitro compound; it condenses under the influence of heated lead monoxide to an acridine derivative, and with acetone in presence of caustic soda it gives a benzaldehyde. Tetramethyl-diamido-benzophenone or Michler's ketone, COCH₅N(CH₃)₂, melting at 173°C., is of technical importance, as by condensation with various substances it can be made to yield dye-stuffs. It is prepared by the action of carbonyl chloride on dimethyl aniline in the presence of aluminium chloride: COCl₂+2C₆H₅N(CH₃)₂=2HCl+CO(C₆H₅N(CH₃))₂.

BENZYL ALCOHOL (Phenyl Carbinal), C₆H₅CH₂OH, occurs as a benzoic ester in Peruvian balsam, as cinnamic ester in Tolu balsam, as acetic ester in essential oil of jasmine, and also in stoean. It may be synthetically prepared by the reduction of benzyl chloride; by the action of nitrous acid on benzyllamine; by boiling benzyl chloride with an aqueous solution of potassium carbonate, or by the so-called "Cannizzaro" reaction, in which benzaldehyde is shaken up with caustic potash, one half of the aldehyde being oxidized to benzoic acid, and the other half reduced to the alcohol. (Berichte, 1881, 14, p. 2394). 20C₆H₅CHOH KOH = C₆H₅CH₂OH. It is a colourless liquid, with a faint aromatic smell, and boils at 206°C. On oxidation with nitric acid it is converted into benzaldehyde, whilst chromic acid oxidizes it to benzoic acid. Reduction by means of hydriodic acid and phosphorus at 140°C. gives toluene, whilst on distillation with alcoholic potash, toluene and benzoic acid are formed.

BETHVUK, a tribe of North American Indians formerly dwelling in the interior of Newfoundland. A certain mystery attaches to them, since investigation of the few words of their language which have survived suggests that they were of distinct stock. The name of Micmac origin) is said to mean simply "red men." They were bitterly hostile to the French settlers, and were hunted down and killed off until 1820, when a few survivors made their escape into Labrador. The last of them is believed to have died in 1830.

BETHVUK, ODON (1796-1874), Hungarian deputy and orator, was a great Grosswarden, his father being a retired officer and deputy lord-lieutenant of the county of Bihar. At the age of sixteen he served in the war against Napoleon, and was present at the great battle of Leipzig. Like so many others of his compatriots, he picked up Liberal ideas abroad. He was sent to parliament by his county in 1826 and again in 1830, but did not become generally known till the session of 1832-1836, when along with Deák he, as a liberal Catholic, defended the Protestant point of view in "the mixed marriages question." He was also an energetic advocate of freedom of speech. After parliament rose he carried his principles to their logical conclusion by marrying a Protestant lady and, being denied a blessing on the occasion by an indignant bishop, publicly declared that he could very well dispense with such blessings. In 1841 he was elected deputy lord-lieutenant of his county to counteract the influence of the
BEOWULF

The epic of Beowulf, the most precious relic of Old English, and, indeed, of all early Germanic literature, has come down to us in a single MS., written about A.D. 1000, which contains also the Old English poem of Judith, and is bound with other MSS. in a volume in the Cottonian collection now at the British Museum. The subject of the poem is the exploits of Beowulf, son of Ecgtheow and nephew of Hygelac, king of the “Géatas,” i.e. the people, called in Scandinavian records Gautar, from whom a part of southern Sweden has received its present name Götland.

The Story.—The following is a brief outline of the story, which naturally divides itself into five parts.

1. Beowulf, with fourteen companions, sails to Denmark, to offer his help to Hrothgar, king of the Danes, whose hall (called “Heorot”) has for twelve years been rendered uninhabitable by the ravages of a devouring monster (apparently in gigantic human shape) called Grendel, a dweller in the waste, who used nightly to force an entrance and slay the inmates. Beowulf and his men are received in the long-deserted Heorot. At night the Danes withdraw, leaving the strangers alone. When all but Beowulf are asleep, Grendel enters the iron-barred doors having yielded in a moment to his hand. One of Beowulf’s friends is killed; but Beowulf, unarmed, wrestles with the monster, and tears his arm from the shoulder. Grendel, though mortally wounded, breaks from the conqueror’s grasp, and escapes from the hall. On the morrow, his bloodstream cleaned is followed until it ends in a distant mere.

2. All fear being now removed, the Danish king and his followers pass the night in Heorot, Beowulf and his comrades being lodged elsewhere. The hall is invaded by Grendel’s mother, who kills and carries off one of the Danish nobles. Beowulf proceeds to the mere, and, armed with sword and corselet, plunges into the water. In a vaulted chamber under the waves, he fights with Grendel’s mother, and kills her. In the vault he finds the corpse of Grendel; he cuts off the head, and brings it back in triumph.

3. Richly rewarded by Hrothgar, Beowulf returns to his native land. He is welcomed by Hygelac, and relates to him the story of his adventures, with some details not contained in the former narrative. The king bestows on him lands and honours, and during the reigns of Hygelac and his son Heardred he is the greatest man in the kingdom. When Heardred is killed in battle with the Swedes, Beowulf becomes king in his stead.

4. After Beowulf has reigned prosperously for fifty years, his country is ravaged by a fiery dragon, which inhabits an ancient burial-mound, full of costly treasure. The royal hall itself is burned to the ground. The aged king resolves to fight, unaided, with the dragon. Accompanied by eleven chosen warriors, he journeys to the barrow. Bidding his companions retire to a distance, he takes up his position near the entrance to the mound—an arched opening whence issues a boiling stream.

The dragon hears Beowulf’s shout of defiance, and rushes forth, breathing flames. The fight begins; Beowulf is all but overpowered, and the sight is so terrible that his men, all but one, seek safety in flight. The young Wiglaf, son of Weohstan, though yet untried in battle, cannot, even in obedience to his lord’s prohibition, refrain from going to his help. With Wiglaf’s aid, Beowulf slays the dragon, but before he has received his own death-wound. Wiglaf enters the barrow, and returns to show the dying king the treasures that he has found there. With his last breath Beowulf names Wiglaf his successor, and ordains that his ashes shall be enshrined in a great mound, placed on a lofty cliff, so that it may be a mark for sailors far out at sea.

5. The news of Beowulf’s dear-bought victory is carried to the army. Amid great lamentation, the hero’s body is laid on the funeral pile and consumed. The treasures of the dragon’s hoard are buried with his ashes; and when the great mound is finished, twelve of Beowulf’s most famous warriors ride around it, celebrating the praises of the bravest, gentlest and most generous of kings.

Historical Value.—Now, with one brilliant exception—the story of the swimming-match, which is felicitously introduced and finely told—these retrospective passages are brought in more or less awkwardly, interrupt inconveniency the course of the narrative, and are too condensed and allusive in style to make any strong poetic impression. Still, they do serve to complete the portraiture of the hero’s character. There are, however, many other episodes that have nothing to do with Beowulf himself, but seem to have been inserted with a deliberate intention of making the poem into a sort of cyclopædia of Germanic tradition. They include many particulars of what purports to be the history of the royal houses, not only of the Gautar and the Danes, but also of the Swedes, the continental
Angles, the Ostrogoths, the Frisians and the Heathobards, besides references to matters of unlocalized heroic story such as the exploits of Sigismund. The Saxons are not named, and the Franks appear only as a dreaded hostile power. Of Britain there is no mention; and though there are some distinctly Christian passages, they are so incongruous in tone with the rest of the poem that they must be regarded as interpolations. In general the extraneous episodes have no great appropriateness to their context, and have the appearance of being abridged versions of stories that had been related at length in poetry. Their confusing effect, for modern readers, is increased by a curiously irrelevant prelude. It begins by celebrating the ancient glories of the Danes, tells in allusive style the story of Scyld, the founder of the “Sceadling” dynasty of Denmark, and praises the virtues of his son Beowulf. If this Danish Beowulf had been the hero of the poem, the opening would have been appropriate; but it seems strangely out of place as an introduction to the story of his namesake.

However detrimental these redundancies may be to the poetic beauty of the epic, they add enormously to its interest for students of Germanic history or legend. If the mass of traditions which it purports to contain be genuine, the poem is of unique importance as a source of knowledge respecting the early history to the Anglo-Saxons. But the value to be assigned to Beowulf in this respect can be determined only by ascertaining its probable date, origin and manner of composition. The criticism of the Old English epic has therefore for nearly a century been justly regarded as indispensable to the investigation of Germanic antiquities.

The starting-point of all Beowulf criticism is the fact (discovered by N. F. S. Grundtvig in 1831) that one of the episodes of the poem belongs to authentic history. Gregory of Tours, who died in 594, relates that in the reign of Theodoric of Metz (511-534) the Danes invaded the kingdom, and carried off many captives and much plunder to their ships. Their king, whose name appears in the best MSS. as Chroclihac (other copies read Chroclihac, Hrodalacius, &c.), remained on shore intending to follow afterwards, but was attacked by the Franks under Theodert, son of Theodoric, and killed. The Franks then defeated the Danes in a naval battle, and recovered the booty. The date of these events is ascertained to have been between 512 and 520. An anonymous history written early in the eighth century, the Liber Historiae Francorum, cap. 100 gives the story of the Danish king as Chroclihac, and says that he was killed in the land of the Attoarii. Now it is related in Beowulf that Hygelac met his death in fighting against the Franks and the Hetrave (the Old English form of Attoarii). The forms of the Danish king’s name given by the Frankish historians are corruptions of the name of which the primitive Germanic form was Huglakaz, and which by regular phonetic change became in Old English Hygelac, and in Old Norse Hugleikr. It is true that the invading king is said in the histories to have been a Dane, whereas the Hygelac of Beowulf belonged to the “Geatas” or Gautar. But a work called Liber Monstrorum, preserved in two MSS. of the 10th century, cites as an example of extraordinary stature a certain “Hunglac, king of the Geatas,” who was killed by the Franks, and whose bones were preserved on an island at the mouth of the Rhine, and exhibited as a marvel. It is therefore evident that the personality of Hygelac, and the expedition in which, according to Beowulf, he died, belong not to the region of legend or poetic invention, but to that of historic fact.

This noteworthy result suggests the possibility that what the poem calls Hygelac’s largest and most important events of his reign and that of his successor, are based on historic fact. There is really nothing to forbid the supposition; nor is there any likelihood in the view that the persons mentioned as belonging to the royal houses of the Danes and Swedes had a real existence. It can be proved, at any rate, that several of the names are

1 Printed in Berger de Xivrey, Traditions Tératologiques (1836), from a MS. in private hands. Another MS., now at Wolfenbüttel, reads “Hunglæc” for “Hygelac,” and (ungrammatically) “gents” for “Gæts.”

derived from the native traditions of these two peoples. The Danish king Hrothgar and his brother Halga, the sons of Healfdene, appear in the Historia Danica of Saxo the Roe (the founder of Roskilde) and Helgo, the sons of Haldanus. The Swedish princes Eadgils, son of Othhere, and Onela, who are mentioned in Beowulf, are in the Icelandic Heimskringla called Adils son of Öttar, and Ali; the correspondence of the names, according to the phonetic laws of Old English and Old Norse, being strictly normal. There are other points of contact between Beowulf on the one hand and the Scandinavian records on the other, confirming the conclusion that the Old English poem contains much of the historical tradition of the Gautar, the Danes and the Swedes, in its purest accessible form.

Of the hero of the poem no mention has been found elsewhere. But the name (the Icelandic form of which is Björfr) is genuinely Scandinavian. It was borne by one of the early settlers in Iceland, and a monk named Biulti is commemorated in the Liber Vitæ of the church of Durham. As the historical character of Hygelac has been proved, it is not unreasonable to accept the authority of the poem for the statement that his nephew Beowulf succeeded Heordred on the throne of the Gautar, and interfered in the dynastic quarrels of the Swedes. His swimming exploit among the Franks, alluded to by Gregory of Tours, and perhaps his contest with Breca may have been an exaggeration of a real incident in his career; and even if it was originally related of some other hero, its attribution to the historical Beowulf may have been occasioned by his renown as a swimmer.

On the other hand, it would be absurd to imagine that the combats with Grendel and his mother and with the fiery dragon can be exaggerated representations of actual occurrences. These exploits belong to the domain of pure mythology. That they have been attributed to Beowulf in particular might seem to be adequately accounted for by the general tendency to connect mythical achievements with the name of some famous hero. There are, however, some facts that seem to point to a more definite explanation. The Danish king “Scyld Seafing,” whose story is told in the opening lines of the poem, and his son Beowulf, are plainly identical with Scyldewa, son of Sceaf, and his son Beawulf, who appear among the ancestors of Woden in the genealogy of the kings of Wessex given in the Old English Chronicle. The story of Scyld’s believing in his son Beowulf, by William of Malmesbury, and, less fully, by the 10th-century English historian Ethwelwer, though it is told not of Scyld himself, but of his father Sceaf. According to William’s version, Sceaf was found, as an infant, alone in a boat without oars, which had drifted to the island of “Scandza.” The child was asleep with his head on a sheaf, and from this circumstance he obtained his name. When he grew up he reigned over the Angles at “Scalthic.” In Beowulf the same story is told of Sceaf, with the addition that when he died his body was placed in a ship, laden with rich treasure, which was sent out to sea unguided. It is clear that in the original form of the tradition the name of the foundling was Scyld or Scyldewa, and that his cognomen Seafing (derived from “scaef, a sheaf”) was misinterpreted as a patronymic. Sceaf, therefore, is no genuine personage of tradition, but merely an etymological figment.

The position of Scyldewa and Beawulf (in Malmesbury’s Latin called Sceldius and Beowius) in the genealogy as anterior to Woden would not of itself prove that they belong to divine mythology and not to heroic legend. But there are independent grounds for believing that they were originally gods-gods. It is a reasonable conjecture that the tale of victories over Grendel and the fiery dragon belong properly to the myth of Beawulf. If Beowulf, the champion of the Gautar, had already become a theme of epic song, the resemblance of name might easily suggest the idea of enriching his story by adding to it the achievements of Beawulf. At the same time, the tradition that the hero of these adventures was a son of Scyld, who was identified (whether rightly or wrongly) with the eponym of the Danish dynasty of the Scyldings, may well have prompted the
supposition that they took place in Denmark. There is, as we shall see afterwards, some ground for believing that there were circulated in England two rival poetic versions of the story of the encounters with supernatural beings: the one referring them to Beowulf the Dane, while the other (represented by the existing poem) attached them to the legend of the son of Ecgtheow, but ingeniously contrived to do some justice to the alternative tradition by laying the scene of the Grendel incident at the court of a Scylding king.

As the name of Beaw appears in the genealogies of English kings, it seems likely that the traditions of his exploits may have been brought over by the Angles from their continental home. This supposition is confirmed by evidence that seems to show that the Grendel legend was popularly current in this country. In the schedules of boundaries appended to two Old English charters there occurs mention of places called "Grendel's mere," one in Wiltshire and the other in Staffordshire. The charter that mentions the Wiltshire "Grendel's mere" speaks also of a place called Beawo hám ("Beow's home"), and another Wiltshire charter has a "Scyld's tree" among the landmarks enumerated. The notion that ancient burial mounds were liable to be inhabited by dragons is common in the Germanic world: there is perhaps a trace of it in the Derbyshire place-name Drakelow, which means "dragon's barrow."

While, however, it thus appears that the mythic part of the Beowulf story is a portion of primeval Angle tradition, there is no proof that it was originally peculiar to the Angles; and even if it was so, it may easily have passed from them into the poetic cycles of the related peoples. There are, indeed, some reasons for suspecting that the blending of the stories of the mythic Beaw and the historical Beowulf may have been the work of Scandinavian and not of English poets. Prof. G. Sarrazin has pointed out the striking resemblance between the Scandinavian legend of Bödvar Biarki and that of the Beowulf of the poem. In each, a hero from Gautland slays a destructive monster at the court of a Danish king, and afterwards is found fighting on the side of Eastgilis (Adils) in Sweden. This coincidence cannot well be due to mere chance; but its exact significance is doubtful. On the one hand, it is possible that the English epic, which unquestionably derived its historical elements from Scandinavian song, may be indebted to some same source for its general plan, including the blending of history and myth. On the other hand, considering the late date of the authority for the Scandinavian traditions, we cannot be sure that the latter may not owe some of their material to English minstrels. There are similar alternative possibilities with regard to the explanation of the striking resemblances which certain incidents of the adventures with Grendel and the dragon bear to incidents in the narratives of Saxo and the Icelandicsagas.

Date and Origin.—It is now time to speak of the probable date and origin of the poem. The conjecture that most naturally presents itself to those who have made no special study of the question, is that an English epic treating of the deeds of a Scandinavian hero on Scandinavian ground must have been composed in the days of Norse or Danish dominion in England. This, however, is impossible. The forms under which Scandinavian names appear in the poem show clearly that these names must have entered English tradition not later than the beginning of the 7th century. It does not indeed follow that the extant poem is of so early a date; but its syntax is remarkably archaic in comparison with that of the Old English poetry of the 8th century. The hypothesis that Beowulf is in whole or in part a translation from a Scandinavian original, although still maintained by some scholars, introduces more difficulties than it solves, and must be dismissed as untenable. The limits of this article do not permit us to state and criticize the many elaborate theories that have been proposed respecting the origin of the poem. All that can be done is to set forth the view that appears to us to be most free from objection. It may be premised that although the existing MS. is written in the West-Saxon dialect, the phenomena of the language indicate transcription from an Anglian (i.e. a Northumbrian or Mercian) original; and this conclusion is supported by the fact that while the poem contains one important episode relating to the Angles, the name of the Saxons does not occur in it at all.

In its original form, Beowulf was a product of the time when poetry was composed not to be read, but to be recited in the halls of kings and nobles. Of course an entire epic could not be recited on a single occasion; nor can we suppose that it would be thought out from beginning to end before any part of it was presented to an audience. A singer who had pleased his hearers with a tale of adventure would be called on to tell them of earlier or later events in the career of the hero; and so the story would grow, until it included all that the poet knew from tradition, or could invent in harmony with it. That Beowulf is concerned with the deeds of a foreign hero is less surprising than it seems at first sight. The minstrel of early Germanic times was required to be learned not only in the traditions of his own people, but also in those of the other peoples with whom they felt their kinship. He had a double task to perform. It was not enough that his songs should give pleasure; his patrons demanded that he should recount faithfully the history and genealogy both of their own line and of those other royal houses which shared with them the same divine ancestry, and who might be connected with them by ties of marriage or warfare. Alliance. Probably the singer was always himself an origin poet; he might, if he chose, freely reproduce the songs that he had learned, but he was doubtless free to improve or expand them as he chose, provided that his inventions did not conflict with what was supposed to be historic truth. For all we know, the intercourse of the Angles with Scandinavia, which enabled their poets to obtain new knowledge of the legends of Danes, Gautar and Swedes, may not have ceased until their conversion to Christianity in the 7th century. And even after this event, whatever may have been the attitude of churchmen towards the old heathen poetry, the kings and warriors would be slow to lose their interest in the heroic tales that had delighted their ancestors. It is probable that down to the end of the 7th century, if not still later, the court poets of Northumbria and Mercia continued to celebrate the deeds of Beowulf and of many another hero of ancient days.

Although the heathen Angles had their own runic alphabet, it is unlikely that any poetry was written down until a generation had grown up trained in the use of the Latin letters learned from Christian missionaries. Professor dates the first certain date at which some book-learned man, interested in the preservation of lore from the lips of a minstrel one of the stories that he had been accustomed to sing. It may have been before 700; much later it can hardly have been, for the old heathen poetry, though its existence might be threatened by the influence of the church, was still in vigorous life. The epic of Beowulf was not the only one that was reduced to writing: a fragment of the song about Finn, king of the Frisians, still survives, and possibly several other heroic poems were written down about the same time. As originally dictated, Beowulf probably contained the story outlined at the beginning of this article, with the addition of one or two of the episodes relating to the hero himself—anthem among them the legend of the swimmug-match. This story had doubtless been told at greater length in verse, but its insertion in its present place is the work of a poet, not of a mere redactor. The other episodes were introduced by some later writer, who had heard recited, or perhaps had read, a multitude of the old heathen tales, and the substance of which he piously sought to preserve from oblivion by weaving it in an abridged form, into the texture of the one great poem which he was transcribing. The Christian passages, which are poetically of no value, are evidently of literary origin, and may be of any date down to that of the extant MS. The curious passage which says that the subjects of Hrothgar sought deliverance from Grendel in prayer at the temple of the Devil, “because they knew not the true God,” must surely have been substituted for a passage referring sympathetically to the worship of the ancient gods.

An interesting light on the history of the written text seems to be afforded by the phenomena of the existing MS. The poem is divided into numbered sections, the length of which was probably determined by the size of the pieces of parchment of
which an earlier exemplar consisted. Now the first fifty-two lines, which are concerned with Scyld and his son Beowulf, stand outside this numbering. It may reasonably be inferred that there once existed a written text of the poem that did not include these lines. Their substance, however, is clearly ancient. Many difficulties will be obviated if we may suppose that this passage is the beginning of a different poem, the heroic of which was not Beowulf the son of Ecgtheow, but his Danish namesake. It is true that Beowulf the Scylding is mentioned at the beginning of the first numbered section; but probably the opening lines of this section have undergone alteration in order to bring them into connexion with the prefixed matter.

BIBLIOGRAPHY.—The volume containing the Beowulf MS. (then as the Cottonian Liber de Rerum Naturis, Cottonian Librarian. "Vitellius A. xiv".) was first described by Humphrey Wanley in 1705, in his catalogue of MSS., published as vol. iii. of H. G. Hickes's Thesaurus Veterum Linguarum Septentrionalium. In 1786 G. J. Thorcklin, an Icelandic draughtsman ("Vitellius A. xiv".); and, according to his theory of the draughtsman's work, Beowulf in its present form, was formed of numerous plans, which were preserved in the Royal Library at Copenhagen, and where it has, subsequently become in places less legible. Thorcklin's edition (1815) is of merely historic interest. The first edition showing competent knowledge of the original was that of C. Grein (1833), and still holds the record. Since then editions have been very numerous. The text of the poem was edited by C. W. M. Grein in his Bibliothek der angelsächsischen Poesie (1857), and again separately in 1867. Autotypes of the same MS. were published at Wiesbaden in 1890 by the Royal Academy of Sciences and the University. The first English Text Society in 1882. The new edition of Grein's Bibliothek, by R. P. Wülker, vol. i. (1883), contains a revised text with critical notes. The most serviceable separate editions are those of M. Heyne (1849-65, vol. iii. 1867); A. Berain (1891, 1896); and W. M. W. Cottard (1909, with English notes and glossary, 1898), and F. Holthausen (vol. i., 1905).

Eleven English translations of the poem have been published (see C. B. Tinker, The Translations of Beowulf, 1903). Among these may be mentioned those of J. M. Garnett (1814), a literal rendering in a metre imitating that of the original; J. Earl (1802) in prose; W. Morris (1895) in imitative metre, and almost unintelligibly archaistic in diction; and C. B. Tinker (1902) in prose.

In the bibliography of the earlier literature, at the end of the work, Beowulf, Untersuchungen über das angelsächsische Epos, 1888. Much valuable matter may be found in B. ten Brink, Beowulf, Untersuchungen (1888). The work of G. Saarzin, Beowulf-Studien (1888), which advocates the strange theory that Beowulf is a translation by Cynwulf of a poem by the Danish singer Starkadr, contains, amid much that is facetious, not a little that deserves careful consideration. The many articles by E. Grein in the Archiv für die Geschichte der Sprache and Literatur and other periodicals, are of the utmost importance for the textual criticism and interpretation of the poem. (H. Br.)

BEQUEST (from O. Eng. becwethan, to declare or express in words; cf. "quoth"), the disposition of property by will. Strictly, "bequest" is used of personal, and "devise" of real property. (See LEGACY; WILL OR TESTAMENT.)

BÉRAIN, JEAN (1638-1711), known as "the Elder," Belgian draughtsman and designer, painter and engraver of ornament, was born in 1638 or 1639 at Saint Mihiel (Meuse) and died in Paris on the 24th of January 1711. In 1654 he was appointed dessinateur de la chaîne du cabinet de roi, in succession to Gissey, whose pupil he is believed to have been. From 1677 onward he had apartments, near to those of André Charles Boullé (q.v.), for whom he made many designs, in the Louvre, where he died. After the death of Le Brun he was commissioned to compose and supervise the whole of the exterior decoration of the king's ships. Without possessing great originality he was inventive and industrious, and knew so well how to assimilate the work of those who had preceded him (especially Raffaelli's arabesques) and to adapt it to the taste of the time that his designs became the rage. He furnished designs for the decorations and costumes used in the opera performances, for court festivals, and for public solemnities such as funeral processions, and inspired the ornamentations of rooms and of furniture to such an extent that a French writer says that nothing was done during his later years which he had not designed, or at least which was not in his manner. He was, in fact, the oracle of taste and the supreme pontiff whose fiat was law in all matters of decora-

tion. His numerous designs were for the most part engraved under his own superintendence, and a collection of them was published in Paris in 1711 by his son-in-law, Thuret, clockmaker to the king. There are three books, Oeuvre de Jean Bérain, Ornaments inventés par J. Bérain et Dessins de J. Bérain contenant des ornements d'architecture. His earliest known work shows him as engraver—twelve plates in the collection of Diverses pièces de serrurerie inventées par Hughes Brisville et gravées par Jean Bérain (Paris, 1663), and in 1667 ten plates of designs for the use of gunsmiths. M. Guilmard in Les Motifs ornementalis, gives a complete list of his published works.

His son JEAN BÉRAIN, "the Younger" (1678-1726), was born in Paris, where he also died. He was his father's pupil, and exercised the same official functions after his death. Thus he planned the funeral ceremonies at St Denis on the death of the dauphin, and afterwards made the designs for the obsequies of Louis XIV. He is perhaps best known as an engraver. He engraved eleven plates of the collection Ornaments de peinture et de sculpture qui sont dans la galerie d'Apollon au château du Louvre, et dans le grand appartement du roi au palais des Tuileries (Paris, 1710), which have been wrongly attributed to his father, the Mauseo del duce di Bourgogne, and that of Marie-Louise Gabrielle de Savoie, reine d'Espagne (1714), &c. His work is exceedingly difficult to distinguish from his father's, the similarity of style being remarkable.

CLAUDE BÉRAIN, brother of the elder Jean, was still living in 1726. He was engraver to the king, and executed a good number of plates of ornament and arabesque of various kinds, some of which are included in his more distinguished brother's works. (J. P.-B.)

BÉRANGER, PIERRE JÉRÔME DE (1780-1857), French song-writer, was born in Paris on the 19th of August 1780. The aristocratic de was a piece of groundless vanity on the part of his father, who had assumed the name of Béranger de Mersis. He was descended in truth from a country innkeeper on the one side, and, on the other, from a tailor in the rue Montorgueil. Of education, in the narrower sense, he had but little. From the roof of his first school he beheld the capture of the Bastille, and this stirring memory was all that he acquired. Later on he passed some time in a school at Péronne, founded by one Bellengise on the principles of Rousseau, where the boys were formed into clubs and regiments, and taught to play solemnly at politics and war. Béranger was president of the club, made speeches before such members of Convention as passed through Péronne, and drew up addresses to Tallien or Rобеспierre at Paris. In the meanwhile he learned neither Greek nor Latin—not even French, it would appear; for it was after he left school, from the printer Laisney, that he acquired the elements of grammar. His true education was of another sort. In his childhood, shy, sickly and skilful with his hands, as he sat at home alone to carve cherry stones, he was already forming for himself those habits of retirement and patient elaboration which influenced the whole tenor of his life and the character of all that he wrote. At Péronne he formed of his good aunt to be a stout republican; and from the despotic popery of his left-handed father, he would listen to the thunder of the guns before Valenciennes, and fortify himself in his passionate love of France and distaste for all things foreign. Although he could never read Horace save in a translation, he had been educated on Télémaque, Racine and the dramas of Voltaire, and taught, from a child, in the tradition of all that is highest and most correct in French.

After serving his aunt for some time in the capacity of waiter, and passing some time also in the printing-office of one Laisney, he was taken to Paris by his father. Here he saw much low speculation, and many low royalist intrigues. In 1802, in consequence of a distressing quarrel, he left his father and began life for himself in the garret of his ever memorable song. For two years he did literary hackwork, when he could get it, and wrote pastoral, epics and all manner of ambitious failures. At the end of that period (1804) he wrote to Lucien Bonaparte, enclosing some of these attempts. He was then in bad health, and in the last state of misery. His watch was pledged. His
wardrobe consisted of one pair of boots, one greatcoat, one pair of trousers with a hole in the knee, and “three bad shirts which a friend of his hand warded itself in endeavouring to mend.” The friendly hand was that of Judith Frère, with whom he had been already more or less acquainted since 1796, and who continued to be his faithful companion until her death, three months before his own, in 1857. She must not be confounded with the Lisette of the songs; the pieces addressed to her (La Bonne Vieille, Maudit printemps, &c.) are in a very different vein. Lucien Bonaparte interested himself in the young poet, transferred to him his own pension of 1000 francs from the Institute, and set him to work on a Death of Nero. Five years later, through the same patronage, although indirectly, Béranger became a clerk in the university at a salary of another thousand. Meanwhile he had written many songs for convivial occasions, and “to console himself under all misfortunes”; some, according to M. Boiteau, had been already published by his father, but he set no great store on them himself; and it was only in 1812, while watching by the sick-bed of a friend, that it occurred to him to write down the best he could remember. Next year he was taken into the Constituent Assembly and admitted as a song-writer before the government! Manuscripts copies of Les Coeurs, Le Sénateur, above all, of Le Roi d’Yvetot, a satire against Napoleon, whom he was to magnify so much in the sequel, passed from hand to hand with acclamation. It was thus that all his best works went abroad; one man sang them to another over all the land of France. He was the only poet of modern times who could altogether have dispensed with printing.

His first collection escaped censure. “We must pardon many things to the author of Le Roi d’Yvetot,” said Louis XVIII. The second (1821) was more daring. The apathy of the Liberal camp, he says, had convinced him of the need for some bugle call of awakening. This publication lost him his situation in the university, and subjected him to a trial, a fine of 500 francs and an imprisonment of three months. Imprisonment was a small affair for Béranger. At Sainte-Pélagie he occupied a room (it had just been ejected by Paul Louis Courier), warm, well furnished, and preferable in every way to his own poor lodging, where the water froze on winter nights. He adds, on the occasion of his second imprisonment, that he found a certain charm in this quiet, claustral existence, with its regular hours and long evenings alone over the fire. This second imprisonment of nine months, together with a fine and expenses amounting to 1100 francs, followed on the appearance of his fourth collection. The government proposed through Lafayette that, if he would submit to judgment without appearing or making defences, he should only be condemned in the smallest penalty. But his public spirit made him refuse the proposal; and he would not even ask permission to pass his term of imprisonment in a Maison de santé, although his health was more than usually feeble at the time.

“When you have taken your stand in a contest with government, it seems to me,” he wrote, “ridiculous to complain of the blows it inflicts on you, and impolitic to furnish it with any occasion of generosity.” His first thought in La Force was to alleviate the condition of the other prisoners.

In the revolution of July he took no very considerable part. Copies of his song, Le Vieux Dragon, were served out to the insurgent crowd. He had been for long the intimate friend and adviser of the leading men; and during the decisive week his counsels went a good way towards shaping the ultimate result.

“As for the republic, that dream of my whole life,” he wrote in 1831, “I did not wish it should be given to us a second time unripe.” Louis Philippe, hearing how much the song-writer had done towards his elevation, expressed a wish to see and speak with him; but Béranger refused to present himself at court, and used his favour only to ask a place for a friend, and a pension for Rouget de L'Isle, author of the famous Marseillaise, who was now old and poor, and whom he had been already succouring for five years.

In 1848, in spite of every possible expression of his reluctance, he was elected to the Constituent Assembly, and that by so large a number of votes (204,471) that he felt himself obliged to accept the seat. Not long afterwards, and with great difficulty, he obtained leave to resign. This was the last public event of Béranger's life. He continued to polish his songs in retirement, visited by nearly all the famous men of France. He numbered among his friends Chateaubriand, Thiers, Jacques Lafitte, Michelet, Lamennais, Mignet. Nothing could exceed the amiability of his private character; so poor a man has rarely been so rich in good actions; he was always ready to receive help from his friends when he was in need, and always forward to help others. His correspondence is full of wisdom and kindness, with a smack of Montaigne, and now and then a vein of pleasantry that will remind the English reader of Charles Lamb. He occupied some of his leisure in preparing his own memoirs, and a certain treatise on Social and Political Morality, intended for the people, a work he had much at heart, but judged at last to be beyond his strength. He died on the 16th July 1857. It was feared that his funeral would be the signal for some political disturbance; but the government took immediate measures, and all went quietly. The streets of Paris were lined with soldiers and full of townsmen, silent and uncovered. From then to the time of Béranger!

The songs of Béranger would scarcely be called songs in England. They are elaborated, written in a clear and sparkling style, full of wit and incision. It is not so much for any lyrical flow as for the happy turn of the phrase that they claim superiority. Whether the subject be gay or serious, light or passionate, the medium remains untroubled. The special merits of the songs are merits to be looked for rather in English prose than in English verse. He worked deliberately, never wrote more than fifteen songs a year and often less, and was so fastidious that he has not preserved a quarter of what he finished. “I am a good little bit of a poet,” he says himself, “clever in the craft, and a conscientious worker to whom old airs and a modest choice of subjects (le coq qui je suis confiné) have brought some success.” Nevertheless, he makes a figure of importance in literary history. When he first began to cultivate the chanson, this minor form lay under some contempt, and was restricted to slight subjects and a humorous guise of treatment. Gradually he filled these little chiselled toys of verbal perfection with ever more and more of sentiment. From a date comparatively early he had determined to sing for the people. It was for this reason that he fled, as far as possible, the houses of his influential friends and came back gladly to the garret and the street corner. Thus it was, also, that he came to acknowledge obligations to Emile Debraux, who had often stood between him and the masses as interpreter, and given him the key-note of the popular humour. Now, he had observed in the songs of sailors, and all who labour, a prevailing tone of sadness; and so, as he grew more masterful in this sort of expression, he sought more and more after what is deep, serious and constant in the thoughts of common men. The evolution was slow; and we can see in his own works examples of every stage, from that of witty indifference in fifty pieces of the first collection, to that of grave and even tragic feeling in Les Souvenirs du peuple ou Le Vieux Vagabond. And this innovation involved another, which was as a sort of prelude to the great romantic movement. For the chanson, as he says himself, opened up to him a path in which his genius could develop itself at ease; he escaped, by this literary postern, from strict academical requirements, and had at his disposal the whole dictionary, four-fifths of which, according to La Harpe, were forbidden to the use of more regular and pretentious poetry.

If he still kept some of the old vocabulary, some of the old imagery, he was yet accustomed to people to hear moving subjects treated in a manner more free and simple than heretofore; so that his was a sort of conservative reform, preceding the violent revolution of Victor Hugo and his army of uncompromising romantics. He seems himself to have had glimmerings of some such idea; but he withheld his full approval from the new movement on two grounds:—first, because the romantic school misused somewhat brutally the delicate organism of the French language; and second, as he wrote to Sainte-Beuve in 1832, because they adopted the motto of "Art for art," and
set no object of public usefulness before them as they wrote. For himself (and this is the third point of importance) he had a strong sense of political responsibility. Public interest took a far higher place in his estimation than any private passion or favour. He had little tolerance for those erotic poets who sing their own loves and not the common sorrows of mankind, “who forget,” to quote his own words, “forget beside their mistress those who labour before the Lord.” Hence it is that so many of his pieces are political, and so many, in the later times at least, inspired with a socialist spirit of indignation and revolt. It is by this socialism that he becomes truly modern and touches hands with Burns.

Béranger (1861); *Correspondance de Béranger*, edited by Paul Bois (4 vols., 1860); *Béranger et Lamenais*, by Napoleon Peyrat (1857); *Quarante-cinq lettres de Béranger publiées par Madame Louise Colet (almost worthless)* (1857); Béranger, *ses amis, ses ennemis et ses critiques*, by A. Arnould (2 vols., 1864); *J. Janin, Béranger et son temps (2 vols., 1866)*; *Sainte-Beuve’s legende napoleonique* (1897). A bibliography of Béranger’s works was published by Jules Brivos in 1876.

**BERARD—BERARD**

Nizam-ul-Mulk under Berar, to the Mahur was, their general “who enemis” of the Authorities. Of course, the death of Berar, Beranger, however, was bought by himself. After he bought the province of Akbar’s Berar, at least in 1626, or in the sixteenth century, the province was divided among the English and the Mogul empire. Berar’s son was so called for the purpose of formation of the province. Berar was an unhappy man, his son was also unhappy. He was killed by his own people. The province was divided in two separate governments, named after its capitals Gawil and Mahur. The Mahnuni dynasty was, however, already tottering to its fall; and in 1490 Imad-ul-Mulk, governor of Gawil, who had formerly held all Berar, proclaimed his independence and proceeded to annex Mahur to his new kingdom. Imad-ul-Mulk was by birth a Kanarese Hindu, but had been captured as a boy in one of the expeditions against Vijayanagar and reared as a Mussulman. He died in 1504 and his direct descendants held the sultanate of Berar until 1501, when Burhan Imad Shah was deposed by his minister Tufal Khan, who assumed the kingship. This gave a pretext for the intervention of Murtaza Nizam Shah of Ahmednagar, who in 1572 invaded Berar, imprisoned and put to death Tufal Khan, his son Shams-ul-Mulk, and the ex-king Burhan, and annexed Berar to his own dominions. In 1595 Sultan Murad, son of the emperor Akbar, besieged Ahmednagar, and thereby the formal cession of Berar to Akbar was completed.

Murad, the founder of the city of Shahpur, fixed his seat at Berar, and after his death in 1598, and the conquest of the Deccan by Akbar, the province was united with Ahmednagar and Khandesh under the emperor’s fifth son, Danial (d. 1605), as governor. After Akbar’s death (1605) Berar once more became independent under the Abyssinian Malik Ambar (d. 1626), but in the first year of Shah Jahan’s reign it was again brought under the sway of the Mogul empire. Towards the close of the 17th century the province began to be overrun by the Maharrattas, and in 1718 the Delhi government formally recognized their right to levy blackmail (chauth) on the unhappy population. In 1724 the Nizam-ul-Mulk Asaf Jah established the independent line of the nizams of Hyderabad, and thenceforth the latter claimed to be de jure sovereigns of Berar, with exception of certain districts (Mehkar, Umarkhed, &c.) ceded to the peshwa in 1760 and 1795. The claim was contested by the Bhonsla rajas, and for more than half a century the miserable country was ground between the upper and the nether millstone.

This condition of things was ended by Wellesley’s victories at Assaye and Argaon (1803), which forced the Bhonsla raja to cede his territories west of the Wardha, Gawilgarh and Narnala. By the partition treaty of Hyderabad (1804) these ceded territories in Berar were transferred to the nizam, together with some tracts about Sindkhed and Jalna which had been held by Sindhia. By a treaty of 1822, which extinguished the Maharratta right to levy chauth, the Wardha river was fixed as the eastern boundary of Berar, the Melghat and adjoining districts in the plains being assigned to the nizam in exchange for the districts cast of the Wardha held by the peshwa.

Though Berar was no longer oppressed by its Maharratta taskmasters nor harried by Pindari and Bihil raiders, it remained long a prey to the turbulent elements let loose by the sudden cessation of the wars. From time to time bands of soldiers, whom the government was powerless to control, scoured the country, and rebellion succeeded rebellion till 1859, when the last fight against open rebels took place at Chichamola near Risod. Meanwhile the misery of the country increased with the reckless raising of loans by the nizam’s government and the pledging of the revenues to a succession of great farmers-general. At last the British government had to intervene effectively, and in 1853 a new treaty was signed with the nizam, under which the Hyderabad contingent was to be maintained by the British government, while for the pay of this force and in satisfaction of other claims, certain districts were “assigned” to the East India Company. It is these “Hyderabad Assigned Districts” which were popularly supposed to form the province of Berar, though they coincided in extent neither with the Berar of the nizams nor with the old Mogul province. In 1860, by a new treaty which modified in the nizam’s favour that of 1853, it was agreed that Berar should be held in trust by the British government for the purposes specified in the treaty of 1853.

Under British control Berar rapidly recovered its prosperity. Thousands of cultivators who had emigrated across the Wardha to the peshwa’s dominions, in order to escape the ruinous fiscal system of the nizam’s government, now returned; the American Civil War gave an immense stimulus to the cotton trade; the laying of a line of railway across the province provided yet further employment, and the people rapidly became prosperous and contented.

See *Imperial Gazetteer of India* (Oxford, 1908), and authorities there quoted.

**BÉRARD, JOSEPH FRÉDÉRIC** (1795–1828), French physician and philosopher, was born at Montpellier. Educated at the medical school of that town, he afterwards went to Paris, where he was employed in connexion with the *Dictionnaire des sciences médicales*. He returned in 1816, and published a work, *Doctrine médicale de l’école de Montpellier* (1819), which is indispensable to a proper understanding of the principles of the Vitalistic school. In 1823 he was called to a chair of medicine at Paris, which he held for three years; he was then nominated professor of hygiene at Montpellier. His health gave way under his labours, and he died in 1828. His most important book is his *Doctrines des rapports du physique et du moral* (Paris, 1825). He held that consciousness or internal perception reveals to us the existence of an immaterial, thinking, feeling, and willing subject, the self or soul. Alongside of this there is the vital force, the nutritive-power, which uses the physical frame as its organ. The soul and the principle of life are in constant reciprocal action, and the first owes to the second, not the formation of its faculties, but the conditions under which they are evolved. He showed himself unable to understand the points of view of those whom he criticized, and yet his own theories, midway between vitalism and animism, are entirely destitute of originality.

To the *Esprit des doctrines médicales de Montpellier*, published posthumously (Paris, 1830), the editor, H. Pétiot, prefixed an account of his life and works; see also Damiron, *Phil. en France au XIXe siècle* (Paris, 1834); C. J. Tisot, *Anthropologie générale* (1843).
BERAT—BERBERS

BERAT (Slav. Bygelgorod; Turk. Arnaut Belgrad), the capital of a sanjak in the vilayet of Issina, southern Albania, Turkey; on the river Ergene, Ergeni or Osun, a left-hand tributary of the Semeni. Pop. (1900) about 15,000. Berat is a fortified town, situated in a fertile valley, which produces wine, olive-oil, fruit and grain. It is the seat of an Orthodox metropolitan, and the inhabitants, of whom two-thirds are Albanian and the remainder principally Greek, are equally divided in religion between Christianity and Islam.

BERAUN (Czech Beraun), a town of Bohemia, Austria, 27 m. S.W. of Prague by rail. Pop. (1900) 6693, mostly Czech. It is situated at the confluence of the Beraun with the Litawa river, and is the seat of important textile industry, sugar-refining, corn-milling and brewing. Lime-kilns and the manufacture of cement, and smelting and iron works are carried on in the environs. Beraun is a place of immemorial antiquity. It was originally called na Brode (by the lord), and received the name of Bern, Berun or Verona in the 11th century, when it obtained the privileges of a city from the emperor Charles IV., who was specially attached to the place, calling it “Verona mea.” Under his patronage the town rapidly prospered. In 1421 Zizka restored the town, which later on was sacked and devastated by the troops of Duke Leopold, bishop of Passau. During the Thirty Years’ War it was sacked by the Imperialists, the Saxons and the Swedes in turn; and in the first Silesian war the same fate befell it at the hands of the French and Bavarians.

BERBER, a town and mudiria (province) of the Anglo-Egyptian Sudan. The town is on the right bank of the Nile, 1140 ft. above sea-level, in 18° 1’ N., 35° 59’ E., and 214 m. by rail N.W. of Khartum. Pop. about 6000. Berber derived its importance from being the starting-point of the caravan route, 242 m. long, across the Nubian desert to the Red Sea at Sackin, a distance covered in seven to twelve days. It was also one of the principal stopping-places between Cairo and Khartum. The caravan route to the Red Sea was superseded in 1906 by a railway, which leaves the Wadi Halfa-Khartum line at the mouth of the Atbara. Berber thus lost the Red Sea trade. It remains the centre and market-place for the produce of the Nile valley for a considerable distance. East of the town is an immense plain, which, if irrigated, would yield abundant crops.

Berber, or El Mekefri, is a town of considerable antiquity. Before its conquest by the Egyptians in 1820 its ruler owed allegiance to the kings of Senar. It was captured by the Mahdists on the 26th of May 1884, and was re-occupied by the Anglo-Egyptian army on the 6th of September 1897. It was the capital of the mudiria until 1905, in which year the headquarters of the province were transferred to Ed Damer, a town near the confluence of the Nile and Atbara. At the northern end of the mudiria is Abu Hamed (g.s.), important as a railway junction for Dongola mudiria. The best-known of the tribes inhabiting the province are the Hassania, Jaalim, Bisharin and Kimalam. During the Mahdi most of these tribes suffered severely at the hands of the derwish. In 1904 the total population of the province was estimated at 85,000. It has since considerably increased. The riverain population is largely engaged in agriculture, the chief crops cultivated being durra, barley, wheat and cotton.

BERBERA, chief town and principal port of the British Somaliland protectorate, North-East Africa, 155 m. S. of Aden, in 10° 26’ N., 45° 4’ E. Berbera stands at the head of a deep inlet which forms the only completely sheltered haven on the south side of the Gulf of Aden. It is the residence of the commissioner of the protectorate and the headquarters of the Somaliland battalions of the King’s African Rifles. The harbour is eleven to thirteen fathoms deep at the entrance (indicated by a lighthouse), decreasing to five fathoms near the shore. Occasional steamers find ample accommodation. There are two piers and numerous warehouses. The town is built in two divisions—the native town to the east, the new town, laid out by the Egyptians (1875–1877), to the west. The majority of the better-class houses are of rubble, one-storied and flat-roofed. The public buildings include the fort, hospital and barracks.

There are a Roman Catholic mission-house and convent and a government school. The affairs of the town are administered by a municipal council. The water-supply is brought to the town by an aqueduct from the hills some 8 m. distant. The bulk of the inhabitants are Somali, who have abandoned a nomadic life and adopted largely the ways of the Arab and Indian traders. The permanent population is under 10,000; but from October to April the population rises to 30,000 or more by the arrival of caravans from Ogaden and Dolbahante. The traders bring with them tens on the backs of camels and these are pitched near the native town. Their merchandise consists of sheep and goats, gum and resin, skins and ostrich feathers. The trade is almost entirely with Aden, of which Berbera may be considered a commercial dependency. The value of the goods brought in yearly by caravan exceeds on the average £50,000. The total trade of the port for the five years 1901–1905 averaged over £200,000 a year. The chief articles of import are cotton goods (European white longcloth and American grey shirting), rice and jowari, flour, dates, sugar and tobacco (the last from Rotterdam). Berbera is said to have been founded by the Ptolemies among the Barbori of the adjacent coast lands. It has been frequently into the possession of Arabs and was included in the Mahommedan conquests. At the time of the visit to the town of R. F. Burton and J. H. Speke (1856) it was occupied by its own sheikhs. In 1870 it was claimed by the khedive Ismail, but was not permanently occupied by Egypt until 1875. In 1884 it passed into the possession of Great Britain (see SOMALILAND, § 2, History).

BERBERINE, C₁₆H₁₈N₂O₂, an alkaloid occurring together with the alkaloids oxyacanthine C₁₆H₂₁N₂O₆, berberine C₁₅H₂₁N₂O₅, hydralatine C₁₆H₂₁N₂O₅, and canadine C₁₆H₂₃N₂O₄ in Berberis vulgaris; it also occurs in other plants, Berberis aristata, B. aquifolium, Hydrastis canadensis, &c. It is a yellow, crystalline solid, insoluble in ether and chloroform, soluble in 4 parts of water at 21°, and moderately soluble in alcohol. It is a monacid base; the hydrochloride, C₁₆H₁₈N₂O₂.HCl, is insoluble in cold alcohol, ether and chloroform, and soluble in 500 parts of water; the acid sulphate, C₁₆H₁₈N₂O₃.H₂SO₄, dissolves in about 100 parts of water. Canadine is a tetrahydroberberine.

Its constitution was worked out by W. H. Perkin (J.C.S., 1885, 55, p. 63; 1895, 57, p. 991). This followed from a study of the reactions of the base, showing that it is the product of a hemipinic acid (CH₃CO).C₆H₄.COONa, and a substance which proved to be ω-amino-ethyl-piperonyl carboxylic acid, CH₂O.C₆H₄.COONa.H₂O. Its formula was modified by Gadamer (Abs. J.C.S., 1902, i, p. 55), who made the free base an aldehyde, but the salts of an iso-quinolinium type. This formula, which necessitates the presence of two asymmetric carbon atoms in an alkyl tetrahydroberberine, has been accepted by M. Freund and F. Mayer (Abs. J.C.S., 1907, i, p. 632), who showed that two racemic propyl tetrahydroberberines are produced when propyl dihydroberberine is reduced.

BERBERS, the name under which are included all the branches of the indigenous “Libyan” race of North Africa. Since the dawn of history the Berbers have occupied the tract between the Mediterranean and the Sahara from Egypt to the Atlantic. The origin of the name is doubtful. Some believe it to be derived from the word Bābūbān (barbarians), employed first by the Greeks and later by the Romans. Others attribute the first use of the term to the Arab conquerors. However this may be, the tribes, that is, Barabara and Berbarea, appear in Egyptian inscriptions of 7000 and 1300 B.C., and the Berbers were probably intimately related with the Egyptians in very early times. Thus the true ethnic name may have become confused with Barbari, the designation naturally used by classical conquerors. To the Egyptians they were known as “Lebu,” “Mushusha,” “Tamahu,” “Tehenuu” and “Kahaka”; a long list of names is found in Herodotus, and the Romans called them Numidae, Gaetuli and Mauri, terms which have been derived respectively from the Greek νομίδαι (nomads), the name Gued’oula, of a great Berber tribe, and the Hebrew mahur (western). To speak of more modern times
there can be enumerated the Zouaoua and Jebelina (Tripoli and Tunisia); the Chaouia, Kabyles and Beni-Mzab (Algeria); the Shiloh (Chouaou; Amaqagh and Berbers (Morocco); the Tuareg, Amoushagh, Sorgu, &c. (Sahara). These tribes have many names, each with a distinctive name. Among the Azag, an important division of the Tuareg, one of the noble or free tribes, styled Aouragh, is said to descend from a tribe named Avirhga. The Avirhga, or Afrigha, in ancient times occupied the coast lands near Carthage, and some scholars derive the word Africa from their name (Africa, Roman). In regard to the ethnic relations of the Berbers there has been much dispute. The antiquity of their type is evidenced by the monuments of Egypt, where their ancestors are pictured with the same comparatively blond features which many of them still display. The aborigines of the Canary Islands, the Guanches, would seem almost certainly, from the remains of their language, to have been Berbers. But the problem of the actual origin of the Berber race has not yet been solved. Perhaps the most satisfactory theory is that of Sirs, who includes the Berbers in the "Mediterranean Race." General L. L. C. Faucher regards them as indigenous Libyans mingled with a fair-skinned people of European origin. Dr. Franz Peter-Berger, who, according to Prof. Flinders Petrie, are the most ancient of those people who are the closely related to the ancient Egyptians. Connection has been traced between the early Libyan race and the Cro-Magnon and other early European races and, later, the Basque peoples, Iberians, Picts, Celts and Gauls. The megalithic monuments of Italy and Celtic Europe have their counterpart in northern Africa, and it is suggested that these were all erected by the same race, by whatever name they be known, Berbers and Libyans in Africa, Iberians in Spain, Celts, Gauls and Picts in France and Britain.

In spite of a history of foreign conquest—Phoenician, Greek, Roman, Vandal, Arab and French—the Berber physical type and the Berber temperament and nationality have persisted since the stone age. The numerous invasions have naturally introduced a certain amount of foreign blood among the tribes fringing the Mediterranean, but those farther inland have preserved their racial purity to a surprising degree. Though considerable individual differences of type may be found in every village, the Berbers are distinctively a "race and a nation" who, in their language, costume, pass unchallenged as Europeans. Dark hair and brown or hazel eyes are the rule; blue-eyed blonds are found, but their frequency has been considerably overstated. The invaders who have most affected the Berber race are the Arabs, but the two races, with a common religion, often a common government, with the same tribal groupings, have failed to amalgamate to any great extent. This fact has been emphasized by Dr. R. G. Latham, who writes: "All that is not Arabic in the kingdom of Morocco, all that is not Arabic in the French provinces of Algeria, and all that is not Arabic in Tunis, Tripoli and Fezzan, is Berber." The explanation lies in a profound distinction of character. The Arab is a herdsman and a nomad; the Berber is an agriculturist and a townsman. The Arab has built his social structure on the Koran, which inculcates absolutism, aristocracy, theocracy; the Berber, despite his nominal Mahometanism, is a democrat, with his Jemda or "Witan-gemot" and his Konum or unwritten code, the Magna Carta of the individual's liberty as opposed to the community's good. The Konum forbids no sort of exercise of individual will, so long as it is not inimical to the right or rights of other individuals. The Arabizing of the Berbers is indeed limited to little beyond the conversion of the latter to Islam. The Arab, transported to a soil which does not always suit him, so far from thriving, tends to disappear, whereas the Berber becomes more and more aggressive, and yearly increases in numbers. At present he forms at least three-fifths of the population in Algeria, and in Morocco the proportion is greater. The difference between the Berber and the Arab of the Barbary States is summed up by Dr. Randall-MacIver in the following words:—"The Berber gives the impression of being, as he is, the descendant of men who have lived in sturdy independence, self-governing and self-reliant. The Arab is the degenerate offspring of a race which only from its history and past records can claim any title to respect. Cruel, venal, avaricious, dishonest, the Arab combines all the faults of a vicious nature with those which a degraded religion incites or encourages. The Berber, on the other hand, is straightforward, honest, by no means averse to money-making, but not unscrupulous in the methods which he employs to this end, intelligent in a degree to which the ordinary Arab never approaches, and trustworthy as no Arab can be."

The Berber's village is his state, and the government is vested in an assembly, the Jemda, formed of all males old enough to observe the fast of Ramadan. By them are determined all matters of peace or war, legislation, taxation and justice. The executive officer is the Amin, a kind of mayor, elected from some influential family in which the dignity is often in practice hereditary. He owes his position to the good-will of his fellows, receives no remuneration, and resigns as soon as he loses the confidence of the people. By him are appointed certain Tumman (sing. Tamen) who act as overseers, though without executive powers, in the various quarters of the village. They possess Berber, as has great a voice in affairs as the richest. The undated power of the Tumman is a vendetta and a sort of law, and by the formation of parties (sofs), within or without the assembly, for trade, political and other purposes. The Berbers are a warlike people who have never been completely subdued. Every boy as soon as he reaches sixteen is brought into the Jemda and given weapons which he carries till he is sixty. Though each village is absolutely independent as far as its internal affairs are concerned, two or more are often connected by administrative ties to form an Arsh or tribe. A number of these tribes form a Thakelt or confederacy, which is an extremely loose organization. An exception to this form of government is constituted by the Tuareg, whose organization, owing to their peculiar circumstances of life, is monarchical. Wars are declared by special messengers; the exchange of sticks or guns renders an amicable inviolable. In some tribes a tablet, on which is inscribed the name of every man fit to bear arms, is placed in the mosque. The Berbers, though Mahommedans, do not often observe the same avarice; they hasten the fast at Jemda; and eat wild boar's flesh and drink fig brandy. On the other hand, saints, both male and female, are paid more reverence by Berbers than by Arabs. Around their tombs their descendants settle, and thus sacred villages, often of considerable size, spring up. Almost every village, too, has its saint or prophet, and disputes as to their relative sanctity and powers cause fierce feuds. The hereditary caste known as Marabouts are frequently in open opposition to the absolute authority of the Jemda. They are possessed of certain privileges, such as exemption from the chief taxes and the duty of bearing arms. They, however, often take a foremost part in tribal administration, and are frequently called upon to perform the office of arbitrators in questions of disputed policy, &c. In the Jemda, too, the Marabout at times takes the place of honour and keeps order. The Berbers, if irreligious, are very superstitious, never leaving their homes without invoking evil spirits, and have a good and evil interpretation for every day of the week. Many Berbers still retain certain Christian and Jewish usages, relics of the pre-Islamic days in North Africa, but of their primitive religion there is no trace. They are seldom good scholars, but those under French rule take all the advantage they can of the schools instituted by the government. Their social tendencies are distinctly communistic; property is often owned by the family in common, and a man can call upon the services of his fellow villagers for certain purposes, as the building of a house. Provision for the poor is often made by the community.

The dress of the Berbers was formerly made of home-woven cloth, and the manufacture of woolen stuffs has always been one of the chief occupations of their women. The men wear a tunic reaching to the knees, the women a longer garment. For work the men use a leather apron, and in the cold
season and in travelling a burnous, usually a family heirloom, old
and ragged; the women, in winter, throw a coloured cloth over
their shoulders. The men's hair is cut short but their beards
are allowed to grow. In some districts there are peculiar cus-
toms, such as the wearing of small silver nose-rings, seen in
El-Jofra. The Berbers' weapons are those of the Arab: the long
straight sword, the slightly curved and highly ornamented
dagger, and the long gun. Berbers are not great town-builders.
Their villages, however, are often of substantial appearance:
with houses of untrimmed stones, occasionally with two storeys,
built on hills, and invariably defended by a bank, a stone wall
or a hedge. Sometimes their homes are mere huts of turf, or of
clay tiles, with mortar made from lime and clay or cow-dung.
The sloping roof is covered with reeds, straw or stones. The
living room is on the right, the cattle-stall on the left. The
dwellings are surrounded by a garden or small field of grain.
The second storey is not added till a son marries. In the villages
of the western Atlas the greater part of the upper storey consists
of a sort of rough verandah. In this mountain district the natives
spend the winter in vaults beneath the houses, and, for the sake
of warmth, the tenements are built very close. Agriculture,
which is carried on even in the mountain districts by means of
labour and constructed terraces, is antiquated in its methods.
The plough, often replaced on the steeper slopes by the hoe,
is similar to that depicted in ancient Egyptian drawings, and
hand irrigation is usual. A sickle, toothed like a saw, is used
for reaping. Corn is trodden by oxen, and kept in osier baskets
narrowing to the top, or clay granaries. The staple crop is
barley, but wheat, lentils, vetches, flax and gourds are also
cultivated. Tobacco, maize and potatoes have been introduced;
and the aloe and prickly pear, called in Morocco the Christian
tug, are also found. The Kabyles understand grafting, have
fine orchards and grow vines. The Beni-Abbas tribe in the
Algerian Atlas is famed for its walnuts, and many tribes keep
bees, chiefly for the commercial value of the wax. The Berber
diet largely consists of cucumbers, gourds, water-melons and
oranges, and a small artichoke (Cynara humilis) which grows
wild. At the beginning and end of their meal they drink a
strongly sweetened liquid made from green tea and mint. Tea-
drinking probably became a habit in Morocco about the begin-
ning of the 16th century; coffee came later, and gypsies at
feasts the food is served on large earthenware dishes with high
basket-work covers, like bee-skeps but twice as high.

The Berbers have many industries. They mine and work
iron, lead and copper. They have olive presses and flour mills,
and their own millstone quarries, even travelling into
Arab districts to build mills for the Arabs. They make
tiles, woodwork for the houses, domestic utensils and agricultural implements. They weave and dye
several kinds of cloth, tan and dress leather and manufacture
oil and soap. Without the assistance of the wheel the wheel
produce a variety of pottery utensils, often of very graceful
design, and decorated with patterns in red and black. Whole
tribes, such as the Beni-Sliman, are occupied in the iron trade;
the Beni-Abbas made firearms before the French conquest, and
on cannon are said to have been made by boring. Before it
was prescribed by the French, the manufacture of gunpowder
was general. The native jewellers make excellent ornaments
in silver, coral and enamel. In some places wood-carving has
been brought to considerable perfection; and natives artists
know how to engrave on metal both by etching and the burin.
In its collective industry the Berber race is far superior to the
Arab. The Berbers are keen traders too, and, after the harvest,
hawk small goods, travelling great distances.

A Berber woman has in many ways a better position than her
Arab sister. True, her birth is regarded as an event of no
moment, while that of a boy is celebrated by great
rejoicings, and his mother acquires the right to wear
on her forehead the tajfant, a mark which only the women
who have borne an heir can assume. Her husband buys and
can dismiss her at will. She has most of the hard work to do, and
is little better than a servant. When she is old and past work,
especially if she has not been the mother of a male child,
she is often abandoned. But she has a voice in public affairs;
she has laws to protect her, manages the household and goes
unveiled; she has a right to the money she earns; she can
inherit under wills, and bequeath property, though to avoid
the alienation of real property, succession to it is denied her.

But most characteristic of her social position is the Berber
woman's right to enter into a sacred bond or agreement,
represented by the giving of the anaya. This is some symbolic object,
stick or what not, which passes between the parties to a contract,
the obligations under which, if not fulfilled by the contracting
parties during their lives, become hereditory. Female saints,
too, are held in high honour; and the Berber pays his wife the
compliment of monogamy. The Kabyle women have stood side
by side with their husbands in battle. Among many Berber
tribes the law of inheritance is such that the eldest daughter's
son succeeds. South of Morocco proper, Gerhard Rohls, who
travelled extensively in the region (c. 1861-1867), states that a
Berber religious corporation, the Saizia Kartas, was ruled over
by a woman, the chief wife. The Berbers consult their women
in many matters, and only one woman is really held in low
esteem. She, curiously, is the kuwata or "go-between" since
though berbers are so often employed in the respectable task
of arranging marriages, Berber women are intelligent and
hard-working and, when young, very pretty and graceful.
The Berbers, unlike the Arabs, do not admire fat women.
Among the Kabyles the adulteress is put to death, as are those
women who have illegitimate children, the latter suffering with
their mothers.

Though Arabic has to a considerable extent displaced the
Berber language, the latter is still spoken by millions of people
from Egypt to the Atlantic and from the Mediterranean
to the Sudan. It is spoken nowhere else, though, as
has been said, place-names in the Canary Islands and other
remains of the aboriginal language there prove it to have been
the native tongue. Although the Berber tongue shows a certain
affinity with Semitic in the construction both of its words and
sentences Berber is quite distinct from the Semitic languages;
and a remarkable fact is that in spite of the enormous space
over which the dialects are spread and the thousands of years
that have elapsed since the Berber peoples have been separated
from the rest, these dialects show slight differences from the long-extinct
Hamitic speech from which all are derived. Whatever these
dialects be called, the Kabyle, the Shilha, the Zenati, the Tuareg
or Tamashke, the Berber language is still essentially one, and
the similarity between the forms current in Morocco, Algeria,
the Sahara and the far-distant oasis of Siwa is much more marked
than between the Norse and English in the sub-Aryan Teutonic
group. The Berbers have, moreover, a writing of their own,
peculiar and little used or known, the antiquity of which is
proved by monuments and inscriptions ranging over the whole
of North Africa.

The various spoken dialects, though apparently very unlike
each other, are not more dissimilar than are Portuguese, Spanish,
French and Italian, and their differences are doubtless attri-
butable to the lack of a literary standard. Even where different
words are used, there is evidence of a common stem from
which the various branches have sprung. The great difficulty of
satisfactory comparison arises from the fact that few of the
Berber dialects possess any writings. The Tawakkid (The Unity
of God), said to have been written in Moroccan Berber and be-
lieved to be the oldest African work in existence, except Egyptian
and Ethiopic, was the work of the Muwahhadi leader, Ibn
Tumurt the Mahdi, at a time when the officials of the Kairawan
mosque were dismissed because they could not speak Berber.
Most of the writings found, however, have been in the form
of inscriptions, chiefly on ornaments. A collection of the various
signs of the alphabet has shown thirty-two letters, four more
than Arabic. De Slane, in his notes on the Berber historian
Ibn Khalidun, shows the following points of similarity to the
Semitic class:- Its tri-literal roots, the inflections of the verb,
the formation of derived verbs, the genders of the second and
third persons, the pronominal affixes, the aorist style of tense, the whole and broken plurals and the construction of the phrase. Among the grammatical features of Berber may be mentioned two numbers (no dual), two genders and six cases, and verbs with one, two, three and four radicals, and imperative and aorist tense only. As might be expected the Berber tongue is most common in Morocco and the western Sahara—the regions where Arab domination was least exercised. When Arabic was mentioned as the language of Morocco it is seldom realized how small a proportion of its inhabitants use it as their mother tongue. Berber is the real language of Morocco, Arabic that of its creed and government.

BERCEUSE.—BERCHEM, or BERCHYM, NICOLAS (1620–1683), Dutch painter, was born at Haarlem. He received instruction from his father (Pieter Claesz van Haerlem) and from the painters Van Goyen, Jan Wils and Weenix. It is not known why he called himself Berchem or Berghem, and other variants. His pictures, of which he produced an immense number, were in great demand, as were also his etchings and drawings. His landscapes are highly esteemed; and many of them have been finely engraved by John Visscher. His finest pictures are at the Amsterdam Museum and at the Hermitage, St Petersburg.

BERCHTA (English Berths), a fairy in South German mythology. She was at first a benign spirit, the counterpart of Hulda in North German myth. Later her character changed and she came to be regarded as a witch. In Pagan times Bertha had the rank of a minor deity.

BERCHTSGADEN, a town of Germany, beautifully situated on the south-eastern confines of the kingdom of Bavaria, 1700 ft. above the sea on the southern declivity of the Uetschberg, 6 m. S.S.E. from Reichenhall by rail. Pop. (1905) 10,946. It is celebrated for its extensive mines of rock-salt, which were worked as early as 1174. The town contains three old churches, of which the early Gothic abbey church with its Romanesque cloister is most notable, and some good houses. Apart from the salt-mines, its industries include toys and other small articles of wood, horn and ivory, for which the place has long been famous. The district of Berchtesgaden was formerly an independent spiritual principality, founded in 1100 and secularized in 1803. The abbey is now a royal castle, and in the neighbour- hood a hunting-lodge was built by King Maximilian II. in 1582.

BEREK, a bathing resort of northern France, in the department of Pas-de-Calais, 25 m. S. of Boulogne by rail. Pop. (1906) 768. It comprises two parts—Berek-Ville, 13 m. on the shore, and Berek-Plage, the latter with a fine sandy beach. There are two children's hospitals, the climate proving peculiarly beneficial in the treatment of scrofulous affections. About 150 boats are employed in the fisheries, and herrings form the staple of an active trade. Boat-building and fish-curing are carried on.

BERDICHYEV, a town of W. Russia, in the government of Kiev, 116 m. S.W. of Kiev by rail and not far from the borders of Volhynia. The cathedral of the Assumption, finished in 1832, is the principal place of worship. The fortified Carmelite monastery, founded in 1627, was captured and plundered by Chmielnicki, chief of the Zaporogi Cossacks, in 1647, and disestablished in 1684. An extensive trade is carried on in peltry, silk goods, iron and wooden wares, salt fish, grain, cattle and horses. Four fairs are held yearly, the most important being on the 12th of June and the 15th of August. The numerous minor industries include the manufacture of tobacco, soap, candles, oil, bricks and leather. Pop. (1867) 52,563; (1897) 53,725; Jews forming about 80%. In the treaty of demarcation between the Lithuanians and the Poles in 1546 Berdichyev was assigned to the former. In 1768 Pulaski, leader of the confederacy of Bar, fled, after the capture of that city, to Berdichev, and there maintained himself during a siege of twenty-five days. The town belongs to the Radziwill family.

BERDYANSK, a seaport town of Russia, in the government of Taurida, on the north coast of the Sea of Azov, in 45° 45' N. lat. and 36° 40' E. long. The principal industries are in bricks and tiles, tallow and macaroni. The roads are protected from every wind except the south, which occasions a heavy surf; but against this a mole was constructed in 1863. The chief articles of export are cereals, flour, wool, hemp, skins and furs, and the imports include hardwares, fruits, oil and petroleum. In the immediate neighbourhood are salt-works.

BEREA, a town of Madison county, Kentucky, U.S.A., 131 m. by rail S. of Cincinnati. Pop. (1906) 762. Berea is served by the Louisville & Nashville railway. It is pleasantly situated on the border between the Blue Grass and the Mountain regions. The town is widely known as the seat of Berea College, which has done an important work among the mountainers of Kentucky and of Tennessee. The college has about 70 acres of ground (and about 4000 acres of mountain land for forestry study), with a large recitation hall, a library, a chapel (seating 1900 persons), a science hall, an industrial hall, a brick-making plant, a woodwork building, a printing building; a tabernacle for commencement exercises and other buildings. In 1908 Berea had 65 instructors and 1750 students; and it paid the tuition of 65 negro students in Fisk University (Nashville, Tennessee) and in other institutions. The school out of which Berea College has developed was founded in the anti-slavery interests in 1855. An attempt was made to procure for it a college charter in 1856, but the slavery interests caused it to be closed before the end of that year and it was not reopened until 1865, the charter having then been obtained, as Berea College. Negroes as well as whites were admitted until 1904, when education of the two races at the same institution was prohibited by an act of the state legislature (upheld by the U.S. Supreme Court in 1908). This act did not, however, prohibit an institution from maintaining separate schools for the two races, provided these schools were at least 25 m. apart, and a separate school for the negroes was at once projected by Berea.

BEREKHIAH NAQDAN, Jewish fabulist, author of a collection of fables, written in Hebrew. As his title implies (Naqdan = punctuator of the biblical text), Berakhiah was also a grammarians. He further wrote an ethical treatise and was the author of various translations. His date is disputed. Most authorities place him in the 13th century, but J. Jacobs has identified him with Benedicitus le Puncteur, an English Jew of the 12th century.
BERENGARIUS [BERENGAR] (d. 1088), medieval theologian, was born at Tours early in the 11th century; he was educated in the famous school of Fulbert of Chartres, but even in early life seems to have exhibited great independence of judgment. Appointed superintendent of the cathedral school of his native city, he taught with such success as to attract pupils from all parts of France, and powerfully contributed to diffuse an interest in the study of logic and metaphysics, and to introduce that dialectic development of theology which is designated the scholastic. The earliest of his writings of which we have any record is an Exhortatory Discourse to the hermits of his district, written at their own request and for their spiritual edification. It shows a clear discernment of the dangers of the ascetic life, and a deep insight into the significance of the Augustinian doctrine of grace. Sometime before 1040 Berengar was made archdeacon of Angers. It was shortly after this that rumours began to spread of his holding heretical views regarding the sacrament of the eucharist. He had submitted the doctrine of transubstantiation (already generally received both by priests and people, although in the west it had been first unequivocally taught and reduced to a regular theory by Paschalis Radbert in 851) to an independent examination, and had come to the conclusion that it was contrary to reason, unwarranted by Scripture, and inconsistent with the teaching of men like Augustine and Jerome. August 21 was the day he had conceived this conviction from his scholars and friends, and through them the report spread widely that he denied the common doctrine respecting the eucharist. His early friend and school companion, Adelmann, archdeacon of Liége, wrote to him letters of expositu on the subject of this report in 1046 and 1048; and a bishop, Hugo of Langres, wrote (about 1049) a refutation of the views which he had himself heard Berengar express in conversation. Berengar's belief was not shaken by their arguments and exhortations, and hearing that Lanfranc, the most celebrated theologian of that age, strongly approved the doctrine of Paschalis and condemned that of "Scotus" (really Ratramnus), he wrote to him a letter expressing his surprise and urging him to reconsider the question. The letter, arriving at Bec when Lanfranc was absent at Rome (1050), was sent after him, but was opened before it reached him, and Lanfranc, fearing the scandal, brought it under the notice of Pope Leo IX. Because of it Berengar was condemned as a heretic without being heard, by a synod at Rome and another at Vercellii, both held in 1050. His enemies in France cast him into prison; but the bishop of Angers, the archdeacon of Laon, and the archdeacon of Poitiers, who shared his conviction, and were in a considerable number, had sufficient influence to procure his release. At the council of Tours (1054) he found a protector in the papal legate, the famous Hildebrand, who, satisfied himself with the fact that Berengar did not deny the real presence of Christ in the sacramental elements, succeeded in persuading the assembly to be content with a general confession from him that the bread and wine, after consecration, were the body and blood of the Lord, without requiring him to define how. Trusting in Hildebrand's support, and in the justice of his own cause, he presented himself at the synod of Rome in 1059, but found himself surrounded by zealots, who forced him by the fear of death to signify his acceptance of the doctrine "that the bread and wine, after consecration, are not merely a sacrament, but the true body and the true blood of Christ, and that this body is touched and broken by the hands of the priest, and ground by the teeth of the faithful, not merely in a sacramental but in a real manner." He had no sooner done so than he bitterly repented his weakness; and acting, as he himself says, "on the principle that to take an oath which one never ought to have been taken is to estrange oneself from God," he resolved to retract what one has wrongfully sworn to, is to return back to God," when he got safe again into France he attacked the transubstantiation theory more vehemently than ever. He continued for about sixteen years to disseminate his views by writing and teaching, without being directly interfered with by either his civil or ecclesiastical superiors, greatly to the scandal of the multitude and of the zealots, in whose eyes Berengar was "ille apostolus Satane," and the academy of Tours the "Babylon nostris temporis." An attempt was made at the council of Poitiers in 1067 to allay the agitation caused by the controversy, but it failed, and Berengar narrowly escaped death in a tumult. Hildebrand, now pope as Gregory VII., next summoned him to Rome, and, in a synod held there in 1078, tried once more to induce him to yield to the demands of the multitude and its leaders; and in another synod at Rome (1079), finding that he was only endangering his own position and reputation, he turned unexpectedly upon Berengar and commanded him to confess that he had erred in not teaching a change as to substantial reality of the sacramental bread and wine into the body and blood of Christ. "Then," says Berengar, "confounded by the sudden madness of the pope, and because God in punishment for my sins did not give me a steadfast heart, I threw myself on the ground, and confessed with impious voice that I had erred, fearing the pope would instantly pronounce against me the sentence of condemnation, and, as a necessary consequence, that the populace would hurry me to the worst of deaths." He was kindly dismissed by the pope not long after, with a letter recommending him to the protection of the bishops of Tours and Angers, and another pronouncing anathema on all who should do him any injury or call him a heretic. He returned home overwhelmed with shame and bowed through life. He had been twice, and had a third time been guilty of great impiety. He immediately called for confession, and besought all Christian men "to pray for him, so that his tears might secure the pity of the Almighty." He now saw, however, that the spirit of the age was against him, and hopelessly given over to the belief of what he had combated as a delusion. He withdrew, therefore, into solitude, and passed the rest of his life in retirement and prayer on the island of St Côme near Tours. He died there in 1088.

Berengar left behind him a considerable number of followers. All those who in the middle ages denied the substantial presence of the body and blood of Christ in the eucharist were commonly designated Berengarians. They differed, of course, in many respects, even in regard to the nature of the supper. Berengar's own views on the subject may be thus summed up:—1. That bread and wine should become flesh and blood and yet not lose the properties of bread and wine was, he held, contradictory to reason, and therefore irreconcilable with the truthfulness of God. 2. He admitted a change (conversion) of the bread and wine into the body of Christ, in the sense that to those who receive them they should be considered as the body of Christ, but that the duration of this change should be such as to prevent the consubstantiation of bread and wine into the true, the intellectual or spiritual body of Christ. The unbelieving receive the external sign or sacrament; but the believing receive in addition, although invisibly, the reality represented by the sign, the res sacramenti. 3. He rejected the notion that the sacrament of the altar was a continually renewed sacrifice, and held it to be merely a commemoration of the once sacrifice of Christ. 4. He dwelt strongly on the importance of men looking away from the externals of the sacrament to the spirit of love and piety. The transubstantiation doctrine seemed to him full of evil, from its tendency to lead men to overvalue what was sensuous and transitory. 5. He rejected with indignation the miraculous stories told to confirm the doctrine of transubstantiation. 6. Reason and Scripture seemed to him the only grounds on which a true doctrine of the Lord's supper could be rested. He attached little importance to mere ecclesiastical tradition or authority, and none to the voice of majorities, even when sanctioned by the decree of a pope. In this, as in other respects, he was a precursor of Protestantism.

The opinions of Berengar are to be ascertained from the works written in refutation of them by Adelmann, Lanfranc, Guinmond, &c.; from the fragments of the Des sacr. coena adv. Lanfr. liber, edited by Staudlin (1829-1829); and from the Liber posterior, edited by A. F. and T. F. Vischer (1834). See the collection of texts by Sudendorf (1850); the Church Histories of Gieseler, i. 396-411 (Eng. trans.); and Neander, vii. 241-260 (Eng. trans.); A. Harnack's History of Dogma; Hauréau's Histoire de la philosophie scolastique, i. 225-238; Hermann Reuter, Geschichte der religiösen Aufklärung des
BÉRÉNGÈRE—BERÉNICE

BÉRÉNGÈRE, ALPHONSE MARIE MARCELLIN THOMAS (1875-1886), known as Bérénice de la Drôme, French lawyer and politician, son of a deputy of the third estate of Dauphiné to the Constituent Assembly, was born at Valence on the 31st of May 1785. He entered the magistracy and became *procureur général* at Grenoble, but resigned this office on the restoration of the Bourbons. He now devoted himself mainly to the study of criminal law, and in 1818 published *La Justice criminelle en France*, in which with great courage he attacked the special tribunals, provosts' courts or military commissions which were the main instruments of the Reaction, and advocated a return to the old common law and trial by jury. The book had a considerable effect in discrediting the reactionary policy of the government; but it was not until 1828, when Bérénice was elected to the chamber, that he had an opportunity of exercising a personal influence on affairs as a member of the group known as that of constitutional opposition. His courage, as well as his moderation, was again displayed during the revolution of 1830, when, as president of the parliamentary commission for the trial of the ministers of Charles X., he braved the fury of the mob and secured a sentence of imprisonment in place of the death penalty for which they clamoured.

His position in the chamber was now one of much influence, and he played a large part in the modellng of the new constitution, though his effort to secure a hereditary peerage failed. Above all he was instrumental in framing the new criminal code, based on more humanitarian principles, which was issued in 1835. It was due to him that, in 1832, the right, so important in actual French practice, was given to judges to find "extenuating circumstances" in cases when guilt involved the death penalty. In 1833 he had been made a member of the court of appeal (cour de cassation), and the same year was nominated a member of the academy of moral and political sciences. He was raised to the peerage in 1839. This dignity he lost owing to the revolution of 1848; and as a politician his career now ended. As a judge, however, his activity continued. He was president of the high courts of Bourges and Versailles in 1849. Having been appointed president of one of the chambers of the court of cassation, he devoted himself entirely to judicial work until his retirement, under the age limit, on the 31st of May 1860. He now withdrew to his native town, and occupied himself with his favourite work of reform of criminal law. In 1833 he had shared in the foundation of a society for the reclamation of young criminals, in which he continued to be actively interested to the end. In 1851 and 1852, on the commission of the academy of moral sciences, he had travelled in France and England for the purpose of examining and comparing the penal systems in the two countries. The result was published in 1855 under the title *La Répression pénale, comparaison du système pénitentiaire en France et en Angleterre*.

He died on the 15th of May 1866.

His son, RENÉ BÉRÉNÈRE (1830-1850), continued the work of his father, and at the outbreak of the revolution of 1870 was *majordome* of Lyon. He served as a volunteer in the Franco-German War, being wounded at Nuits on the 28th of December. Returned to the National Assembly by the department of Drôme, he was for a few days in 1873 minister of public works under Thiers. He then entered the senate, of which he was vice-president from 1894 to 1897. He founded in 1871 a society for the reclamation of discharged prisoners, and presided over various bodies formed to secure improvement of the public morals. He succeeded Charles Lucas in 1890 at the Academy of Moral and Political Science.

BERÉNICE, or BERENICE, the Macedonian queens of the Greek Phcenian, the name of (A) five Egyptian and (B) two Jewish princesses.

(A) 1. BERÉNICE, daughter of Lagus, wife of an obscure Macedonian soldier and subsequently of Ptolemy Soter, with whose bride Eurydice she came to Egypt as a lady-in-waiting. Her son, Ptolemy Philadephus, was recognized as heir over the heads of Eurydice's children. So great was her ability and her love that Pyrrhus of Epirus gave the name Berenices to a new city. Her son Philadephus decreed divine honours to her of her death. (See Theocritus, *Idylls* xv. and xvii.)

2. BERENICE, daughter of Ptolemy Philadephus, wife of Antiochus Theos of Syria, who, according to agreement with Ptolemy (249), had divorced his wife Laodice and transferred the succession to Berenice's children. On Ptolemy's death, Antiochus repudiated Berenice and took back Laodice, who, however, at once poisoned him and murdered Berenice and her son. The prophecy in Daniel xi. 6 seq. refers to these events.

3. BERENICE, the daughter of Magas, king of Cyrene, and the wife of Ptolemy III. Euergetes. During her husband's absence on an expedition to Syria, she dedicated her hair to Venus for his safe return, and placed it in the temple of the goddess at Zephyrium. The hair having by some unknown means disappeared, Conon of Samos, the mathematician and astronomer, explained the phenomenon in courtly phrase, by saying that it had been carried to the heavens and placed among the stars. The name *Coma Berenices*, applied to a constellation, commemorates this incident. Calimachus celebrated the transformation in a poem, of which only a few lines remain, but there is a fine translation of it by Catullus. Soon after her husband's death (221 B.C.) she was murdered at the instigation of her son Ptolemy IV., with whom she was probably associated in the government.

4. BERENICE, also called CLEOPATRA, daughter of Ptolemy X., married as her second husband Alexander II., grandson of Ptolemy VII. He murdered her three weeks afterwards.

5. BERENICE, daughter of Ptolemy Auletes, eldest sister of the great Cleopatra. The Alexandrines placed her on the throne in succession to her father (58 B.C.). She married Seleucus Nicator, but soon caused him to be slain, and married Archelaus, who had been made king of Comana in Pontus (or in Cappadocia) by Pompey. Auletes was restored and put both Berenice and Archelaus to death in 55 B.C.

(B) 1. BERENICE, daughter of Salome, sister of Herod I., and wife of her cousin Aristobulus, who was assassinated in 6 B.C. Their relations had been unhappy and she was accused of complicity in his murder. By Aristobulus she was the mother of Herod Agrippa I. Her second husband, Theodion, uncle on the mother's side of Antipater, son of Herod I., having been put to death for conspiring against Herod, she married Archelaus. Subsequently she went to Rome and enjoyed the favour of the imperial household.

2. BERENICE, daughter of Agrippa I., king of Judaea, and born probably about a.d. 28. She was married to Marcus, son of the alabarch Alexander of Alexandria. On his early death she was married to her father's brother, Herod of Chalcis, after whose death (a.d. 48) she lived for some years with her brother, Agrippa II. Her third husband was Polemon, king of Cilicia, but she soon deserted him, and returned to Agrippa, with whom she was living in 60 when Paul appeared before him at Caesarea (Acts xxvi.). During the devastation of Judaea by the Romans, she fascinated Titus, whom along with Agrippa she followed to Rome as his promised wife (a.d. 75). When he became emperor (a.d. 79) he dismissed her finally, though reluctantly, to her own country. Her influence had been exercised vainly on behalf of the Jews in a.d. 66, but the burning of her palace alienated her sympathies. For her influence see Juvenal, *Satires*, vi., and Tacitus, *Hist.* ii.

BERENICE, at Comana, on the coast of Epirus, in the west coast of the Red Sea, in 33° 65' N., 35° 34' E. Built at the head of a gulf, the *Sinus Immundus*, or Foul Bay, of Strabo, it was sheltered on the north by Ras Benas (Lepto Extremo). The port is now nearly filled up, has a sand-bar at its entrance and can be reached only by small craft. Most important of the ruins is a temple; the remnants of its sculptures and inscriptions preserve the name of Tiberius and the figures of many deities, including a goddess 1

1 Alabarch or Arabarch (Gr. ἀλαβάρχος, or άραβαρχος), the name of the head magistrate of the Jews in Alexandria under the Ptolemaic and Roman rulers.
BERESFORD, LORD CHARLES—BERESFORD, J.

of the emerald mines. Berenice was founded by Ptolemy II. (285-247 B.C.) in order to shorten the dangerous Red Sea voyage, and was named the disc of his mother. For four centuries it became the entrepôt of trade between India, Arabia and Upper Egypt. From it a road, provided with watering stations, leads north-west across the desert to the Nile at Coptos. In the neighbourhood of Berenice are the emerald mines of Zabara and Saket.

BERESFORD, LORD CHARLES WILLIAM DE LA PIER (1816- ), British admiral, second son of the 4th marquess of Waterford, was born in Ireland, and entered the "Britannia" as a naval cadet in 1839. He became lieutenant in 1868, and commander in 1875. In 1874 he was returned to parliament as Conservative M.P. for Waterford, retaining his seat till 1880, and he was already known in this period as a gallant officer, with a special interest in naval administration. In 1875-1876 he accompanied the then prince of Wales on his visit to India as naval A.D.C.; from 1878 to 1881 he was commander of the royal yacht "Osborne." He was in command of the gunboat "Condor" in the Mediterranean when the Egyptian crisis of 1882 occurred; and he became a popular hero in England in connexion with the bombardment of Alexandria (July 11), when he took his ship close in to the fortress and engaged them with such conspicuous gallantry that the admiral ordered a special signal "Well done, Condor!" He was promoted captain for his services, and, after taking an active part in the re-establishment of order in Alexandria, he served again in Egypt on Lord Wolseley's staff in the expedition of 1884-85, commanding the naval brigade at Abu Klea, Abu Kru and Metemmeh, and, with the river steamer "Safie," rescuing Sir C. Wilson and his party, who had been wrecked on returning from Khartum (Feb. 4, 1885). In November 1885 he was again returned to parliament as member for East Marylebone (re-elected 1886), and in Lord Salisbury's ministry of 1886 he was appointed a lord of the admiralty. The press agitation in favour of a stronger navy was now in full swing, and it was well known that in Lord Charles Beresford lie had an active supporter; but very little impression was made on the government, and in 1888 he resigned his office. On this question, a dramatic step which had considerable effect. In the House of Commons he advocated an expenditure of twenty millions sterling on the fleet, and the passing of the Naval Defence Act in 1889 was largely due to his action. At the end of 1889 he became captain of the cruiser "Undaunted" in the Mediterranean, and when this ship was paid off in 1893 he was appointed in command of the steam reserve at Chatham, a post he held for three years. In 1897 he became rear-admiral, and again entered parliament, winning a by-election at York; he retained his seat till 1900, but was mainly occupied during these years by a mission to China on behalf of the Associated Chambers of Commerce; he published his book The Break-up of China in 1899. In 1902 he was returned to parliament for Woolwich, but resigned on his appointment to command the Channel squadron (1903-1906); in 1905 he was given the command of the Mediterranean fleet, and from 1906 to 1909 was commander-in-chief of the Channel fleet; in 1906 he became a full admiral. At sea he had always shown a strong spirit of生气, and his influence over his men, and his reputation as one who would, if necessary, prove a great fighting commander was second to none; and, even when serving afloat and therefore unable to speak direct to the public, he was in the forefront of the campaign for increased naval efficiency. During the administration (1903-1910) of Sir John Fisher (see FISHER, BARON) as first lord of the admiralty it was notorious that considerable friction existed between them, and both in the navy and in public a great deal of party spirit was engendered in the discussion of their opposing views. When Lord Charles Beresford's term expired as commander-in-chief in March 1909 he was finally "unmuzzled," and the attack which for some years his supporters had made against Sir J. Fisher's administration came to a head at a moment coinciding with the new shipbuilding crisis occasioned by the revelations as to the increase of the German fleet. He himself came forward with proposals for a large increase in the navy and a reorganization of the administrative system, his first step being a demand for an inquiry, to which the government minister of his intention to discuss Beresford, a small committee under the prime minister. Its report (August), however, gave him no satisfaction, and he proceeded with his public campaign, bitterly attacking the ministerial policy. In January 1910, at the general election, he was returned as Conservative M.P. for Portsmouth; but meanwhile Sir John Fisher's term of office came to an end, and in his successor, Admiral Sir Arthur Knvyet Wilson (b. 1842), the navy obtained a first sea lord who commanded universal confidence.

BERESFORD, JOHN (1738-1805), Irish statesman, was a younger son of Sir Marcus Beresford, who, having married Catherine, sole heiress of James Power, 3rd earl of Tyrone, was created earl of Tyrone in 1746. After the death of the earl in 1763, Beresford's mother successfully asserted her claim suo jure to the barony of La Poer. John Beresford, born on the 4th of March 1738, thus inherited powerful family connections. He was educated at Trinity College, Dublin, was called to the Irish bar, and entered the Irish parliament as a member for Waterford in 1755. His industry, added to the influence of his family, procured his admission to the privy council in 1768, and his appointment as one of the commissioners of revenue two years later. In 1780 he became first commissioner of revenue, a position which gave him powerful influence in the Irish administration. He introduced some useful reforms in the machinery of taxation; and he was the author of many improvements in the architecture of the public buildings and streets of Dublin. He was first brought into conflict with Grattan and the popular party, in 1784, by his support of the proposal that the Irish parliament in return for the removal of restrictions on Irish trade should be bound to adopt the English navigation laws. In 1786 he was sworn a member of the English privy council, and the power which he wielded in Ireland through his numerous dependants and connexions grew to be so extensive that a few years later he was spoken of as the "king of Ireland." He was a vehement opponent of the increasing demand for relief of the Roman Catholics; and when it became known that Lord Fitzwilliam was to succeed Lord Westmterton as lord lieutenant in 1795 for the purpose of carrying out a conciliatory policy, Beresford expressed strong hostility to the appointment. One of Fitzwilliam's first acts was to dismiss Beresford from his employment but with permission to retain his entire official salary for life, and with the assurance that no other member of his family would be removed. Beresford immediately exerted all his influence with his friends in England, to whom he described himself as an injured and persecuted man; he appealed to Pitt, and went in person to London to lay his complaint before the English ministers. There is little doubt that the recall of Lord Fitzwilliam (g.v.), which was followed by such momentous consequences in the history of Ireland, was, as the viceroy himself believed, mainly due to Beresford's dismissal. There had been a misunderstanding on the point between Pitt and Fitzwilliam. The latter, whose veracity was unimpeachable, asserted that previous to his coming to Ireland he had informed the prime minister that the Irish ministry was in no position to take such a step; that Pitt had raised no objection. Pitt denied all recollection of any such communication, and on the contrary described the dismissal as "an open breach of the most solemn promise." In a letter to Lord Carlisle, justifying his action, Fitzwilliam mentioned that maliaverson had been imputed to Beresford. Beresford sent a challenge to Fitzwilliam, but the combatants were interrupted on the field and Fitzwilliam then made an apology.

When Lord Camden replaced Fitzwilliam in the viceroyalty in March 1795, Beresford resumed his former position. On the eve of the rebellion in 1798 his letters to Lord Auckland gave an alarming description of the condition of Ireland, and he counselled strong measures of repression. When first consulted by Pitt on the question of the union Beresford appears to have disliked the idea; but he soon became reconciled to the policy and warmly supported it. After the union Beresford continued to represent

1 Stanhope, Life of Pitt, ii. 301.
BERESFORD—BERG

Waterford in the imperial parliament, and he remained in office till 1802, taking an active part in settling the financial relations between Ireland and Great Britain. He died near Londonderry on the 25th of November 1805. John Beresford was twice married: in 1760 to a foreign lady, Constantia Ligondes, who died in 1772; and, secondly, in 1774 to Barbara Montgomery, a celebrated beauty who figures in Sir Joshua Reynolds's picture of "The Graces." He had large families by both marriages. His son, John Claudius, kept a riding school in Dublin, which acquired an evil reputation as the chief scene of the floggings by which evidence was extorted of the conspiracy which came to a head in 1798. He took a prominent part in the Irish House of Commons, where he unsuccessfully moved the reduction of the proposed Irish contribution to the imperial exchequer in the debates on the Act of Union, of which, unlike his father, he was to the last an ardent opponent.

BERESFORD, WILLIAM CARR BERESFORD, VISCOUNT (1768–1814), British general and Portuguese marshal, illegitimate son of the first marquess of Waterford, was born on the 2nd of October 1768. He entered the British army in 1785, and while in Nova Scotia with his regiment in the following year lost the sight of one eye by a shooting accident. He first distinguished himself at Toulon in 1793, receiving two years later the command of the 88th regiment (Connought Rangers). In 1799 his regiment was ordered to India, and a few months later Beresford left with Sir David Baird's expedition for Egypt, and was placed in command of the first brigade which led the march from Koseir across the desert. When, on the evacuation of Egypt in 1803, he returned home, his reputation was established. In 1805 he accompanied Sir David Baird to South Africa, and was present at the capture of Cape Town and the surrender of the colony. From South Africa he was despatched to South America. He had little difficulty in recruiting the Buenos Aires prisoners of war, and commanded two regiments. But his force was wholly insufficient to hold the colony. Under the leadership of a French émigré, the chevalier de Tiniers, the colonists attacked Beresford, and at the end of three days' hard fighting he was compelled to capitulate. After six months' imprisonment he escaped, and reached England in 1807, and at the end of that year he was sent to Madeira, occupying the island in the name of the king of Portugal. After six months in Madeira as governor and commander-in-chief, during which he learnt Portuguese and obtained an insight into the Portuguese character, he was ordered to join Sir Arthur Wellesley's army in Portugal. He was first employed as commandant in Lisbon, but accompanied Sir John Moore on the advance into Spain, and took a conspicuous part in the battle of Corunna (see Peninsular War). In February 1809 Beresford was given the task of reorganizing the Portuguese army. In this task, by systematic weeding-out of inefficient officers and men, he succeeded beyond the expectations of Wellington. By the summer of 1810 he had created a regular army of 10,000 men. The result was the moral and discipline of the force that Wellington brigaded some of the Portuguese regiments with English ones, and at Busaco Portuguese and English fought side by side. Beresford's services in this battle were rewarded by the British government with a knighthood of the Bath, and by the Portuguese with a peerage.

In the spring of 1811 Wellington was compelled to detach Beresford from the Portuguese service. The latter was next in seniority to General (Lord) Hill who had gone home on sick leave, and on him, therefore, the command of Hill's corps now devolved. Unfortunately Beresford never really gained the confidence of his new troops. At Campa Mayor his light cavalry brigade got out of hand, and a regiment of dragoons was practically annihilated. He invested Badajoz with insufficient forces, and on the advance of Soult he was compelled to raise the siege and offer battle at Albuera. His personal courage was even more than usually conspicuous, but to the initiative of a junior staff officer, Colonel (afterwards Viscount) Hardinge, rather than to Beresford's own generalship, was the hardly-won victory to be attributed. Beresford then went back to his work of reorganizing the Portuguese army. He was present at the siege of Badajoz and at the battle of Salamanca, where he was severely wounded (1812). In 1813 he was present at the battle of Vittoria, and at the battles of the Pyrenees, while at the battle of the Nivelle, the Nive and Orthez he commanded the British centre, and later he led a corps at the battle of Toulouse. At the close of the Peninsular War he was created Baron Beresford of Alberia and Cappoquin, with a pension of £2000 a year, to be continued to his two successors.

In 1810 the revolution in Portugal led to the dismissal of the British officers in the Portuguese service. Beresford therefore left Portugal and placed the question of the arrears of pay of his army before the king at Rio Janeiro. On his return the new Portuguese government refused to allow him to land, and he accordingly left for home. On arriving in England he turned his attention to politics, and strongly supported the duke of Wellington in the House of Lords. In 1829 his barony was made a life peerage, and when the duke of Wellington formed his first cabinet in 1828 he gave Beresford the office of master-general of the ordnance. In 1830 Beresford retired from politics, and for some time subsequently he was occupied in a heated controversy with William Napier, the historian of the Peninsular War, who had severely criticised his tactics at Albuera. On this subject Wellington's opinion of Beresford is to the point. The duke had no illusions as to his being a great general, but he thought very highly of his powers of organization, and he went so far as to declare, during the Peninsular War, that, in the event of his own death, he would on this ground recommend Beresford to succeed him. The last years of Beresford's life were spent at Bedgebury, Kent, where he had purchased a country estate. He died on the 8th of January 1854.

BEREZINA, a river of Russia, in the government of Minsk, forming a tributary of the Dnieper. It rises in the marshes of Borizov and flows south, inclining to east, for 356 m. (250 m. navigable), in the most part through low-lying but well-wooded country. As a navigable river, and forming a portion of the canal system which unites the Black Sea with the Baltic, it is of importance for commerce, but is subject to severe floods. It was just above Borizov that Napoleon's army forced the passage of the Berezina, with enormous losses, on the 26th–28th of November 1812, during the retreat from Moscow.

BEREZOV, a town of Asiatic Russia, in the government of Tobolsk, 700 m. N. of the city of that name, situated on three hills on the left bank of the Sosva, 26 m. above its mouth in the Ob, in 63° 55' N. lat. and 65° 7' E. long. It has more than once suffered from conflagrations—for example, in 1719 and 1808. Prince Menshikov, the favourite of Peter the Great and Catherine I., died here an exile, in 1729. In 1730 his enemy and rival, Prince Dolgorukii, was interned here with his family; and in 1742 General Ostermann was sent to Berezov with his wife and died there in 1747. The yearly mean temperature is 25° Fahr., and the maximum being 42°. It has a cathedral, near which lies buried Mary Menshikov, once betrothed to the tsar Peter II., and some of the Dolgorukis. There is some trade in furs, mammoth bones, dried and salted fish. Pop. (1807) 1073.

BEREZOVSK, a village of east Russia, in the government of Perm, on the eastern slope of the Urals, 8 m. N.E. of Ekaterinburg. It is the centre of an important gold-mining region (5 m. by 2) of the same name. The mines have been known since 1747. The inhabitants also manufacture boots, cut stone and carry on cabinet-making.

BERG (Ducatus Montensis), a former duchy of Germany, on the right bank of the Rhine, bounded N. by the duchy of Cleves, E. by the countship of Luarc and the duchy of Westphalia, and S. and W. by the bishopric of Cologne. Its area was about 1120 sq. m. The district was raised in 1108 to the rank of a countship, but did not become a duchy till 1380, after it had passed into the possession of the Jülich family. In 1423 the duchy of Jülich fell to Adolph of Berg, and in 1437 the countship
of Ravensberg was united to the duchies of Jülich-Berg-Ravensburg became extinct in 1511, and the duchy passed by marriage to John III. (d. 1539), duke of Cleves and count of La Mark, whose male line became extinct with the death of John William, bishop of Münster, in 1609.

Of the latter’s four sisters, the eldest (Marie Eleonore) was married to Albert Frederick, duke of Prussia, the second (Anna) to Philip Louis, count palatine of Neuburg, the third (Magdalena) to John, count palatine of Zweibrücken, and the fourth (Sybille) to Charles of Habsburg, margrave of Bavaria. The question of the succession led to a prolonged contest, which was one of the causes of the Thirty Years’ War. It was settled in 1614 by a partition, under which Berg, with Jülich, was assigned to the count palatine of Neuburg, in whose line it remained till 1742, when it passed to the Sultzbach branch of the house of Wittelsbach.

On the death of Charles Theodore, the last of this line, in 1790, Julich and Berg fell to Maximilian Joseph of Zweibrücken (Maximilian I. of Bavaria), who ceded the duchies in 1806 to Napoleon. Berg was bestowed by Napoleon, along with the duchy of Cleves and other possessions, on Joachim Murat, who bore the title of grand-duke of Berg; and after Murat’s elevation to the throne of Naples, it was transferred to Louis, the son of the king of Holland. By the congress of Vienna in 1815 it was made over to Prussia.

See B. Schönhölder, Geschichte des Bergischen Landes (Elberfeld, 1869); Stokvis, Manuel d’histoire, etc., vol. 3 (1893); and R. Göcke, Das Grossherzogtum Berg unter Joachim Murat, Napoleon 1st. und Louis Napoleon, 1806–1813 (Cologne, 1877).

BERGAMASK, or BERGOMASK (from the town of Bergamo in North Italy), a clumsy rustic dance (cf. Shakespeare, Midsummer Night’s Dream, v. 360) copied from the natives of Bergamo, reputed to be very awkward in their manners.

BERGAMO (anc. Bergomum), a city and episcopal see of Lombardy, Italy, capital of the province of Bergamo, situated at the foot of the Alps, at the junction of the Brembo and Serio, 333 m. N.E. of Milan by rail, and 26 m. direct. Pop. (1901) town, 25,425; commune, 46,861. The town consists of two distinct parts, the older Città Alta, upon a hill 1200 ft. above sea-level, strongly fortified by the Venetians, and the new town (Città Bassa) below, the two being connected by a funicular railway. The most interesting building of the former is the fine Romanesque church of S. Maria Maggiore, founded in 1137 and completed in 1355, with a baroque interior and some interesting works of art. Adjoining it to the north is the Cappella Colleoni, with a richly sculptured polychrome façade, and a modernized interior, containing the great tomb of Colleoni. From (c. 1690) is the Cappella of Bergamo, and his daughter Medea. The work was executed in 1470–1476 by Giovanni Antonio Amadeo, who was also employed at the Certosa di Pavia. The market-place (now Piazza Garibaldi) contains the Gothic Palazzo Vecchio or Broletto; close by are the cathedral (1614) and a small baptistery of 1340, rebuilt in 1898. The lower town contains an important picture-gallery, consisting of three collections of works of north Italian masters, one of which was bequeathed in 1891 by the art critic Giovanni Morelli. Bergamo has fine modern buildings and numerous silk and cotton factories. It also has a considerable cattle market, though its yearly Fiera di S. Alessandro (the patron saint) has lost some of its importance. Railways radiate from it to Lecco, Ponte della Selva, Usmate (for Monza or Seregno), Treviglio (on the main line from Milan to Verona and Venice) and (via Rovato) to Brescia, and steam tramways to Treviglio, Sarnico and Soncino.

The ancient Bergomum was the centre of the tribe of the Orobi; it became, after their subjection to Rome, a Roman municipality with a considerable territory, and after its destruction by Attila, became the capital of a Lombard duchy. From 1268 to 1423 it was under Milan, but then became Venetian, and remained so until 1797. Remains of the Roman city are not visible above ground, but various discoveries made are recorded by G. Mantovani in Not. Scon., 1890, 25.

BERGAMOT OIL, an essential oil obtained from the rind of the fruit of the Citrus bergamia. The bergamot is a small tree with leaves and flowers like the bitter orange, and a round fruit nearly 3 in. in diameter, having a thin lemon-yellow smooth rind. The tree is cultivated in southern Calabria, whence the entire supply of bergamot oil is drawn. Machinery is mostly used to express the oil from the fruit, which is gathered in November and December. The oil, which on standing deposits a stearamoptene, bergamot camphor or bergapten, is a limpid greenish-yellow fluid of a specific gravity of c. 882 to c. 886, and its powerful but pleasant odour is mainly due to the presence of linalyl acetate, or bergamol, which can be artificially prepared by heating linalol with acetic anhydride. The chief use of bergamot oil is in perfumery. The word apparently is derived from the Italian bergamo, a species of pear, for which the Roman Berga, calvaria ( prince’s pear; cf. Ger. Fürstenbirn).

BERGEDORF, a town of Germany, in the territory of Hamburg, on the river Bille, 10 m. by rail E. by S. from the city. Pop. (1900) 23,728. It produces vegetables and fruit for the Hamburg markets, and carries on tanning, glass manufacture, brewing and brick-making. It received civic rights in 1275, belonged to Lübeck and Hamburg conjointly from 1420 to 1868, and in the latter year was purchased by Hamburg. The surrounding district, exceptionally fertile marshland, is known as Die Vierlande, being divided into four parishes, whence the name is derived.

BERGEN, a city and seaport of Norway, forming the separate county (am), on the west coast, in lat. 60° 23’ N. (about that of the Shetland Islands). Pop. (1900) 72,179. It lies at the head of the broad Byfjord, and partly on a rocky promontory (Nordnaes) between the fine harbour (Vaagen) and the Pudderfjord. Its situation is very beautiful, the moist climate (mean annual rainfall, 74 in.) fostering on the steep surroundings hills a vegetation unusually luxuriant for the latitude. Behind the town lie the greater and lesser Lungegaard Lakes, so that the site is in effect a peninsula. The harbour is crowded with picturesque timber-ships and fishing-smacks, and bordered by quays. The principal street is Strandaebot, on the Nordnaes, parallel with the harbour, communicating inland with the tor or marketplace, which fronts the harbour and contains the fish and fruit market. The portion of the city on the mainland rises in an amphitheatre. The houses, of wood or stucco, are painted in warm reds and yellows. On the banks of the lesser Lungegaard Lake is the small town park, and above the greater lake the pleasant Nygards park, with an aquarium adjoining. Among the principal buildings are the cathedral (rebuilt in the 16th century), a museum, the imperial castle (the residence of the Marquis of Beren), a large market and a theatre. The observatory and botanical station are maintained.

The museums are of great interest. The Vestlandske fishery and industrial museum also contains a picture gallery, and exhibition of the Bergen Art Union (Kunstforening). The Bergen museum contains antiquities and a natural history collection. The Hanseatic museum is housed in a carefully-preserved gaard, or store-house and offices of the Hanseatic League of Hanseatic merchants, who inhabited the German quarter (Tydskenbryggen) and were established here in great strength from 1445 to 1558 (when the Norwegians began to find their presence irksome), and brought much prosperity to the city in that period. The Bergenhus and Fredrikberg forts defend the north and south entries of the harbour respectively. The first was originally built in the 13th century by King Haakon Hakonsson, and subsequently enlarged; and still bears marks of an English attack when a Dutch fleet was driven to shelter here in 1665. Near it are remains of another old fort, the Sverresborg. Electric trams ply in the principal streets.

Bergen is the birthplace of the poets Ludvig Holberg (1684–1754) and Johan Welhaven (1809–1873), of Johan Dahl the painter (1788–1857), of Ole Bull (1810–1882) and Edward Grieg the musicians. There are statues to Holberg and Bull, and also to Christie, president of the Storting (parliament) in 1818 and 1818.
BERGEN-OP-ZOOM—BERGK

BERGEN ranks first of the Norwegian ship-owning centres, having risen to this position from fifth in 1879. The trade, however, is exceeded by that of Christiania. The staple export trade is in fish and their products; other exports are butter, copper ore, and hides. The principal imports are coal, machinery, salt, grain and provisions. The manufactures are not extensive, but the preparation of fish products, shipbuilding, weaving and distillery, with manufactures of paper, pottery, tobacco and ropes are carried on. Bergen is an important centre of the extensive tourist traffic of Norway. Regular steamers serve the port from Hull and Newcastle (about 40 hours), from Hamburg, and from all the Norwegian coast towns. Many local steamers penetrate the fjords, touching at every village and gaard. Bergen is the nearest port to the famous Hardanger Fjord, and is the starting-point of a remarkable railway which runs through many tunnels and fine scenery towards Vossevangen or Voss. In 1856 a beginning was made with the continuation of this line through the mountains to connect with Christiania. In the first 30 m. from Voss the line ascends 4080 ft., passing through a tunnel 5796 yds. long.

Bergen (formerly Bjørgvin) was founded by King Olaf Kyrre in 1070-1075, and rapidly grew to importance, the Bay of Bergen becoming the scene of several important engagements in the civil wars of subsequent centuries. The Hanse merchants or trading guilds established their halls here until 1764, and the town suffered from fire, as in 1702 and 1855, and the broad open spaces (Almenningar) which interrupt the streets are intended as a safeguard against the spread of flames.

See Y. Nielsen, Bergen fra de ældste tiders indtil nutiden (Christiania, 1877); H. Jager, Bergen og Bergenserne (Bergen, 1889).

BERGEN-OP-ZOOM, a town in the province of North Brabant, Holland, situated on both sides of the small river Zoom, near its confluence with the East Scheldt, 383 m. by rail E. by N. of Flushing. It is connected by steam tramway with Antwerp (20 m. S.) and with the islands of Tholen and Duiveland to the north-west. Pop. (1900) 13,603. The houses are well built, the market-places and squares handsome and spacious. It possesses a port and an arsenal, and contains a fine town hall, with portraits of the ancient margraves of Bergen-op-Zoom, a Latin school, and an academy of design and architecture. The remains of the old castle of the margraves have been converted into barracks. The tower is still standing and is remarkable for its size as it rises, which causes it to rock in a strong wind. The church of St. John was raised to a college in 1605, and Sander Breker killed in a duel with Sir Edward Sackville, afterwards earl of Dorset, in 1613. There are numerous tile-works and potteries of fine ware; and a considerable trade is carried on in anchovies and oysters caught in the Scheldt. A large sugar-beet industry has also sprung up here in modern times.

Bergen-op-Zoom is a very old town, but little is known of its early history beyond the fact that it was taken by the Normans in 880. In the 13th century it became the seat of Count Gerhard of Wesemaal, who surrounded it with walls and built a castle. By the end of the 15th century it had become one of the most prosperous towns of Holland, on account of its fisheries and its cloth-trade. In 1576 the town joined the United Netherlands, and was shortly afterwards fortified. In 1588 it was successfully defended against the duke of Parma by an English and Dutch garrison commanded by Colonel Morgan, and in 1605 it was suddenly attacked by Du Tertul. In 1622 the Spaniards, under Spinola, made another attempt to take the town, but were forced to abandon the enterprise after a siege of ten weeks and the loss of 1200 men and 60 cannon. The extensive fortifications were greatly strengthened by Coehorn, and in 1725 they were further extended. In 1747, however, the town was taken by the French, under Marshal Léwendal, who surprised it by means of a subterranean passage. Restored at the end of the war, it was again taken by the French under Picheguer in 1795. The English, under Sir Thomas Graham, afterwards Lord Lynedoch, in March 1814 made an attempt to take it by a coup de main, but were driven back with great loss by the French, who surrendered the place, however, by the treaty of peace in the following May.

The lordship of Bergen-op-Zoom appears, after the definite union of the Low Countries with the Empire in 924, as an hereditary fief of the Empire, and the succession of its lords may be traced from Henry (1008-1129), who also held Breda. In 1533 it was raised to a margraviate by the emperor Charles V., and was held by various families until in 1790 it passed, through the Sultza branch of the Wittelsbachs, to the royal house of Bavaria, by whom it was renounced in favour of the Batavian republic in 1801.

BERGERAC, a town of south-western France, capital of an arrondissement in the department of Dordogne, on the right bank of the Dordogne, 60 m. E. of Bordeaux on the railway to Cahors. Pop. (1906) town, 10,545; commune, 15,623. The river is rendered navigable by a large dam and crossed by a fine bridge which leads to the suburb of La Madeleine. Apart from a few old houses in the older quarter by the river, the town contains no monuments of antiquarian interest. There is a handsome modern church built in the middle of the 17th century. Bergerac is the seat of a sub-prefect and has tribunals of first instance and of commerce and a communal college. Wine of fine quality is grown in the district, and is the chief source of the commerce of the town. It is mainly carried on with Léogane and Bordeaux. There is trade in grain, truffles, chestnuts, brandy and in the salmon of the Dordogne. The town has four-mills, iron-works, tanneries, distilleries and nursery-gardens, and it has manufactures of casks and of vinegar. There are quarries of millstone in the vicinity. In the 16th century Bergerac was a very flourishing and populous place, but most of its inhabitants having embraced Calvinism it suffered greatly during the religious wars and by the revocation of the edict of Nantes (1685). It was in 1577 the scene of the signing of the sixth peace between the Catholics and Protestants. Its fortifications and citadel were demolished by Louis XIII. in 1621.

BERGHAUS, HEINRICH (1797-1884), German geographer, was born at Kleve on the 3rd of May 1797. He was trained as a surveyor, and after volunteering for active service under General Tavenzien in 1813, joined the staff of the Prussian trigonometrical survey in 1816. He carried on a geographical school at Potsdam in company with Heinrich Lange, August Petermann, and others, and long held the professorship of applied mathematics at the Bauakademie. But he is most famous in connexion with the cartographic work. His greatest achievement was the Physikalischer Atlas (Gottha, 1838-1848), in which work, as in others, his nephew HERMANN BERGHAUS (1828-1896) was associated with him. He had also a share in the re-issue of the great Stieler Handatlas (originally produced by Adolf Stieler in 1817-1823), and in the production of other atlases. His written works were numerous and important, including Allgemeine Länder- und Volkerkunde (Stuttgart, 1807-1840), Grundriss der Geographie in fünf Bänden (Berlin, 1842), Die Völker des Erdballs (Leipzig, 1845-1847), Was man von der Erde weiss (Berlin, 1856-1860), and various large works on Germany. In 1863 he published Briefwechsel mit Alexander von Humbold (Leipzig). He died at Stettin on the 17th of February 1884.

BERGK, THEODOR (1812-1881), German philologist, was born at Leipzig on the 22nd of May 1812. After studying at the university of his native town, where he profited by the instruction of G. Hermann, he was appointed in 1835 to the lecturership in Latin at the orphan school at Halle. After holding posts at Neustrelitz, Berlin and Cassel, he succeeded (1842) K. F. Hermann as professor of classical literature at Marburg. In 1848 he was made professor of Greek literature and in 1855 he returned to Halle. In 1868 he resigned his professorship, and settled down to study and literary work in Bonn. He died on the 20th of July 1881, at Ragatz in Switzerland, where he had gone for the benefit of his health. Bergk's literary activity was very great, but his reputation mainly rests upon his work in connexion with Greek literature and the Greek lyric poets. His Poetae Lyrici Graeci (1843, 5th ed. 1900, &c.), and Griechische Litteraturgeschichte (1872-1887, completed by G. Hinrichs and R. Peppmüller) are standard.
BERGLER—BERI-BERI

works. He also edited Anacreon (1834), the fragments of Aristophanes (1840), Aristophanes (3rd ed., 1872), Sophocles (2nd ed., 1888), a lyric anthology (4th ed., 1890). Among his other works may be mentioned: Augustus Keram a se gestorum Index (1873); Inschriften römischer Schleudergeschosse (1875); Zur Geschichte und Topographie der Rheinlande in römischer Zeit (1882); Beiträge zur römischen Chronologie (1884).

His Philosophische Schriften have been edited by Peppermuller (1884-1886), and contain, in addition to a complete list of his writings, a sketch of his life. See Sands, Hist. of Class. Schol. lit. 146 (1908).

BERGLER, STEPHAN, German classical scholar, was born about 1680 at Kronstadt in Transylvania. The date of his death is uncertain. After studying at Leipzig, he went to Rome, where he edited Homer and the Onomasticon of Julius Pollux for Wetzstein the publisher. Subsequently, at Hamburg, he assisted the great bibliographer J. A. Fabricius in the production of his Bibliotheca Graeca and his edition of Sextus Empiricus. He finally found a permanent post in Bucharest as secretary to the prince of Walachia, Alexander Mavrocordato, whose work Περί τῶν καθηκόντων (De Officiis) he had previously translated for Fritzsch, the Leipzig bookseller, by whom he had been employed as proof-reader and literary hack. In the prince's library BERGLER discovered the introduction and the first three chapters of Eusebius's Demonstratio Evangelica. He died in Bucharest, and was buried at his patron's expense. According to another account, BERGLER, finding himself without means, drifted to Constantinople, where he came to an untoward end (c. 1740). He is said to have become a convert to Islam; this report was probably a mistake for the undisputed fact that he embraced Roman Catholicism. BERGLER led a wild and irregular life, and offended his friends and made many enemies by his dissipated habits and cynical disposition. In addition to writing numerous articles for the Leipzig Acta Eruditorum, BERGLER edited the third edition of the Byzantine biographer Genesios (1733), and the letters of Alciphron (1715), in which seventy-five hitherto unpublished letters were for the first time included.

BERGMAN, TORBERN OLOF (1733-1784), Swedish chemist and naturalist, was born at Katrineberg, Vastergotland, Sweden, on the 20th of March 1735. At the age of seventeen he entered the university of Upsala. His father wished him to read either law or divinity, while he himself was anxious to study mathematics and natural science; in the effort to please both himself and his father he overworked himself and injured his health. During a period of enforced abstinence from study, he amused himself with field botany and entomology, to such good purpose that he was able to send Linnaeus specimens of several new kinds of insects, and in 1756 he succeeded in proving that, contrary to the opinion of that naturalist, Coccus aquaneous was really the ovum of a leech. In 1758, having returned to Upsala, he graduated there, and soon afterwards began to teach mathematics and physics at the university, publishing papers on the rainbow, the aurora, the pyroelectric phenomena of tourmaline, &c. In 1767 Johann Gottschalk Walersius (1700-1785) having resigned the chair of chemistry and mineralogy, BERGMAN determined to become a candidate, though he had paid no particular attention to the subject before. As evidence of his attainments he produced a memoir on the manufacture of alum, but his pretensions were strongly opposed, and it was only through the influence of Gustavus III., then crown prince and chancellor of the university, that he gained the appointment, which he held till the end of his life. He died at Medevi on Lake Vetter on the 8th of July 1784. BERGMAN's most important chemical paper is his Essay on Elective Attractions (1775), a study of chemical affinity. In methods of chemical analysis, both by the blowpipe and in the wet way, he effected many improvements, and he made considerable contributions to mineralogical and geological chemistry, and to crystallography. He also made observations of the transit of Venus in 1761, and published a Physical Description of the Earth in 1766.

His works were collected and printed in 6 vols. as Opuscula Physica et Chemica in 1779-1790, and were translated into French, German and English.

BERGSRUND (Ger. Berg, mountain; Srand, cleft or crevice), a gaping crack in the upper part of a snowfield or glacier, near the rock wall, caused by the glacier moving bodily away from the mountain-side as the mass settles downwards. The crack is roughly parallel to the rock-face of the upper edge of the glacier basin, and extends downwards to the solid rock beneath the glacier where at the bottom of this huge crevasse there are blocks of ice, and large pieces of rock torn off by the lower portion of the glacier from the rock wall and floor.

BERGUES, a town of northern France, in the department of Nord, at the junction of the canal of the Colme with canals to Dunkirk and Furnes (in Belgium), 5 m. S.E. of Dunkirk by rail. Pop. (1906) 4499. The town has a belfry, the finest in French Flanders, dating from the middle of the 16th century and restored in the 19th century. The church of St Martin is a brick building of the 17th century in the Gothic style with a modern façade. The town hall, dating from the latter half of the 19th century, contains a municipal library and an interesting collection of pictures. The industries of the town include brewing and malting, and the manufacture of brushes and oil.

BERHAMPUR, a town of British India, the headquarters of Murshidabad district, in Bengal, situated on the left bank of the river Bhagirathi, 5 m. below Murshidabad city. Pop. (1901) 24,079. BERHAMPUR was fixed upon after the battle of Plassey as the site of the chief military station for Bengal; and a large square of brick barracks was erected in 1767, at a cost of £300,000. Here was committed the first overt act of the mutiny, on the 23rd of February 1857. No troops are now stationed here, and the barracks have been utilized for a jail, a lunatic asylum and other civic buildings. A college, founded by government in 1833, was made over in 1888 to a local committee, being mainly supported by the munificence of the rani Svasnamayi. In the municipality of Berhampur is included the remnant of the once important, but now utterly decayed city of Cossimbazar (q.v.).

BERHAMPUR, a town of British India, in the presidency of Madras. Pop. (1901) 25,729. It is the headquarters of Ganjam district, and is situated about 9 m. from the sea. It is a station on the East Coast railway, which connects Calcutta with Madras. Berhampur had a military cantonment, sometimes distinguished as Baupur, containing a wing of a native regiment; but the troops have been transferred elsewhere. There is some weaving of silk cloth, and export trade in sugar. The college, originally founded by government, is now maintained by the rajah of Kalkotta. Silk-weaving and sugar-manufacture are carried on.

BERI-BERI, a tropical disease of the greatest antiquity, and known to the Chinese from an extremely remote period. It gradually dropped out of sight of European practice, until an epidemic in Brazil in 1865, and the opening up of Japan, where it prevailed extensively, and the investigations into the disease in Borneo, brought it again into notice. The researches of Scheube and Bilz in Japan, and of Pekelharing and Winkler in the Dutch Indies, led to its description as a form of peripheral neuritis (see also NEUROPATHOLOGY). The geographical distribution of beri-beri is between 45° N. and 35° S. It occurs in Japan, Korea and on the Chinese coast south of Shanghai; in Manilla, Tongking, Cochín China, Burma, Singapore, Malacca, Java and the neighbouring islands; also in Ceylon, Mauritius, Madagascar and the east coast of Africa. In the Western hemisphere it is found in Cuba, Panama, Venezuela and South America. It has been carried in ships to Australia and to England. Sir P. Manson has "known it originate in the port of London in the crews of ships which had been in harbour for several months," and he suggests that "the peripheral neuritis occurs in epidemic form it is probably beri-beri. The cause is believed by many authorities to be an infective agent of a parasitic nature, but attempts to identify it have not been entirely successful. It is "not obviously communicable from person to person" (Manson), but may be carried from
place to place. It clings to particular localities, buildings and ships, in which it has a great tendency to occur; for instance, it is apt to break out again and again on certain vessels trading to the East. It haunts low-lying districts along the coast, and the banks of rivers. Moisture and high temperature are required to develop its activity, which is further favoured by bad ventilation, overcrowding and underfeeding. Another strongly supported hypothesis is that it is caused by unwholesome diet. The experience of the Japanese navy points strongly in this direction. Beri-beri was constantly prevalent among the sailors until 1884, when the diet was changed. A striking and progressive diminution at once set in, and continued until the disease wholly disappeared. Major Ronald Ross suggested that beri-beri was really arsenical poisoning. A natural surmise is that it is due to some fungoid growth affecting grain, such as rice, maize or some other food stuff commonly used in the localities where beri-beri is prevalent, and among sailors. The conditions under which their food is kept on board certain ships might explain the tendency of the disease to haunt particular vessels. Dr Charles Hose is the principal advocate of this theory. Having had much experience of beri-beri in Sarawak, he associates it with the eating of mouldy rice, a germ in the fungus constituting the poison. But Dr Hose’s views as to rice have been strongly opposed by Dr Hamilton Wright and others.

The most susceptible age is from 15 to 40. Children under 15 and persons over 50 or 60 are rarely attacked. Men are more liable than women. Race has no influence. Previous attacks powerfully predispose.

The symptoms are mainly those of peripheral neuritis with special implication of the phrenic and the pneumogastric nerves. There is usually a premonitory stage, in which the patient is languid, easily tired, depressed, and complains of numbness, stiffness and cramps in the legs; the ankles are oedematous and the face is puffy. After this, pronounced symptoms set in rapidly, the patient suddenly loses power in the legs and is hardly able to walk or stand; this paresis is accompanied by partial anaesthesia, and by burning or tingling sensations in the feet, legs and arms; the finger-tips are numb, the calf muscles tender. These symptoms increase; the oedema becomes general, the paralysis more marked; breathlessness and palpitation come on in paroxysms; the urine is greatly diminished. There is no fever, unless it is of an incidental character, and no brain symptoms arise. The patient may remain in this condition for several days or weeks, when the symptoms begin to subside. On the disappearance of the oedema the muscles of the leg are found to be atrophied. Recovery is very slow, but appears to be certain when once begun. When death occurs it is usually from syncope through over-distension of the heart. The mortality varies greatly, from 2 to 50% of the cases. The disease is said to be extremely fatal among the Malays. After death there is found to be serious infiltration into all the tissues, and often haemorrhages into the muscles and nerves, but the most important lesion is degeneration of the peripheral nerves. The cerebrospinal centres are not affected, and the degeneration of the nerve-fibres is more marked the farther they are from the point of origin. The implication of the phrenic and pneumogastric nerves, and of the cardiac plexus, accounts for the breathlessness, palpitation and heart failure; that of the vaso-motor system for the oedema and diminution of urine, and that of the spinal nerves for the loss of power, the impairment and perversion of sensation. According as these nerves are variously affected the symptoms will be modified, some being more prominent in one case and some in another.

Authorities.—See Sir Patrick Manson, Tropical Diseases (new ed., 1907); for a critical discussion of the subject, see The Times of 16th October 1905; a full bibliography is given by Manson in Allbutt and Rolleston’s System of Medicine (1907).

BERING (BERING), VITUS (1680–1741), Danish navigator, was born in 1680 at Horsens. In 1703 he entered the Russian navy, and served in the Swedish war. A series of explorations of the north coast of Asia, the outcome of a far-reaching plan devised by Peter the Great, led up to Bering’s first voyage to Kamchatka. In 1725, under the auspices of the Russian government, he went overland to Okhotsk, crossed to Kamchatka, and built the ship “Gabriel.” In her he pushed northward in 1728, until he could no longer observe any extension of the land to the north, or its appearance to the east. In the following year he made an abortive search for land eastward, and in 1730 returned to St Petersburg. He was subsequently commissioned to a further expedition, and in 1740 established the settlement of Petropavlovsk in Kamchatka; and built two vessels, the “St Peter” and “St Paul,” in which in 1741 he led an expedition towards America. A storm separated the ships, but Bering sighted the southern coast of Alaska, and a landing was made at Kayak Island or in the vicinity. Bering was forced by adverse conditions to return quickly, and discovered some of the Aleutian Islands on his way back. He was afflicted with scurvy, and became too ill to command his ships, which were at last driven to refuge on an uninhabited island in the south-west of Bering Sea, where Bering himself and many of his company died. This island bears his name. Bering died on the 19th of December 1741. It was long before the value of his work was recognized; but Captain Cook was able to prove his accuracy as an observer.

See G. F. Müller, Sammlung russischer Geschichten, vol. iii. (St Petersburg, 1758); P. Lauridsen, Bering og de Russiske Opdagelsesrejser (Copenhagen, 1885).

BERING ISLAND. SEA and STRAIT. These take their name from the explorer Vitus Bering. The island (also called Avatcha) which was the scene of his death, lies in the south-western part of the sea, off the coast of Kamchatka, being one of the Commander or Komodor group, belonging to Russia.
BERING SEA ARBITRATION.

From early times plied the trade of middlemen between Asia and America. They called the western island Nunivook and the eastern Igloolik. Haze and fogs greatly prevail in the strait, which is never free of ice.

The earliest names associated with the exploration of Bering Strait are those of Russians seeking to extend their trading facilities. Isai Ignatiev made a voyage eastward from the Kolyma river in 1666, and Simon Dezhnev in 1668 followed his route and prolonged it, rounding the East or Dezhnev Cape, and entering the strait. The post of Anadyrsk was founded on the river Anadyr, and overland communications were gradually opened up. A Russian named Popov first learnt a rumour of the existence of islands east of Cape Dezhnev, and of the proximity of America, and presently there followed the explorations of Vitus Bering. In 1731 the navigator Michael Gvosdev was driven by storm from a point north of Cape Dezhnev to within sight of the Alaskan coast, which he followed for two days. Under Bering on his last voyage (1741) was Commander Chirikov of the “St Paul,” and after being separated from his leader during foggy weather this officer reached the Alaskan coast and explored a considerable stretch of it. Lieutenant Vazhel and William Steller, a naturalist, left at the head of Bering’s party after his death, by their researches laid the foundation of the “proof” of the strait. Islands gradually became known in the pursuit of this trade, in 1741 Michael Novidiskov (1743) and his successors, and it was not until Captain James Cook, working from the south, explored the sea and strait in 1778 that the tide of discovery set farther northward.

BERING SEA ARBITRATION. The important fishery dispute between Great Britain and the United States, which was closed by this arbitration, arose in the following circumstances.

In the year 1867 the United States government had purchased from Russia all her territorial rights in Alaska and the adjacent islands. The boundary between the two powers, as laid down by the treaty for purchase, was a line drawn from the middle of Bering Strait south-west to a point midway between the Aleutian and Komandorski Islands dividing Bering Sea into two parts, of which the larger was on the American side of this line. This portion included the Pribiloff Islands, which are the principal breeding-grounds of the seals frequenting those seas. By certain acts of congress, passed between 1868 and 1873, the king of seals was placed in public tenancy; the sealers came through his group and in “the waters adjacent thereto” except upon certain specified conditions. No definition of the meaning of the words “adjacent waters” was given in the act. In 1870 the exclusive rights of killing seals upon these islands was leased by the United States to the Alaska Commercial Company, upon conditions limiting the numbers to be taken annually, and otherwise providing for their protection. As early as 1872 the operations of foreign sealers attracted the attention of the United States government, but any precautions then taken seem to have been directed against the capture of seals on their way through the passages between the Aleutian Islands, and no claim to jurisdiction beyond the three-mile limit appears to have been put forward. On the 12th of March 1881, however, the acting secretary of the United States treasury, in answer to a letter asking for an interpretation of the words “waters adjacent thereto” in the acts of 1868 and 1873, stated that all the waters east of the boundary line were considered to be within the waters of Alaska territory. In March 1886 this letter was communicated to the San Francisco customs by Mr Daniel Manning, secretary of seals sewing for public tenancy in the name through three British sealers, the “Carolina,” “Onward” and “Thornton,” were captured by an American revenue cutter 60 m. from land. They were condemned by the district judge on the express ground that they had been sealing within the limits of Alaska territory. Diplomatic representations followed, and an order for release was issued, but in 1887 further captures were made and were judicially supported upon the same grounds. The respective positions taken up by the two governments in the controversy which ensued may be thus indicated. The United States claimed as a matter of right an exclusive jurisdiction over the sealing industry in Bering Sea; they also contended that the protection of the fur seal was, upon grounds both of morality and interest, an international duty, and should be secured by international arrangement. The British government repudiated the claim of right, but were willing to negotiate upon the question of international regulation. Between 1887 and 1890 negotiations were carried on between Russia, Great Britain and the United States with a view to a joint convention. Unfortunately the parties were unable to agree as to the principles upon which regulation should be based. The negotiations were wrecked upon the question of pelagic sealing. The only seal nurseries were upon the Pribiloff Islands, which belonged to the United States, and the Komandorski group, which belonged to Russia. Consequently to prohibit pelagic sealing would have been to exclude Canada from the industry. The United States, nevertheless, insisted that such prohibition was indispensable on the grounds—(1) that pelagic sealing involved the destruction of breeding stock, because it was practically impossible to distinguish between the male and female seal when in the water; (2) that it was unnecessarily wasteful, inasmuch as a large proportion of the seals so killed were lost. On the other hand, it was contended by Great Britain that in all known cases the pelagic sealing was done by Russian protected vessels upon land, and had never been caused by sealing exclusively pelagic. The negotiations came to nothing, and the United States fell back upon their claim of right. In June 1890 it was reported that certain American revenue cutters had been ordered to proceed to Bering Sea. Sir Julian Pauncfetle, the British ambassador at Washington, having failed to obtain an assurance that British vessels would not be interfered with, laid a formal protest before the United States government.

Thereupon followed a diplomatic controversy, in the course of which the United States developed the contentions which were afterwards laid before the tribunal of arbitration. The claim that Bering Sea was mare clausum was abandoned, but it was asserted that Russia had formerly exercised therein rights of exclusive jurisdiction which had passed to the United States, and they relied inter alia upon the ukase of 1821, by which foreign vessels had been forbidden approach within 100 Italian miles of the coasts of Russian America. It was pointed out by Great Britain that this ukase had been the subject of protest both by Great Britain and the United States, and that by treaties similar in their terms, made between Great Britain, the United States, and Russia, it had been agreed that their subjects should not be troubled or molested in navigating or fishing in any part of the Pacific Ocean. The American answer was that the Pacific Ocean did not include Bering Sea. They also claimed an interest in the fur seals, involving the right to protect themselves outside the three-mile limit. In August 1890 Lord Salisbury proposed that the question at issue should be submitted to arbitration. This was ultimately assented to by the secretary of state, James Gillespie Blaine, on the understanding that certain specific points, which he indicated, should be laid before the arbitrators. On the 29th of February 1892 a definitive treaty was signed at Washington. Each power was to name two arbitrators, and the president of the French Republic, the king of Italy, the king of Norway and Sweden were each to name one. The points submitted were as follows:—(1) What exclusive jurisdiction in the sea now known as Bering Sea, and what exclusive rights in the seal fisheries therein, did Russia assert and exercise prior to and up to the time of the cession of Alaska to the United States? (2) What law should be adopted to settle the possession of the cession of Alaska, according to the her claims of jurisdiction as to the seal fisheries therein? Was Russia the discoverer and first occupied? (4) Was the body of water now known as Bering Sea included in the phrase “Pacific Ocean,” as used in the treaty of 1825 between Great Britain and Russia, and what rights, if any, in Bering Sea were held exclusively exercised by Russia after the said treaty? (4) Did not all the rights of Russia as to jurisdiction and as to the seal fisheries in Bering Sea east of the water boundary, in the treaty between the United States and Russia of the 30th o-
BERIO—BERKELEY FAMILY

BERIA, a town of southern Spain, in the province of Almeria; on the south-eastern slope of the Sierra de Gádor, 10 m. N.E. of Adra by road. Pop. (1890) 13,724. Despite the lack of a railway Beria has a considerable trade. Lead is obtained among the mountains, and the more sheltered valleys produce grain, wine, oil, fruit and esparto grass. These, with the paper, linen and cotton goods manufactured locally in small quantities, are exported from Adra.

BERKA, a town and watering-place of Germany, in the grand-duchy of Saxe-Weimar, on the Ilm and the Weimar-Kranichfeld railway, 8 m. S. of Weimar. Pop. 2300. It has sulphur baths, which are largely frequented in the summer. Berka was once celebrated for its Cistercian nunnery, founded in 1251. Two m. down the Ilm is the curious castle of Burgfarth, partly hewn out of the solid rock.

BERKELEY, the name of an ancient English family remarkable for its long tenure of the feudal castle built by the water of Severn upon the lands from which the family takes its name. It traces an undoubted descent from Robert (d. 1170) son of Harding. Old pedigree-makers from the 14th century onward have made of Harding a younger son of a king of Denmark and a member of the English baronage, but this appears to have been an attempt to link his identity with one Harding who, although an English thame, is recorded by Domesday Book in 1086 as a great landowner in Somerset. This Harding the thame was son of Elnod or Alnud, who is recognized as Eadnoth the Staller, slain in beating off the sons of Harold when they attacked his county. But if Harding the Berkeley ancestor be the Harding who, as the queen's butler, witnessed King Edward's Waltham charter of 1065, his dates seem strangely apart from those of Robert his son, dead a hundred and eight years later. Of Robert fitz Harding we know that he was a Bristol man whose wealth and importance were probably increased by the trade of the port. A partisan of Henry, son of the empress, that prince before his accession to the throne granted him, by his charter at Bristol in the earlier half of 1153, the Gloucestershire manor of Bitton, and a hundred librates of land in the manor of Berkeley. Henry agreeing to strengthen the castle of Berkeley, which was evidently already in Robert's hands. In his rhymed chronicle Robert of Gloucester tells how—

"A bourgeois at Bristol—Robert Harding
Vonzet treurer and richesesso was mid the king
That he gat him and is eins—the noble baronie
That so riche is of Berkeley—mid al the seignorie."

Later in the same year the duke of Normandy granted to Robert fitz Harding Berkeley manor and the appurtenant district called "Berkelaihernes," to hold in fee by the service of one knight or at a rent of 100 s. Being at Berkeley, the duke confirmed to Robert a grant of Bedminster made by Robert, earl of Gloucester, and in the first year of his reign as king of England he confirmed his own earlier grant of the Berkeley manor. About this time Robert, who had founded St Augustine's Priory in Bristol, gave to the Black Canons there the five churches in Berkeley and Berkeley Hersis. In their priory church he was buried in 1170, Berkeley descending to his son and heir Maurice.

Berkeley had already given a surname to an earlier family sprung from Roger, its Domesday tenant, whose descendants seem to have been ousted by the partisans of the Angevins. But if these had been divided between the families it was ended by a double alliance, a covenant having been made at Bristol about November 1153 in the presence of Henry, duke of Normandy, whereby Maurice, son of Robert fitz Harding, was to marry the daughter of Roger of Berkeley, Roger's own son Roger marrying the daughter of Robert. In his certificate of 1166 Robert tells the king that, although he owes the service of five knights for Berkeley, Roger of Berkeley still holds certain lands of the honour for which he does no service to Robert. This elder line of Berkeley survived for more than two centuries on their lands of Dursley and Cubberley, but after his father's death Maurice, son of Robert, is styled Maurice of Berkeley. Robert of Berkeley, the eldest son of Maurice, paid in 1190 the vast sum of £1000 for livery of his great inheritance, but, rising with the rebellious
BERKELEY FAMILY

berkley against king john, his castle was taken into the king's hands. seisin, however, was granted in 1220 to thomas his brother and heir, but the estate was again forfeit in the next generation for a new defection, although the wind of the royal displeasure was tempered by the fact that isabel de creoun, wife of maurice, lord of berkley, was the king's near kinswoman. thomas, son of maurice, was allowed to succeed his father in the lands, and, having a writ of summons to parliament in 1295, he is reckoned the first hereditary baron of the line.

even in the age of chivalry the lords of berkley were notable warriors. thomas, who as a lad had ridden on the barons' side at evesham, followed the king's wars for half a century of his long life, flying his banner at falkirk and at bannockburn, in which flight he was taken by the scots. his seal of arms is among those attached to the famous letter of renunciation addressed by the barons of england to pope boniface viii. maurice, his son, joined the confederacy against the two despensers, and lay in prison at wallingford until his death in 1326, the queen's party gaining the upper hand too late to release him.

but as the queen passed by berkley on her way to seize bristol, she gave back the castle, which had been kept by the younger despenser, to thomas, the king's heir, who, with sir john mautravers, gave in his honor the king's court. the chroniclers agree that thomas of berkley had no part in the murder of the king, whom he treated kindly. it was when thomas was away from the castle that mautravers and gournay made an end of their charge. through the providence of this thomas the berkley estates were saved to the male line of his house, a fine levied in the twenty-third year of edward iii. so settling them. thomas of berkley fought at crecy and calais, bringing six knights and thirty-two squires to the siege in his train, with thirty mounted archers and two hundred men on foot. his son and heir-apparent, maurice of berkley, was the hero of a misadventure recorded by froissart, who tells how a young english knight, displaying his banner for the first time on the day of poitiers, rode after a flying picard squire, by whom he was grievously wounded and held to ransom. froissart errs in describing this knight as thomas lord of berkley, for the covenant made in 1360 for the release of maurice is still among the berkley muniments, the ransom being stated at £100.

berkley castle is associated with the earl of roger mortimer, earl of march, the paramour of queen isabel. maurice berkley married elizabeth, daughter of hugo despenser, the younger of edward ii's favourites and the intruder in berkley castle. with his son and heir thomas of berkley, one of the commissioners of parliament for the deposing of richard ii. and a warden of the welsh marches who harbored owen of glendower, the direct male line of robert fitz harding failed, and but for the settlement of the estates berkley would have passed from the family. on this thomas's death in 1417 elizabeth, his daughter and heir, and her husband, richard beauchamp, earl of warwick, the famous traveller, statesman and jouster, seized berkley castle. earl and countess only withdrew after james berkley, the nephew and heir male, had livery of his lands by the purchased aid of humphrey of gloucester. but the beauchamps returned more than once to vain attacks on the stout walls of berkley, and a quarrel of two generations ended with the pitched battle of niblet green. fought between the retainers of william, lord berkley, son of james, and those who followed thomas talbot, viscount lisle, grandson of the illustrious talbot and great-grandson of the conqueror of warwick, this was the last private battle on english ground between two feudal lords. young lisle was shot under the beaver by an arrow, and the feud ended with his death, all claims of his widow being settled with an annuity of £100. bitter as was the long quarell, it kept the berkleys from casting their interest into the wars of the roses, in which most of their fellows of the ancient baronage sank and disappeared.

the victorious lord berkley, whose children died young, was on ill terms with his next brother, and made havoc of the great berkley estates by grants to the crown and the royal house, for which he was rewarded with certain official titles. edward iv. gave him a viscount's patent in 1482, and richard iii. created him earl of nottingham in 1485. his compliance extending to the new dynasty, henry vii. made him earl marshal in 1485 and marquis of berkley in 1487. for this last patent he, by a settlement following a recovery suffered, gave the king and his heirs male berkley castle and all that remained to him of his ancestors' lands, enjoying for his two remaining years a bare life interest. at his death in 1491 the king took possession, bringing his queen with him on a visit to berkley.

here follows a curious chapter of the history of the berkley peerage. when thomas, lord berkley, died in 1417, it might have been presumed that his dignity would descend to his heir, the countess of warwick. nevertheless, his nephew and heir male was summoned as a baron from 1421, apparently by reason of his tenure of the castle and its lands. when the marquess of berkley was dead without surviving issue, the castle having passed to the crown, maurice, the brother and heir, had no summons. yet this maurice's son, another maurice, had a summons as a baron, although not "with the room in the parliament chamber that the lords of berkley had of old time." the old precedence was restored with thomas, brother and heir male. this thomas, who had a command at flodden, held his ancestors' castle as constable for the king. a final remainder under the marquess's settlement brought back castle and lands on the failure in 1553 of the heirs male of the body of henry vii., and henry, lord berkley, had special livery of them in his minority. yet although seized of the castle he took a lower seat in the parliament house than did his grandfather who was not so seized, being given place after abergavenny, audley and strange.

by these things we may see that peerage law in old time rested upon the pleasure of the sovereign and upon no ascertained and unvarying custom. of the power behind that pleasure this henry, lord berkley, had one sharp reminder. he was, like most of his line, a keen sportsman, and, returning to berkley to find that a royal visit had made great slaughter among his deer, he showed his resentment by disapproving berkley park.

thereat queen elizabeth sent him a warning in round tudor fashion. let him beware, she wrote, for the earl of leicester could take the castle by the sword.

at the restoration george lord berkley, who had been one of the commissioners to invite charles ii.'s return from the hague, petitioned for a higher place in parliament, claiming a barony by right of tenure before 1295, but his claim was silenced by his advancement on september 11, 1679, to be viscount of dursley and earl of berkley. james, the third earl, an active sea captain who was all but lost in company with sir cloudeley shovel, became knight of the garter and lord high admiral and commander-in-chief in the channel, he and his house being loyal supporters of the hanoverian dynasty.

the last and most curious chapter of the history of the berkley honours was opened by frederick augustus, the 5th earl of berkley (1745-1810). this peer married at lambeth, on the 10th of may 1766, one mary cole, the daughter of a small tradesman at wotton-under-edge, with whom he had already lived for several years, several children having been born to them. in order to legitimate the issue born before the marriage, the earl in 1801 made declaration of an earlier marriage contracted privately at berkley in 1785. on his death in 1811 the validity of this marriage was challenged by the committee of the house of lords, and it was shown without doubt that the evidence for it, a parish register entry, was a forgery.

under the will of his father, colonel william berkley, the eldest illegitimate son, had the castle and estates, and on the failure of his claim to the earldom he demanded a writ of summons as a baron by reason of his tenure of the castle. no judgment was given in the matter, the king in council having declared in 1669 that baronies by tenure were "not in being and so not fit to be revived." but colonel berkley's political influence afterwards procured him (1831) a peerage as lord segrave of
BERKELEY, BISHOP

Berkeley, and ten years later an earldom with the title of Fitzhardinge. He died without issue in 1537. His brother, Sir Maurice Fitzhardinge Berkeley, who succeeded to Berkeley under the terms of the 5th earl's will, revived the claims, and was likewise given a new barony (1681) as Lord Fitzhardinge, a title in which he was succeeded by two of his sons, the 3rd baron (b. 1830) being in 1909 owner of the Berkeley and Cranford estates. The earldom of Berkeley was never assumed by the eldest legitimate son of the 5th earl, and was in 1909 enjoyed by Randal Thomas Mowbray Berkeley, 5th earl, grandson of admiral Sir George Cranfield Berkeley, second son of the 4th earl. In 1803 Mrs Milman (d. 1890), daughter and heir of Thomas Moreton Fitzhardinge Berkeley, 6th earl de jure, was declared by letters patent under the great seal to have succeeded to the ancient barony of Berkeley created by the writ of 1421; and she was succeeded by her daughter.

Many branches have been thrown out by this family during its many centuries of existence. Of these the most important descended from Maurice of Berkeley, the baron who died in Wallingford in 1176. His second son Maurice was ancestor of the Berkeleys of Stoke Giffard, whose descendant, Norborne Berkeley, claimed the barony of Botetourt and had a summons in 1764, dying without issue in 1770. Sir Maurice Berkeley of Bruton, a cadet of Stoke Giffard, was forefather of the Viscounts Fitzhardinge, the Lords Berkeley of Stratton (1658-1773) and the earls of Falmouth, all extinct, the Berkeleys of Stratton bequeathing their great London estate, including Berkeley Square and Stratton Street, to the main line. Edward Berkeley of Pylle in Somerset, head of a cadet line of the Bruton family, married Philippa Speke, whose mother was Joan, daughter of Sir John Portman of Orchard Portman, baronet. His grandson William, on succeeding to the Orchard Portman and Bryanston estates, took the additional name of Portman, and from him come the Viscounts Portman of Bryanston (1873). From James, Lord Berkeley, who died in 1463, descended Rowland Berkeley, a clothier of Worcester, who bought the estates of Spetchley. Rowland's second son, Sir Robert Berkeley, the king's bench justice who supported the imposition of ship-money, was ancestor of the Berkeleys of Spetchley, now the only branch of the house among untitled squires.

BERKELEY, GEORGE (1685-1753), Irish bishop and philosopher, the eldest son of William Berkeley, whose officers of what had it seems, come to Ireland in the suite of Lord Berkeley of Stratton, lord lieutenant, 1670-1672, to whom he was related, was born on the 14th of March 1685, in a cottage near Dysert House, Thomastown, Ireland. He passed from the school at Kilkenny to Trinity College, Dublin (1700), where, owing to the peculiar subtlety of his mind and his determination to accept no doctrine or the evidence of authority or convention as unquestioned, he was regarded as a dandy, by others as a genius. During his career at Dublin the works of Descartes and Newton were superseding the older text-books, and the doctrines of Locke's Essay were eagerly discussed. Thus he "entered on an atmosphere which was beginning to be charged with the elements of reaction against traditional scholasticism in physics and in metaphysics" (A. C. Fraser). He became a fellow in 1707. His interest in philosophy led him to take a prominent share in the foundation of a society for discussing the new doctrines, and is further shown by his Common Place Book, one of the most valuable autobiographical records in existence, which throws much light on the growth of his ideas, and enables us to understand the significance of his early writings. We find here the consciousness of creative thought focused in a new principle which is to revolutionize speculative science.

There is no sign of any intimate knowledge of ancient or scholastic thought; to the doctrines of Spinoza, Leibnitz, Malebranche, Norris, the attitude is one of indifference or lack of appreciation, but the influence of Descartes and specially of Locke is evident throughout. The new principle (nowhere in the Common Place Book explicitly stated) may be expressed in the proposition that no existence is conceivable—and therefore possible—which is not either conscious spirit or the ideas (i.e. objects) of which such spirit is conscious. In the language of a later period this principle may be expressed as the absolute synthesis of subject and object; no object exists apart from Mind. Mind is, therefore, prior both in thought and in existence, if for the moment we assume the popular distinction. Berkeley thus diverted philosophy from its beaten track of discussion as to the meaning of matter, substance, cause, and preferred to ask first whether these have any significance apart from the conscious spirit. In the pursuit of this inquiry he rashly invaded other departments of science, and much of the Common Place Book is occupied with a polemic, as vigorous as it is ignorant, against the fundamental conceptions of the infinitesimal calculus.

In 1707 Berkeley published two short mathematical tracts; in 1709, in his New Theory of Vision, he applied his new principle for the first time, and in the following year stated it fully in the Principles of Human Knowledge. In these works he attacked the existing theories of externality which to the philosophical mind is proved by visual evidence. He maintained that visual consciousness is merely a system of arbitrary signs which symbolize for us certain actual or possible tactual experience—in other words a purely conventional language.

The contents of the visual and the tactual consciousness have no element in common. The visible and visual signs are definitely connected with tactual experiences, and the association between them, which has grown up in our minds through custom or habit, rests upon, or is guaranteed by, the constant conjunction of the two by the will of the Universal Mind. But this synthesis is not brought forward prominently by Berkeley. It was evident that a similar analysis might have been applied as well to consciousness which does not give externality in its deepest significance any more than the visual; but with deliberate purpose Berkeley at first drew out only one side of his argument.

In the Principles of Human Knowledge, externality in its ultimate sense as independence of all mind is considered. Matter, as an abstract, unperceived substance or cause, is shown to be impossible, an unreal conception; true substance is affirmed to be conscious spirit, true causality the free activity of such a spirit, while physical substantiality and causality are held to be merely arbitrary, though constant, relations among phenomena connected subjectively by suggestion or association, objectively in the Universal Mind. In ultimate analysis, then, nature is conscious experience, and forms the sign or symbol of a divine, universal intelligence and will.

In 1711 Berkeley delivered his Discourse on Passive Obedience, in which he deduces moral rules from the intention of God to promote the general happiness, thus working out a theological utilitarianism, which may be compared with the later expositions of Austin and J. S. Mill. From 1707 he had been engaged as college consciousness which does not give externality in its deepest significance any more than the visual; but with deliberate purpose Berkeley at first drew out only one side of his argument.

divinity lecturer and university preacher. In 1722 he was appointed to the deanship of Dromore, a post which seems to have entailed no duties, as we find him holding the office of Hebrew lecturer and senior proctor at the university. The following year, his friend, the Vanbrugh, Swift’s Vanessa, left him half her property. It would appear that he had only met her once at dinner. In 1724 he was nominated to the rich deanship of Derry, but had hardly been appointed before he was using every effort to resign it in order to devote himself to the scheme of founding a college in the Bermudas, and extending its benefits to the Americans. With infinite exertion he succeeded in obtaining from government a promise of £6,000, and after four years spent in preparation, sailed in September 1728, accompanied by some friends and by his wife, daughter of Judge Forster, whom he had married in the preceding month. Three years of quiet retirement and study were spent in Rhode Island, but it gradually became apparent that government would never hand over the promised grant, and Berkeley was compelled to give up his cherished plan. Soon after his return he published the fruits of his studies in Alciphron; or, the Minute Philosopher (1733), a finely written work in the form of dialogue, critically examining the various forms of free-thinking in the age, and bringing forward in antithesis to them the showing off the immortality of the soul and of God. In 1734 he was raised to the bishopric of Clony. The same year, in his Analyst, he attacked the higher mathematics as leading to freethinking; this involved him in a hot controversy. The Quest, a practical work in the form of questions on what would now be called social or economical philosophy, appeared in three parts, 1735, 1736, 1737. In 1744 was published the Siris, partly occasioned by the controversy as to the efficacy of tar-water in cases of small-pox, but rising far above the circumference from which it took its rise, and revealing hidden depths in the Berkelean metaphysics. In 1751 his eldest son died; and in 1752 he removed with his family to Oxford for the sake of his son George, who was studying there. He died suddenly in the midst of his family on the 14th of January 1753, and was buried in Christ Church, Oxford.

In the philosophies of Descartes and Locke a large share of attention had been directed to the idea of matter, which was held to be the abstract, unperceived background of real experience, and was supposed to give rise to our ideas of external things through its action on the sentient mind. Knowledge being limited to the ideas produced, and so not open to the unperceived matter, or substance, or cause which produced them, and became a problem for speculative philosophy. Berkeley, in his analyses, brings to the front the importance of the existence of the soul and of God. Philosophy seemed about to end in scepticism or materialism. New Berkeley put this whole problem in a new light by pointing out a preliminary question. Before we deduce results from sensations, does it not imply that there is a cause, that the world in reality do these mean—what is the actual content of consciousness which corresponds to these words? Do not all these ideas, when held to represent something which exists absolutely apart from all knowledge of it, involve a contradiction? In putting this question, Berkeley is thinking of consciousness, its content, and its originality as a philosopher. The essence of the answer is that the universe is inconceivable apart from mind—that existence, as such, denotes conscious spirits and the objects of consciousness. Matter and substance, both of them are identical with consciousness. Experiences of conscious existence beyond the circle of consciousness, are impossible, inconceivable. External things are things known to us in immediate perception. To conclude Berkeley seems, in the first place, to have laid the foundation of modern subjective or egoistic idealism. It is impossible to overstrep the limits of self-consciousness; whatever words I use, whatever notions I have, must refer to and find their meaning in facts of conscious experience, and not know whether they have an independent reality either in the world or in the mind; both belong to the individual mind. To Berkeley, however, the difference is fundamental; sense ideas are not due to our own activity; they must therefore be produced by some other cause. This is an independent action, upon our minds of supreme active intellect, and is not the consequence of dead inert matter. It might appear, therefore, that sensible things have an objective existence in the mind of God; that an idea so soon as it passes out of our consciousness passes into that of God, and is there presented to us by some justice, put upon Berkeley’s own expression. But it is not a satisfactory account of his theory. Berkeley is compelled to say that an immediate perception is not a thing, and that what we consider permanent or substantial is not a sensation but a group of qualities, which in ultimate analysis means sensations either immediately felt or subjectively perceived, and which is caused by the will of the divine intelligence, they are caused, and caused in a regular order; there exists in the divine mind archetypes, of which sense experience may be said to be the realization in our finite minds. The idea of the archetypes is derived from the concept of the association in our minds of actual and possible sensations means belief in the orderliness of nature, and that is merely assurance that the universe is pervaded and regulated by mind. Physical science and philosophy may claim to decipher the divine ideas which find realization in our limited experience, in trying to interpret the divine language of which natural things are the words and letters, and in striving to bring human conceptions into harmony with the divine archetypes. Moreover, the idea of the living, the known, the unknown, a living, active mind is looked upon as the centre and spring of the universe, and this is the essence of the Berkelean metaphysics.

Berkeley’s new thought has been almost universally neglected or misunderstood. Of his spiritual empiricism one side only has been accepted by later thinkers, and looked upon as the whole. The subjective mechanism of association which is Berkeley’s but part of the true explanation, and its independence of the source of the other side; the fact that the idea of an objective external reality has been received as in itself a satisfactory theory. Such Cagitations has been regarded by thinkers who profess themselves Berkeleyans as the one proposition warranted by consciousness; the empiricism of his philosophy is reduced to a kind of associationism, without which the whole is to Berkeley meaningless, has been cast aside. For this he is himself in no small measure to blame. The deeper spiritual intuition, present from the first, was only brought into the foreground of exposition by the rejection of the idea of an objective external reality, the extension of the intuition itself beyond the limits of our own consciousness, which completely removes his position from the domain of subjective, rests on foundations uncritically assumed, and at which sight he or the empiricism, in its original sense, never entirely presents, involves some reference to the objective course of nature or thought of the divine mind. And if so, what is the nature of the notions necessarily implied in the simplest knowledge of a thing, as distinct from the idea of feeling? That in knowing anything, the ideas of such things are nothing, and their copies is at times dimly seen by Berkeley himself; but he was content to propound a question with regard to those notions, and to look upon them as merely Locke’s ideas of relation. Such ideas, Berkeley thought, can only be known by the mind, and Berkeley’s empiricism is equally far from accounting for them.

With these defects, however, Berkeley’s new conception marks a departure from the old Berkeley; it is not thought. His true place in the history of speculation may be seen from the simple observation that the difficulties that arise in his scheme are really the points on which later philosophy has turned. He once for all lived the problems of his own generation; his and many of his ideas are without a past, and in conjunction with his successor, Hume, determined the form into which later metaphysical questions have been thrown.

BERKELEY, MILES JOSEPH (1803-1889), English botanist, was born on the 1st of April 1803, at Biggin Hall, Northamptonshire, and educated at Rugby and Christ's College, Cambridge, of which he became an honorary fellow. Taking holy orders, he became incumbent of Apethorpe in 1837, and vicar of Sibbertoft, near Market Harborough, in 1838. He acquired an enthusiastic love of cryptogamic botany in his early years, and soon took his hand at literary work, and was the leading British author on fungi and plant pathology. He was especially famous as a systematicist in mycology, some 6000 species of fungi being credited to him, but his Introduction to Cryptogamic Botany, published in 1857, and his papers on "Vegetable Pathology" in the Gardener's Chronicle in 1854 and onwards, show that he had a very broad grasp of the whole domain of physiology and morphology as understood in those days. Moreover, it should be pointed out that Berkeley began his work as a field naturalist and collector, his earliest objects of study having been the mollusca and other branches of zoology, as testified by his papers in the Zoological Journal and the Magazine of Natural History, between 1828 and 1836. As a microscopist he was an assiduous and accurate worker, as is shown by his numerous drawings of the smaller algae and fungi, and his admirable dissections of mosses and hepaticae. His investigations on the potato murrain, caused by Phytophthora infestans, on the grape mildew, to which he gave the name Oidium Tuckeri, and on the pathogenic fungi of wheat rust, hop mildew, and various diseases of cabbage, pears, collards, onions, tomatoes, &c., were important results bearing on the life-history of these pests; at a time when very little was known of such matters, and must always be considered in any historical account of the remarkable advances in the biology of these organisms which were made between 1850 and 1880; and when it is remembered that this work was done without any of the modern appliances or training of a properly equipped laboratory, the real significance of Berkeley's pioneer work becomes apparent. It is as the founder of British mycology, however, that his name will live in the history of botany, and his most important work is contained in the account of native British fungi in Sir W. Hooker's British Flora (1836), in his Introduction to Cryptogamic Botany (1857), and in his Outlines of British Fungology (1865). His magnificent herbarium at Kew, which contains over 9000 specimens, and is enriched by numerous notes and sketches, forms one of the most important type series in the world. Berkeley died at Sibbertoft on the 30th of July 1889. He was a man of refined and courteous bearing, an accomplished classical student, with the simple and modest habits that befit a man of true learning.

A list of his publications will be found in the Catalogue of Scientific Bequests of the Royal Society, and sketches of his life in Proc. Roy. Soc., 1890, 47, 9, by Sir Joseph Hooker, and Annals of Botany, 1897, 11, by Sir W. T. Thisleton-Dyer. (H. M. W.)

BERKELEY, SIR WILLIAM (c. 1668-1677), British colonial governor in America, was born in or near London, England, about 1668, the youngest son of Sir Maurice Berkeley, an original member of the London Company of 1606, and brother of John, first Lord Berkeley of Stratton, one of the proprietors of the Carolinas. He graduated at Oxford in 1629, and in 1632 was appointed one of the royal commissioners for Canada, in which office he won the personal favour of Charles I., who appointed him a gentleman of the privy chamber. During this period he tried his hand at literary work, producing among other things a tragi-comedy entitled The Lost Lady (1638). In August 1641 he was appointed governor of Virginia, but did not take up his duties until the following year. His first term as governor, during which he seems to have been extremely popular with the majority of the colonists, was notable principally for his religious intolerance and his expulsion of the Puritans, who were in a great minority. During the Civil War in England he remained loyal to the king, and offered an asylum in Virginia to Charles II. and the loyalists. On the arrival of a parliamentary fleet in 1652, however, he retired from office and spent the following years quietly on his plantation. On the death, in 1660, of Samuel Matthews, the last parliamentary governor, he was chosen governor by the Virginia assembly, and was soon recommissioned by Charles II. His natural arrogance and tyranny seems to have increased with years, and the second period of his governorship was a stormy one. Serious frontier warfare with the Indians was followed (1676) by Bacon's Rebellion (see Virginia), brought on by Berkeley's misrule, and during its course all his worst traits became evident. His cruelty and barbarity in punishing the rebels did not meet with the approval of Charles II., who is said to have remarked that "the old fool has put to death more people in that naked country than I did here for the murder of my father." Berkeley was called to England in 1677 ostensibly to report on the condition of affairs in the colony, and a lieutenant-governor (Herbert Jeffreys) was put in his place. Berkeley sailed in May, but died soon after his arrival, at Twickenham, and was buried there on the 13th of July 1677. In addition to the play mentioned he wrote A Discourse and View of Virginia (London, 1666).

BERKELEY, a city of Alameda county, California, U.S.A., on the E. shore of San Francisco Bay, named after Bishop Berkeley on account of his line "Westward the course of empire takes its way." Pop. (1890) 5101; (1900) 13,214, of whom 3216 were foreign-born; (1910) 40,434. It is served by the Southern Pacific and the Santa Fé railway systems, both transcontinental; and is connected by electric lines (and ferry) with San Francisco, and by five electric lines with Oakland. Its attractive situation and pleasant outlooks have made it a favourite residential suburb of San Francisco, which lies at a distance of 7 m. across the bay. Berkeley is the seat of the California state university (see California, University of), opened in 1873; the inter-related Berkeley Bible Seminary (1896, Disciples of Christ); Pacific Theological Seminary (established in 1866 at Oakland, in 1901 at Berkeley, Congregational); Seminary of the Pacific Coast Baptist Theological Union, and Unitarian Theological School—all associated with the University of California; and the state institution for the deaf, dumb and blind. The site of Berkeley was a farming region until its selection for the site of the university. Berkeley was incorporated as a town in 1878.

BERKELEY, a market town of Gloucestershire, England, near the river Severn, in that portion of its valley known as the Vale of Berkeley, on a branch from the Midland railway. Pop. (1901) 774. It is pleasantly situated on a gentle eminence, in a rich pastoral vale to which it gives name, celebrated for its dairies, producing the famous cheese known as "double Gloucester." The town has a handsome church (Early English and Decorated), a grammar school, and some trade in coal, timber, malt and cheese. Berkeley was the birthplace of Dr Edward Jenner (1749), who is buried in the church. Berkeley Castle, on an eminence south-east of the town, is one of the noblest baronial castles existing in England, and one of the few inhabited. The Berkeley Ship Canal connects Gloucester with docks at Sharpness, avoiding the difficult navigation of the upper part of the Severn estuary.

The manor of Berkeley gives its name to the noble family of Berkeley (q.v.). According to tradition, a munument to which the manor belonged existed here before the Conquest, and Earl Godwin, by bringing about its dissolution, obtained the manor. All that is certainly known, however, is that in Domesday the manor is assigned to one Roger, who took its surname from it. His descendants seem to have been ousted from their possessions during the 13th century by Robert Fitz Harding, an Angevin partisan, who already held the castle when, in 1153, Henry, duke of Normandy (who became King Henry II. in the following year), granted him the manor. Under an agreement made in the same year, Maurice, son of Robert Fitz Harding, married a daughter
BERKHAMSTEAD—BERKSHIRE

of Roger of Berkeley. Their descendants styled themselves of Berkeley, and in 1200 the town was confirmed to Robert of Berkeley with toll, soc, sac, &c., and a market on whatever day of the week he chose to hold it. This charter was confirmed to Thomas, Lord Berkeley, in 1330, and in 1395–1396 Lord Berkeley received a grant of another fair on the vigil and day of Holyrood. The descendants of the Berkeley family still hold the manor and town. Berkeley Castle was the scene of the death of Edward II. The king was at first entrusted to the care of Lord Berkeley, who, being considered too lenient, was obliged to give up his prisoner and castle to Sir John Mautravers and Thomas Gournay. The town has no charter, but is mentioned as a borough in 1284–1285. It was governed by a mayor and twelve aldermen, but by 1864 their privileges had become merely nominal, and the corporation was dissolved in 1885 under the Municipal Corporations Act. Berkeley was formerly noted for the manufacture of clothing, but the trade had decreased by the 16th century, for Leland, writing about 1520, says "the town of Berkeley is no great thing. . . . It hath very much occupied and yet the meanest of the clothing." See other notes on Hearne's History of Berks (1810).

BERKHAMSTEAD (Great Berkhamstead), a market town in the Watford parliamentary division of Hertfordshire, England, 28 m. N.W. from London by the London & North-Western railway. Pop. of urban district (1901) 5140. It lies pleasantly in the narrow well-wooded valley of the Bulbourne, and is close to the Grand Junction canal. The church of St Peter, a large cruciform structure, exhibits all the Gothic styles, and earlier fragments are traceable. There are several brasses of interest. The poet William Cowper was born in the rectory in 1731. The large grammar school is a foundation of 1541. Straw-plaiting and the manufacture of small wooden wares are the principal industries, and there are large chemical works. Of the castle earthworks and fragments of walls remain. The name of the town is Great Berkhamstead (or Berkhamsted), in distinction from Little Berkhamstead near Hatfield in this county. Berkhamstead (Berkhamsdete, Berchehamstede) was undoubtedly of some importance in Saxon times since there were fifty-two burgesses there at the time of the Conquest. In 1156 Henry II. granted the men and merchants of the town the same laws and customs as they had in the time of Edward the Confessor, and that they should be quit of toll throughout England, Normandy, Aquitaine and Anjou. Berkhamstead rose to importance with its castle, which is said to have been built by Robert, count of Mortain, and when the castle fell into ruin after 1496 the town also began to decay. In 1618, however, the burgesses received an incorporation charter; but after the civil wars the corporate body began to fail through poverty, and in the 18th century had ceased to exist. The burgesses returned two members to parliament in 1320 and again in 1338 and 1341, but were never represented again. Before the 15th century the burgesses held a weekly market on Sunday and a yearly fair on St James's day, but in 1218 Henry III. altered the market day to Monday. Roofing tiles were manufactured in Berkhamstead as early as the 13th century, and in Elizabeth's reign the making of them was the chief industry.

BERKSHIRE, THOMAS HOWARD, 1st Earl of (1587–1660), and son of Thomas Howard, 1st earl of Suffolk and of Catherine, daughter of Sir Henry Knevet, Kt., widower of Richard Rich, was baptized on the 8th of October 1587. He succeeded to his mother's estate of Charlton in Wiltshire, was created K.B. in 1605, became master of the horse to Prince Charles, and was created Lord Howard of Charlton and Viscount Andover in 1622, K.G. in 1625, and earl of Berkshire in 1626. In 1624 he was chosen high steward of the university of Oxford. He was a commissioner for negotiating the treaty of Ripon in 1640, and accompanied the king to York in 1642. While attempting to execute the king's commission of array in Oxfordshire in August he was taken prisoner by Hampden at Waltham and imprisoned in the Tower, but after being censured by the Lords was liberated in September. In 1643 he was made governor of the prince of Wales, a post for which he was in no way fitted, and in which he showed himself factious and obstructive. He accompanied the prince to Scilly and to Jersey, but on the latter's departure for France went to Holland. At the Restoration he was made a privy councillor and received rewards. He died on the 16th of July 1669, and was buried in Westminster Abbey. According to Clarendon "his affection for the crown was good; his interest and reputation less than anything but his understanding." He married Elizabeth, daughter and co-heir of William, earl of Exeter, by whom he had nine sons and four daughters. Of these Charles succeeded him as 2nd earl of Berkshire; Thomas succeeded the latter; and Philip was ancestor of John, 15th earl of Suffolke and 8th earl of Berkshire, and so of the later earls of Suffolk and Berkshire.

BERKSHIRE [abbreviated Berks, pronounced Berkshire], a southern county of England, bounded N. by Oxfordshire and Buckinghamshire, E. by Surrey, S. by Hampshire, W. by Wiltshire, and N.W. for a short distance by Gloucestershire. Its area is 727 sq. m. Its entire northern boundary is formed by the river Thames, in the basin of which practically the whole county is included. In the north-west a narrow and broken line of hills, piercing in the south-west by the valley of Mortain, which here forms the county boundary, extends past Faringdon and Cumnor, and bears a height over 500 ft. at Cumnor Hurst, which, with Wytham Hill, fills a deep northward bend of the Thames, and overlooks the city of Oxford from the west. The range separates the Thames valley from the Vale of White Horse which is traversed by the small river Ock, and bounded on the south by a line of hills known as the White Horse Hills or Berkshire Downs, richly wooded along their base, and rising sharply to bare rounded summits. In White Horse Hill on the western confines of the county a height of 856 ft. is reached. The line of these hills is continued north-eastward by the Chiltern Hills in Oxfordshire, but a division between the two is made by the Thames in a narrow valley or gap at Goring. Southward the Downs are scored with deep narrow valleys, the chief of which are those of the Lambourn and the Pang. The last stream runs eastward directly to the Thames; but the Lambourn and others join the Kennet, which drains a beautiful sylvan valley to the Thames at Reading. Another of these streams closely confines the vale of Kennet on the south from Newbury upwards, and although the greater part of these does not fall within the county, their highest point, Inkpen Beacon (1011 ft.), does so. The Enborne stream, rising here, and flowing parallel to the Kennet until turning north to join it, is for a considerable distance the county boundary. Between Reading and Windsor the Thames makes a northward bend, past Henley and Marlow, in the form of three sides of a square. Within the bend slight hills border the river, but south of these, and in the Loddon valley south of Reading, the county is low and flat. In the south-east of the county, however, there is a high sandy plateau, forming part of Bagshot Heath, over 400 ft. in elevation, and extending into Surrey. Fir-woods are characteristic of this district, and northward towards the Thames extends the royal park of Windsor, which is magnificently timbered. The proportion to the total area of the county which is under woods is, however, by no means so great as in the adjacent counties of Surrey and Hampshire. There is fine trout-fishing on the Kennet and some of its tributaries.

Geology.—The dominant feature of the county, the Chiltern and White Horse Hills, owes its form to the Chalk, which spreads from Ashbury and Hungerford on the west to Henley and Maidenhead on the east. In the northern face of the escarpment we find the Lower Chalk with a hard bed, the Totternhoe Stone; on the southern slope lies the Chalk-with-Flints. At Kintbury it is quarried for the manufacture of whiting. At the foot of the Chalk escarpment is the Upper Greensand with a narrow crop towards the west which is broken up into patches eastwards. Looking northward from the Chalk hills, the low-lying ground is occupied successively by the Gault Clay, the Kimmeridge Clay, and finally by the Oxford Clay, which extends beyond the Thames into Oxfordshire. This low-lying tract is relieved by an elevated ridge of Corallian beds, between the Kimmeridge Clay and the Gault. It extends from near Faringdon past Abingdon.
to Cumnor and Wytham Hill. At Faringdon there are some interesting gravels of Lower Greensand age, full of the fossil remains of sponges. South of the Chalk the county is occupied by Eocene rocks, mottled clays, well exposed in the brickfields about Reading, and hence called the Reading beds. At Finchampstead, Sunninghill and Ascot these deposits are overlaid by the more sandy beds of the Bagshot series. Between the two last named formations is a broad outcrop of London Clay. Numerous outliers of Eocene rest on the Chalk beyond the main line of boundary. The Chalk of Inkpen Beacon is brought up to the south side of the Tertiary rocks by a synclinal fold; similarly, an anticline has brought up the small patch of Chalk in Windsor Park. Clay-with-Flints lies in patches and holes on the chalk, and flint gravels occur high up on either side of the Thames. Fairly thick beds of peat are found in the alluvium of the Kennet at Newbury.

**Industries.—**About seven-ninths of the total area is under cultivation; a large proportion of this being in permanent pasture, as much attention is paid to dairy-farming. Butter and cheese are largely produced, and the making of condensed milk is a branch of the industry. Many sheep are pastured on the Downs, important sheep-farming being held at the small town of Eton, and Market Isey; and an excellent breed of pigs is named after the county. The parts about Faringdon are specially noted for them. Oats are the principal grain crop; although a considerable acreage is under wheat. Turnips and swedes are largely cultivated, and apples and cherries are grown. Besides the royal castle of Windsor, fine county seats are especially numerous. The only manufacturing centre of first importance is Reading, which is principally famous for its biscuit factories. The manufacture of clothing and carpets is carried on at Abingdon; but a woollen industry introduced into the county as early as the Tudor period is long extinct. Engineering works and paper mills are established at various places; and boat-building is carried on at Reading and other riverside stations. There are extensive seed warehouses and testing grounds near Reading; and the Kennet and Windsor ales are in high repute. Whiting is manufactured from chalk at Kintbury on the Kennet.

**Communications.—**Communications are provided principally by the Thames and the Kennet, the valley of which crosses the country from east to west by Maidenhead, Reading and Didcot. A branch line serves the Kennet valley from Reading; and the northern line of the company leaves the main line at Didcot, a branch from it serving Abingdon. The Basingstoke branch runs south from Reading, and lines serve Wallingford from Cholsey, and Faringdon from Uffington. Communication with the south of England is maintained by a joint line of the South Western and South Eastern & Chatham companies terminating at Reading, and there are branches of the Great Western and South Western systems to Windsor. The Lambourn valley light railway runs north-west to Lambourn from Newbury. Wide water-communications are afforded by the Thames, and the Kennet is in part canalized, to form the eastern portion of the Kennet and Avon canal system, connecting with the Bristol Avon above Bath.

**Population and Administration.—**The area of the ancient county is 462,208 acres; with a population in 1891 of 239,138, and in 1901 of 256,509. The area of the administrative county is 462,567 acres. The county contains twenty hundreds. The main towns are Abingdon, (pop. 6,480), Maidenhead (12,080), Newbury (11,661), Reading, the county town and a county borough (27,217), Wallingford (2808), Windsor or New Windsor (14,130), Wokingham (3551). Wantage (1766) is an urban district. Among lesser towns may be mentioned Faringdon in the north-west (2900), Hungerford on the Kennet (2906), and Lambourn in the valley of that name (2071), the villages of Bray (2928), Cookham (3874) and Tilehurst (2345), which, like others on the banks of the Thames, have grown into residential towns; and Sandhurst (2386). The county is in the Oxford circuit, and assizes are held at Reading. It has one court of quarter sessions, and is divided into twelve petty

**BERKSHIRE**

**sessional divisions.** The boroughs of Abingdon, Newbury, Maidenhead, Reading, Wallingford and Windsor have separate commissions of the peace, and Abingdon, Newbury, Reading and Windsor have separate courts of quarter sessions. There are 198 civil parishes. Berkshire forms an archdeaconry in the diocese of Oxford; a small portion, however, falls within the diocese of Salisbury. There are 202 ecclesiastical parishes or districts, wholly or in part within the county. There are three parliamentary divisions, Northern or Abingdon, Southern or Newbury, and Eastern or Wokingham, each returning one member; while the parliamentary borough of Reading returns one member, and parts of the borough of Oxford and Windsor are included in the county. There are several important educational establishments in the county. Radley College near Abingdon, Wellington College near Sandhurst, and Bradfield College, at the village of that name, 8 m. west of Reading, are among the more important modern public schools for boys. Bradfield College was founded in 1850, and is well known for the realistic performances of classical Greek plays presented by the scholars in an open theatre designed for the purpose. Abingdon and Reading schools rank among the lesser public schools. At Reading is a university extension college, and in the south-east of the county is the Sandhurst Royal Military College.

**History.—**During the Heptarchy Berkshire formed part of the kingdom of Wessex, and interesting relics of Saxon occupation have been discovered in various parts of the county. Of these the most remarkable are the burial grounds at Long Wittenham and Frilford, and there is evidence that the Lambourn valley was occupied in early Saxon times. The cinerary urns found in Berkshire undoubtedly contain the ashes of the Anglians who came south under Penda in the 7th century. The fortification called Cherbury Castle, not far from Denchworth, is said to have been first made up by Canute.

At the time of the Norman invasion Berkshire formed part of the earldom of Harold, and supported him staunchly at the battle of Hastings. This loyalty was punished by very sweeping confiscations, and at the time of the Domesday survey no estates of any importance were in the hands of Englishmen. When Alfred divided the country into shires, this county retained its name of Berroccia, as Angers and from the "wood of Berrocc, where the box-tree grows most plentifully." 1 At the time of the survey it comprised twenty-two hundreds; at the present day there are only twenty, of which eleven retain their ancient names. Many parishes have been transferred from one hundred to another, but the actual boundary of the county is practically unchanged. Part of the parishes of Shilton and Langford formed detached portions of the shire, until included in Oxfordshire in the reign of William IV. Portions of Combe and Shalbourne parishes have also been restored to Hampshire and Wiltshire respectively, while the Wiltshire portion of Hungerford has been transferred to Berkshire. The county was originally included in the see of Winchester, but in A.D. 909 it was removed to the newly-formed see of "Wiltshire," afterwards united with Sherborne. In 1873 the seat of the bishopric was removed to Salisbury, and in 1836 by an order in council Berkshire was transferred to the diocese of Oxford. The archdeaconry is of very early origin and is co-extensive with the county. Formerly it comprised four rural deaneries, but the number has lately been increased to nine. Much of the early history of the county is recorded in the *Chronicles* of the abbey of Abingdon, which at the time of the survey was second only to the crown in the extent and number of its possessions. The abbot also exercised considerable judicial and administrative powers, and his court was endowed with the privileges of the hundred court and was freed from liability to interference by the sheriff. Berkshire and Oxfordshire had a common sheriff until the reign of Elizabeth, and the shire court was held at Granptown. The assizes were formerly held at Reading,

1 The derivation from *Berroccia*, a British tribe in the time of Caesar, which probably inhabited Surrey or Middlesex, seems philologically impossible.
BÉRLAD—BERLINGEN

Abingdon and Newbury, but are now held entirely at Reading. At the time of the Domesday survey the chief lay-proprietor was Henry de Ferrers, ancestor of the earls of Derby, but it is remarkable that none of the great Berkshire estates has remained with the same family long. Thomas Fuller quaintly observes that "the lands of Berkshire are very skittish and apt to cast their owners." The De la Pales succeeded to large estates by a marriage with the heiress of Thomas Chaucer, son of the poet, but the family became extinct in the male line, and the estates were alienated. The same fate befell the estates of the Achards, the Fitzwarren and later the families of Norris and Belis.

The natural advantages of this county have always encouraged agricultural rather than commercial pursuits. The soil is especially adapted for sheep-farming, and numerous documents testify to the importance and prosperity of the wool-trade in the 12th century. At first this trade was confined to the export of the raw material, but the reign of Edward III, saw the introduction of the clothing industry, for which the county afterwards became famous. This trade began to decline in the 17th century, and in 1641 the Berkshire clothiers complained of the deadness of their trade and the difficulty of getting ready money, attributing the same to delay in the execution of justice. The melting industry and the timber trade also flourished in the county until the 19th century. Agriculturally considered, the Vale of the White Horse is especially productive, and Camden speaks of the great crops of barley grown in the district.

Owing to its proximity to London, Berkshire has from early times been the scene of frequent military operations. The earliest recorded historical fact relating to the county is the occupation of the district between Wallingford and Ashbury by Offa in 758. In the 9th and 10th centuries the county was greatly impoverished by the ravages of the Danes, and in 871 the invaders were defeated by Æthelwulf at Englefield and again at Reading. During the disorders of Stephen's reign Wallingford was garrisoned for Matilda and was the scene of the final treaty in 1153. Meetings took place between John and his barons in 1213 at Wallingford and at Reading, and in 1216 Windsor was besieged by the barons. At the opening of the civil war of the 17th century, the sheriff, on behalf of the inhabitants of Berkshire, petitioned that the county might be put in a posture of defence, and here the royalists had some of their strongest garrisons. Reading endured a ten days' siege by the parliamentary forces in 1643, and Wallingford did not surrender until 1646. Newbury was the site of two battles in 1643 and 1644.

In 1255, Berkshire returned two members to parliament for the county and two for the borough of Reading. Later the boroughs of Newbury, Wallingford, Windsor and Abingdon secured representation, and from 1357 until the Reform Act of 1832 the county was represented by a total of ten members. By this act Abingdon and Wallingford were each deprived of a member, but the county returned three members instead of two. Since the Redistribution of Seats Act 1885 the county has returned three members for three divisions, and Windsor and Reading return one member each, the remaining boroughs having lost representation.

Antiquities.—The remains of two great Benedictine monasteries, Abingdon and Reading are scanty. The ecclesiastical architecture of the county is not remarkable, excepting a few individual churches. Thus for Norman work the churches of Shellingley and Cholsey may be noted, together with the very small chapel, of early date, at Upton near Didcot. The church of Bledbury in the same locality is in the main transitional Norman, and retains some of its original vaulting. Of Early English churches there are several good examples, notably at Uffington, with its unusual angular-headed windows, Buckland near Faringdon, and Wantage. The tower of St Helen's, Abingdon, well illustrates this period. The cruciform church of Shottesbrooke, with its central spire, is a beautiful and almost unaltered Decorated building; and St George's chapel in Windsor Castle is a superb specimen of Perpendicular work.

Apart from Windsor, Berkshire retains no remarkable medieval castles or mansions.

AUTHORITIES.—Chief of the older works are: Elias Ashmole, Antiquities of Berkshire (3 vols., 1716, 2nd ed., London, 1723; 3rd ed. Reading, 1756); D. and S. Lysons, Magna Britannia, vol. i. Other works are: Marshall, Topographical and Statistical Details of the County of Berkshire (London, 1830); Earl of Carnarvon, Archaeology of Berkshire (London, 1855); C. King, History of Berkshire (London, 1867); Lomwe, Glossary of Berkshire Word (London, 1888), and Index to Wills in the Court of the Archdeacon of Berkshire, 1508-1652 (Oxford, 1893); Victoria County History, Berkshire. See also The Berks Archaeological Society's Quarterly Journal, and Berkshire Notes and Queries.

BÉRLAD, the capital of the district of Tutoya, Rumania, on the river Bérlad, which waters the high plains of Eastern Moldavia. Pop. (190) 24,484, about one-fourth of whom are Jews. At Bérlad the railway from Jassy diverges, one branch skirting the river Sereth, the other skirting the Pruth; both reunite at Galatz. Among a maze of narrow and winding streets Bérlad possesses a few good modern buildings, including a fine hospital, administered by the St Spiridon Foundation of Jassy. Bérlad has manufactures of soap and candles, and some trade in timber and farm-produce, while the annual horse-fairs are visited by dealers from all parts of the country. In the vicinity are traces of a Roman camp.

BERLINGEN, GOETZ or GOTTFFRID VON (1480-1562), German knight, was born at the castle of Jagsthauzen now in Württemburg, and died in 1562, of the house of Schwalbach, Margrave of Brandenburg-Ansbach, and in 1548 fought for the emperor Maximilian I in Burgundy, Lorraine and Brabant, and next year in Switzerland. About 1500 he raised a company of freelances, and at their head took part in various private wars. In 1505, whilst assisting Albert IV., duke of Bavaria, at the siege of Landshut, his right hand was shot away, and an iron one was substituted which is still shown at Jagsthauzen. In spite of this "Goetz with the iron hand" continued his feats, his motive being mainly booty and ransom. In 1512 a attack near Forchheim on some merchants returning from the great fair at Leipzic, caused him to be put under the ban of the empire by Maximilian, and he was only released from this in 1514 upon a promise to pay 14,000 gulden. In 1516 he made a raid into Hesse and captured Philip IV., count of Waldeick, whom he compelled to pay a ransom of 8,000 gold gulden, and in 1518 was again placed under the ban. He fought for Ulrich I., duke of Württemberg, who was attacked by the Swiss League in 1519, and after a spirited resistance was compelled, through want of ammunition and provisions, to surrender the town of Möckmuhl. In violation of the terms of the capitulation he was held prisoner, and handed over to the citizens of Heilbronn, but owing to the efforts of Sickingen and Georg von Frundsberg was released in 1522, upon paying 20,000 gulden, and swearing not to take vengeance on the League. When the Peasants' War broke out in 1525 Goetz was compelled by the rebels of the Odenwald district to act as their leader. He accepted the position, according to his own account, partly because he had no choice, partly in the hope of curbing the excesses of the insurgents; but, finding himself in this respect powerless, after a month of nominal leadership, he took the first opportunity of escaping to his castle. For his part in the rebellion he was called to account before the diet of Speier, and on the 17th of October 1526 was acquitted by the imperial chamber. In spite of this the Swiss League seized the opportunity of paying off old scores against him. Lured to Augsburg, under promise of safe conduct, to clear himself of the charges made against him on behalf of the League, he was there treacherously seized on the 28th of November 1528, and kept a close prisoner for two years. In 1530 he was liberated on repeating his oath of 1522, and undertaking not to leave the neighbourhood of his castle of Hornberg on the Neckar. He appears to have remained there quietly until 1540 when the emperor Charles V., released him from his oath. In 1542 he fought against the Turks in Hungary, and in 1544 accompanied Charles when he invaded France. He returned to Hornberg, where he passed his time until his death on the 23rd of July 1562. He was twice married and left three daughters and seven
sons. The counts von Berlichingen-Rossach, of Helmstadt near Heidelberg, one of the two surviving branches of the family, are his descendants. The other branch, that of the Freiherrn von Berlichingen-Jagsthausen, is descended from Goetz's brother Hans. "Goetz von Berlichingen" is the title of Goethe's play, which, published in 1773, marked an epoch in the history of German drama (see Goethe).

Goetz's Ausbющее (1773) is the most learned study of the count's life so far published by Pistorius at Nuremberg (1731), and again at Halle (1866).

BERLIN, ISAIAH (1725-1799), an eminent rabbi of Breslau; he was the author of acute notes on the Talmud which had their influence in advancing the critical study of that work.

BERLIN, the largest city of the German empire, the capital of the kingdom of Prussia. It is the principal residence of the German emperor and king of Prussia, the seat of the imperial parliament (Reichstag) and the Prussian diet (Landtag) and of the state offices of the empire, except of the supreme court of justice (Reichsgericht), which is fixed at Leipzig. It lies in a flat, sandy plain, 110 ft. above sea-level, on both banks of the navigable Spree, which intersects it from S.E. to N.W. The highest elevated point is the Kreuzberg (200 ft.), a hill in the southern suburb of Schöneberg, which commands a fine view of the city. The situation of Berlin, midway between the Elbe and the Oder, with which rivers it is connected by a web of waterways, at the crossing of the main roads from Silesia and Poland to the North Sea ports and from Saxony, Bohemia and Thuringia to the Baltic, made it in medieval days a place of considerable commercial importance. In modern times the great network of railways, of which it is the centre and which mainly follow the lines of the old roads, further established its position. Almost equidistant from the remotest frontiers of Prussia, from north to south, and from east to west, 180 m. from Hamburg and 84 from Stettin, its situation, so far from being prejudicial to its growth and prosperity, as was formerly often asserted, has been, in fact, the principal determining factor in its rapid rise to the position of the greatest industrial and commercial city on the continent of Europe. In point of wealth and population it ranks immediately after London and Paris. The area of the city has not been essentially extended since 1860, and though large and important suburbs have kept up and practically merged with it, its administrative area remains unchanged. It occupies about 29 sq. m., and has a length from E. to W. of 6 and a breadth from N. to S. of 55 m., contains nearly 1000 streets, has 87 squares and open spaces, 73 bridges and a population (1905) of 2,033,900 (including a garrison of about 22,000). If, however, the outer police district, known as "Greater Berlin," embracing an area of about 10 m. radius from the centre, be included, the population amounts to about 3½ millions.

Berlin is essentially a modern city, the quaint two-storyed houses, which formerly characterized it, having given place to palatial business blocks, which somewhat dwarf the streets and squares, which once had an air of stately spaciousness. The bustle of the modern commercial city has superseded the austere dignity of the old Prussian capital. Thus the stranger entering it for the first time will find little to remind him of its past history. The oldest part of Berlin, the city and Alt-Köln, built along the arms of the Spree, is, together with that portion of the town lying immediately west, the centre of business activity. The west end and the south-west are the residential quarters, the north-west is largely occupied by academical scientific and military institutions, the north is the seat of machinery works, the north-east of the woolen manufactories, the east and south-east of the dyeing, furniture and metal industries, while in the south are great barracks and railway works.

In 1870 Berlin was practically bounded on the south by the Landwehr Canal, but it has since extended far beyond, and the Tempelhofer Feld, where military reviews are held, then practically in the country, is now surrounded by a dense belt of houses. The Landwehr Canal, leaving the Spree near the Schlesische Tor (gate), and rejoining it at Charlottenburg, after a course of 6 m., adds not a little to the charm of the southern and western districts, being flanked by fine boulevards and crossed by many handsome bridges. The object of this canal was to relieve the congestion of the water traffic in the heart of Berlin. It was superseded, however, in its turn by a new broad and deep canal opened in 1906, lying from 3 to 4 m. farther south. This, the Teltow Canal, leaves the Spree above Berlin at Köpenick, and running south of Rixdorf, Süden and Gross-Lichterfelde, enters the Havel at Teltow. This important engineering work was planned not only to afford a more convenient waterway between the upper Spree and the Havel (and thus to the Elbe), but was to remove from the city to its banks and vicinity those factories of which the noxious gases and other poisonous emanations were regarded as dangerous to the health of the community. A dislocation of the manufacturing factors has therefore been in progress, which with the creation of a "trans Tiberim" (as in ancient Rome) is, in many respects, altering the character and aspect of the metropolis.

The effect upon Berlin of the successful issue of the Franco-Prussian War of 1870-1871 was electrical. The old Prussian capital girdled itself at once to fulfil its new role, the concentration upon the city of a large garrison flushed with victory, and eager to emulate the vanquished foe in works of peace, and vie with them in luxury, was an incentive to Berliners to put forth all their energy. Besides the military, a tremendous immigration of civilian officials took place as the result of the new conditions, and, as accommodation was not readily available, rents rose to an enormous figure. Doubts were often expressed whether the capital would be able to bear the burden of empire, so enormous was the influx of new citizens. It is due to the magnificent services of the municipal council that the city was enabled to assimilate the hosts of newcomers, and it is to its indefatigable exertions that Berlin has in point of organization become the model city of Europe. In no other has public money been expended with such enlightened discretion, and in no other has the municipal system kept pace with such rapid growth and displayed greater resource in emergencies. In 1870 the sanitary conditions of Berlin were the worst of any city of Europe. It needed a Virchow to open the eyes of the people to the terrible waste of life such a state of things entailed. But open sewers, rubbish-strewn paard roads, open market-places and overcrowded subterranean dwellings are now abolished. The city is excellently drained, well-paved, well-lighted and furnished with an abundant supply of filtered water, while the cellars have given place to light and airy tenements, and Berlin justly claims to rank among the cleanest and healthiest capitals in Europe. The year 1878 marks a fresh starting-point in the development of the city. In that year Berlin was the meeting-place of the congress which bears its name. The recognition of Germany as a leading factor in the world's councils had been given, and the people of Berlin could indulge in the task of embellishing the capital in a manner befitting its position. From this time forward, state, municipal and private enterprise have worked hand in hand to make the capital cosmopolitan. The position it has at length attained is due not alone to the enterprise of its citizens and the municipality. The brilliancy of the court and the triumph of the sense of unity in the German nation over the particularism of the smaller German states have conduced more than all else to bringing about this result. It has become the chief pleasure town of Germany; and though the standard of morality, owing to the enormous influx of people bent on amusement, has become lower, yet there is so much healthy, strenuous activity in intellectual life and commercial rivalry as to entitle it, despite many moral deficiencies, to be regarded as the centre of life and learning in Germany. Dr A. Shadwell (Industrial Efficiency, London, 1906) describes it as representing "the most complete application of science, order and method of public life," adding
BERLIN

"it is a marvel of civic administration, the most modern and most perfectly organized city that there is."

Stress.—The social and official life of the capital centres round Unter den Linden, which runs from the royal palace to the Brandenburger Tor. This street, one of the finest and most spacious in Europe, nearby a mile in length, its double avenue divided by a favourite promenade, planted with lime trees, presents Berlin life in all its varying aspects. Many historical events have taken place in this famous boulevard, notably the entry of the troops in 1871, and the funeral pageant of the emperor William I. South of Unter den Linden lies the Friedrichstadt, with its parallel lines of straight streets, including the Behren-strasse,—the seat of finance,—the Wilhelmstrasse, with the palace of the imperial chancellor, the British embassy, and many government offices,—the official quarter of the capital,—and the busy Leipziger-strasse, running from the Potsdamer-platz to the Döhnhoff-platz. This great artery and Unter den Linden are crossed at right angles by the Friedrichstrasse, 2 m. long, flanked by attractive shops and restaurants, among them the beer palaces of the great breweries. In the city proper, the König-strasse and the Kaiser-Wilhelm-strasse, the latter a continuation of Unter den Linden, off the chief street, are the fashionable south-west quarter Viktoria-strasse, Bellevue-strasse, Potsdamer-strasse and Kurfürstendamm are the most imposing. Among the most important public squares are the Opern-platz, around or near which stand the opera house, the royal library, the university and the armory; the Gendarmenmarkt, with the royal theatre in its centre, the Schloss-platz, the Lustgarten, between the north side of the royal palace, the cathedral and the old and new museums; the Pariser-platz with the French embassy, at the Brandenburg Gate; the Königs-platz, with the column of Victory, the Reichstagsgebäude and the Bismarck and Moltke monuments; the Wilhelms-platz; the circular Belle-Alliance-platz, with a column commemorating the battle of Waterloo; and, in the western district, the spacious Lützow-platz.

Bridges.—Of the numerous bridges, the most remarkable are the Schloss-brücke, built after designs by Schinkel in 1822–1824, with eight colossal figures of white marble, representing ideal stages in a warrior's life, the work of the sculptors Calboff and other names; the Kurfürst- or Lange-brücke, built 1802–1805, and restored in 1855, with an equestrian statue of the great elector, and the Kaiser-Wilhelm-brücke (1886–1889) connecting the Lustgarten with the Kaiser-Wilhelm-strasse in the inner town. In the modern residential quarter are the Potsdamer-Viktoria-brücke, which carries the traffic from two converging streets into the outer Potsdamer-strasse, and the Herkules-brücke connecting the Lützow-platz with the Tiergarten. The first three cross the Spree and the last two the Landwehr Canal.

Churches.—Berlin, until the last half of the 19th century, was in respect of its churches probably the poorest of the capitals of Christendom, and the number of worshippers on an average Sunday was then less than 2% of the population. The city now contains over a hundred places of worship, of which ten are Roman Catholic, and nine Jewish synagogues. Of the older Evangelical churches but four date from medieval days, and of them only the Marien-kirche, with a tomb of Field marshal O. C. von Sparr (1655–1663), and the Nikolait-kirche are particularly noteworthy. Of a later date, though of no great pretensions to architectural merit, are the Petrî-kirche with a lofty spire, the Französische-kirche and the Neue-kirche with dome-capped towers, on the Gendarmen-markt, and the round, Roman Catholic St Hedwig-kirche behind the Opera-house. The Garrison church in the centre of the city, which was erected in 1772 and contained numerous historical trophies, was destroyed by fire in 1908. Of modern erections the central cathedral (Dom), on the Spree, which replaces the old building pulled down in 1803, stands first. It is a clumsy, though somewhat imposing edifice of sandstone in Italian Renaissance style, and has a dome rising, with the lantern, to a height of 380 ft. The Kaiser-Wilhelm-Gedächtnis-kirche (in the suburb Charlottenburg) with a lofty spire, the Dankes-kirche (in commemoration of the emperor William I's escape from the band of the assassin, Nobiling, in 1878) in Wedding, and the Kaiser-Friedrich-Gedächtnis-kirche on a grassy knoll in the north of the Tiergarten are also worthy of notice. In the Monbijou Park, on the north bank of the Spree, is the pretty English church of St George. The main Jewish synagogue, a fine building in oriental style, erected in 1866, stands in a commanding position in the Oranienburger-strasse and is remarkable for its stained glass. Berlin was a walled city until 1867–1868. Of the former nineteen city gates only one remains, the Brandenburg Gate (1789–1793), an imitation of the Propylaea at Athens. It is 201 ft. broad and nearly 65 ft. high, and is supported by twelve Doric columns, each 44 ft. in height, and surmounted by a car of victory (Auriga), which, taken by Napoleon to Paris in 1807, was brought back by the Prussians in 1814. The gate has been enlarged by two lateral colonnades, each supported by sixteen columns.

Public Buildings.—In secular buildings Berlin is very rich. Entering the city at the Potsdam Gate, traversing a few hundred yards of the Wilhelms-strasse, turning into Wilhelmstrasse, and following it to Unter den Linden, then beginning at the Brandenburg Gate and proceeding down Unter den Linden to its end, one passes, among other buildings, the following, many of them of great architectural merit—the admiralty, the ministry of commerce, the ministry of war, the ministry of public works, the palace of Prince Frederick Leopold, the palace of the imperial chancellor, the foreign office, the ministry of justice, the residences of the ministers of the interior and of public worship, the French and the Russian embassies, the arcade, the palace of the emperor William I., the university, the royal library, the opera, the armory, the palace of the emperor Frederick III., the Schloss-brücke, the royal park, the old and new museums and the national gallery. At a short distance from this line, on the new-town hall, the mint, the imperial bank and the royal theatre. Berlin differs from all other great capitals in this respect that with the exception of the royal palace, which dates from the 16th century, all its public buildings are modern. This place, standing in the very heart of the city, is a huge quadrangular building, with four courts, and is surmounted by a dome 210 ft. high, and is built in the Romanesque style. The principal courts are the stalls and the latter the Weisse-saal used for great court pageants, the halls of the chapters of the Black and the Red Eagle orders, a picture gallery and a chapel. The first floor overlooking the Schloss-platz is the Berlin residence of the emperor, and that square is embellished by a huge fountain (Neptunis-brunnen) by R. Begas. Facing the west portal is the monument to the emperor William II., and before the north gate, opening upon the Lustgarten, are the famous bronze groups, the "horse-tamers" by Clodt, the gift of the emperor Nicholas I. of Russia. The establishment of the imperial government in Berlin naturally brought with it the creation of a large number of public buildings, and the great prosperity of the country, as well as the enhanced national feeling, has enabled them to be built on a scale of splendour befitting the capital of an empire. First in importance is the Reichstagsgebäude (see Architecture, plate i., fig. 47), in which the federal council (Bundesrat) and the imperial parliament (Reichstag) hold their sittings. A special feature is the library, which is exceedingly rich in works on constitutional law. A new house has also been built for the Prussian parliament (Landtag) in the Albrecht-strasse. Other new official buildings are the patent office on the site of the old ministry of the interior; the new ministry of posts (with post museum) at the corner of the Mauer-strasse and Leipziger-strasse; the central criminal court in Moabit; the courts of first instance on the Alexander-platz; the ministry of police, and the Reichsversicherungssamt, the centre for the great system of state insurance. In addition to these, many buildings have been restored and enlarged, chief among them being the armory (Zeughaus), the war office and the ministry of public works, while the royal mews (Marshall) has been entirely rebuilt with an imposing façade.
Among the public monuments comes first, in excellence, Rauch's celebrated statue of Frederick the Great, which stands in Unter den Linden opposite the palace of the emperor William I; and in size the monument to the emperor William I. (by R. Begas), erected opposite the west portal of the royal palace. The space for the site was gained by pulling down the old houses composing the Schlossfreiheit and damming the Spree. The monument, which cost £200,000, is surmounted by an equestrian statue of the emperor in a martial cloak, his right hand resting on a field marshal's baton, reining in his charger, which is led by a female genius of peace. The high pedestal on which these figures stand is surrounded by an Ionic colonnade. The equestrian statue of the great elector on the Lange-brücke has been already mentioned. In the Lustgarten is a statue of Frederick William III, by Wolff; in the Tiergarten, Drake's marble monument to the same ruler; and in the mausoleum in the park in Charlottenburg he and his queen, Louisa, are sculptured in marble by Rauch. Here also lie the emperor William I. and the empress Augusta under marble effigies by Encke. A second group of monuments on the Wilhelms-platz commemorates the generals of the Seven Years' War; and a third in the neighbourhood of the Museum is a monument of French forty-two by Rauch, erected in 1871. On the Kreuzberg a Gothic monument in bronze was erected by Frederick William III. to commemorate the victories of 1813-1815; and in the centre of the Königs-platz stands a lofty column in honour of the triumphs of 1864, 1866 and 1870-1871, surmounted by a gilded figure of Victory. Literature, science and art are represented in different parts of the city by statues and busts of Rauch, Schinkel, Thaer, Böckh, Schadow, Winckelmann, Schiller, Hegel and Jahn. On the Königs-platz between the column of Victory and the Reichstagsgebäude, and immediately facing the western façade of the latter, is the bronze statue of Bismarck, unveiled in 1901, a figure 20 ft. in height standing on a granite base. From the south side of the Königs-platz crossing the Tiergarten and intersecting the avenue from the Brandenburg Gate to Charlottenburg runs the broad Sieges-allee adorned by thirty-two groups of marble statuary representing famous rulers of the house of Hohenzollern, the gift of the emperor William II. to the city. The Tiergarten, the beautiful west-end park with its thickets of dense undergrowth and elaborated walks and lakes, has lost something of its former glory owing to building improvements on the north side and the laying out of new rides and drives. It has, in addition to those above enumerated, statues of Queen Louisa, Goethe and Lessing.

Communications.—Berlin is the centre of the North German network of railways. No fewer than twelve main lines concentrate upon it. Internal communication is provided for by the Ringbahn, or outer circle, which was opened in 1871, and by a well-devised system connects the termini of the various main lines. The through traffic coming from east and west is carried by the Stadtbahn, or city railway, which also connects with and forms an integral part of the outer circle. This line runs through the heart of the city, and was originally a private enterprise. Owning, however, to the failure of the company, the work was taken in hand by the state, and the line opened in 1878. It has four tracks—two for the main-line through traffic, and two for local and suburban service, and is carried at a height of about 20 ft. above the streets. Its length is 12 m., the total cost £3,000,000. The chief stations are Zoologischer Garten, Friedrich-strasse, Alexander-platz and Schlesisches Bahnhof. Lying apart from the system are the Lehrer-Bahnhof for Hamburg and Bremen, the Stettiner for Baltic ports, and the Görlitz, Anhalter and Potsdam termini for traffic to the south, of which the last two are fine specimens of railway architecture. Internal communication is also provided for by a excellent system of electric tram-lines, by an overhead electric railway running from the Zoologischer Garten to the Schlesische Tor with a branch to the Potsdam railway station, and by an underground railway laid at a shallow depth under the Leipziger-strasse. Most of the cars (victorias and broughams) have fare-indicators. Steamboats ply above and below the city.

Industry, Trade and Commerce.—It is in respect of its manufacture and trade that Berlin has attained its present high pitch of economic prosperity. More than 50% of its working population are engaged in industry, which embraces almost all branches, of which new ones have lately sprung into existence, whilst most of the older have taken a new lease of life. The old wool industry, for example, has become much extended, and now embraces products such as shawls, carpets, hosey, &c. Its silk manufactures, formerly so important, have, however, gradually gone back. It is particularly in the working of iron, steel and cloth, and in the by-products of these, that Berlin excels. The manufacture of machinery and steam-engines shows an enormous development. No fewer than 100 large firms, many of them of world-wide reputation, are engaged in this branch alone. Among the chief articles of manufacture and production are railway plant, sewing machines, bicycles, steel pens, chronometers, electric and electric-telephone plant, bronze, chemicals, soap, lamps, linoleum, china, pianofortes, furniture, gloves, buttons, artificial flowers and ladies' mantles, the last of an annual value exceeding £5,000,000. It has extensive breweries and vies in the amount of the output of this product with Munich and Augsburg. The centre of the chief market for speculation in corn and other cereals is believed to be reached by water from Poland, Austria and South Russia, while in commerce in spirits it rivals Hamburg. It is also a large publishing centre, and has become a serious rival to Leipzig in this regard.

The Börse, where 40,000 persons daily do business, is the chief market in Germany for stocks and shares, and its dealings are of great influence upon the gold market of the world. Numerous banks of world-wide reputation, doing an extensive international business, have their seats in Berlin, chief among them, in addition to the Reichsbank, being the Berliner Kassen-Verein, the Diskontogesellschaft, the Deutsche Bank, and the Boden-Kredit Bank.

Learning and Art.—Berlin is becoming the centre of the intellectual life of the nation. The Friedrich Wilhelm University, although young in point of foundation, has long outstripped its great rival Leipzig in numbers, and can point with pride to the fact that its teaching staff has yielded to none in the number of illustrious names. It was founded in 1810, when Prussia had lost her celebrated university of Halle, which Napoleon had invested in his hands. The first German University. It was at first a war of war, as well as a nursery of learning, that Frederick William III. and the great men who are associated with its origin, called it into existence. Wilhelm von Humboldt was at that time at the head of the educational department of the kingdom, and men like Fichte and Schleiermacher worked on the popular mind. The first ten years of its existence it counted among its professors such names as Neander, Savigny, Eichhorn, Böckh, Bekker, Hegel, Raumer, Niebuhr and Buttman. Later followed men like Hengstenberg, Homeyer, Bethmann-Hollweg, Puchta, Stahl and Heffter; Schelling, Trendelenburg, Bopp, the brothers Grimm, Zumpt, Carl Richter; later still, Twesten and Dorner, Gneist and Hinschius; Langenbeck, Bardeleben, Virchow, Du-Bois Reymond; von Ranke, Curtius, Lipsius, Hofmann the chemist, Kiepert the geographer, Helmholtz, van't Hoff, Koch, E. Fischer, Waldeyer and von Bergmann among scientists and surgeons; Mommsen, Treitschke and Sybel among historians; Harnack among theologians, Brummer among jurists. Taking ordinary, honorary, extraordinary professors and licensed lecturers (Privat-dozenten) together, its professorial strength consisted, in 1904-1905, of 23 teachers in the faculty of theology, 32 in that of law, 175 in that of medicine and 237 in that of philosophy—altogether 457. The number of matriculated students during the same period was 71,54, as against 54,88 in the preceding summer term. The number of matriculated students is usually greater in winter than in summer; the reason of the disproportion being that in the summer university towns having pleasant surroundings, such as Bonn, Heidelberg, Kiel and Jena, are more frequent. Berlin is essentially a Prussian university—of students from non-German states, Russia sends most, then the United States of America, while Great Britain is credited with comparatively
few. It is, however, in the ugly palace of Prince Henry of Prussia, which was given for the purpose in the days of Prussian poverty and distress, that the university is still housed, and although some internal rearrangement has been effected, no substantial alterations have been made to meet the ever-increasing demand for lecture-room accommodation. The garden towards Unter den Linden is adorned by a bronze statue of Helmoltz; the marble statues of Wilhelm and Alexander von Humboldt, which were formerly placed on either side of the gate, have been removed to the adjacent garden. Technical education is provided in the magnificent buildings erected at a cost of £100,000 in Charlottenburg, which are equipped with all the apparatus for the teaching of science. Among other institutions of university rank and affiliated to it are the school of mines, the agricultural college, the veterinary college, the new seminary for oriental languages, and the high school for music. The geodetic institute has been removed to Potsdam. The university is, moreover, rich in institutions for the promotion of medical and chemical science, for the most part housed in buildings belonging to the governing body. There should also be mentioned the Royal Academy of Sciences, founded in 1700. The name of Leibnitz is associated with its foundation, and it was raised to the rank of a royal academy by Frederick the Great in 1743. The Royal Academy of Arts is under the immediate protection of the king, and is governed by a director and senate. There is also an academy of vocal music.

Schools.—Berlin possesses fifteen Gymnasien (classical schools, for the highest branches of the learned professions), of which four are under the direct supervision of the provincial authorities and have the prefix königlich (royal), while the remaining eleven are municipal and under the control of the civic authorities. They are attended by about 7000 scholars, of whom a fourth are Jews. There are also eight Real-gymnasien (or “modern” schools), numerous Real-schulen (commercial schools), public high schools for girls, and commodious and excellently organized elementary schools.

Museums.—The buildings of the royal museum are divided into the old and new museums. The former is an imposing edifice situated on the north-east side of the Lustgarten, facing the royal palace. It was built in the reign of Frederick William III. from designs by Schinkel. Its portico supported by eighteen colossal Ionic columns is reached by a wide flight of steps. The back and side walls of the portico are covered with frescoes, from designs by Schinkel, representing the world’s progress from chaos to organic and developed life. The sides of the flight of steps support equestrian bronze groups of the Amazon by Kiss, and the Lion-slayer by Albert Wolff. Under the portico are monuments of the sculptors Rauch and Schadow, the architect Schinkel, and the art critic Winckelmann. The interior consists of a souterrain, and of a first floor, entered from the portico through bronze doors, after designs by Stüler, weighing 7½ tons, and executed at a cost of £7500. This floor consists of a rotunda, and of halls and cabinets of sculpture. The second floor, which formerly contained the national gallery of paintings, is occupied by a collection of northern antiquities and by the Schillerische treuhälder.

The new museum, connected with the old museum by a covered corridor, is, in its internal arrangements and decorations, one of the finest structures in the capital. The lowest of its three floors contains the Egyptian museum; on the first floor plaster casts of ancient, medieval and modern sculpture are found, while the second contains a cabinet of engravings. On the walls of the grand marble staircase, which rises to the full height of the building, Kaulbach’s cyclus of stereochromatic pictures is painted, representing the six great epochs of human progress, from the confusion of tongues at the Tower of Babel and the dispersion of the nations to the Reformation. The royal museum is surrounded by a Corinthian colonnade and lying between the royal museums and the Spree, contains a number of modern German paintings. Behind these buildings, again, is the Pergamum museum, which houses a unique collection, the result of the excavations at Pergamum. Still farther away, on a triangular plot of land enclosed by the two arms of the Spree and the metropolitan railway, stands the Kaiser Friedrich museum (1904). This edifice, in the Italian baroque style, surmounted by a dome, possesses but little architectural merit, and its position is so confused that great ingenuity had to be employed in its internal arrangements to meet the demands of space, but its collection of pictures is one of the finest in Europe. Hither were removed, from the old and new museums, the national gallery of pictures, the statuary of the Christian epoch and the numismatic collection. The gallery of paintings, on the first floor, is distributed into the separate schools of Germany, Italy, Flanders and Holland, while another of the central rooms embraces those of Spain, France and England. The collection, which in 1874 contained 1300 paintings, was then enriched by the purchase of the Prussian government for £50,000 of the Suermondt collection which, rich in pictures of the Dutch and Flemish schools, contained also a few by Spanish, Italian and French masters. The gallery as a whole has been happily arranged, and there are few great painters of whom it does not contain one or more examplos. The Kunst-gewerbliche museum, at the corner of the Königstrasse, is an open-air museum, and is connected with the palace by a long colonnaded passage, and the Albrecht-strasse, contains valuable specimens of applied art.

Theatres.—In nothing has the importance of Berlin become more conspicuous than in theatrical affairs. In addition to the old-established Opernhaus and Schauspielhaus, which are supported by the state, numerous private playhouses have been erected, notably the Lessing and the Deutsches theatres, and it is in these that the modern works by Wildenbruch, Sudermann, and Hauptmann have been produced, and it may be said that it is in Berlin that the modern school of German drama has its home. In music Berlin is not able to vie with Leipzig, Dresden or Munich, yet it is well represented by the Conservatorium, with which the name of Joachim is connected, while the modern school is represented by Xavier Scharwenka.

Government, Administration and Politics.—On the 1st of April 1881 Berlin was divided off from the province of Brandenburg and since forms a separate administrative district. But the chief presidency (Oberpräsidentium), the Consistory, the provincial school-board, and the board of health of the province of Brandenburg remain tribunals of last instance to which appeals lie from Berlin. The government is partly semi-military (police) and partly municipal. The ministry of police (a branch of the home office) consists of six departments: (1) general; (2) trade; (3) building; (4) criminal; (5) passports; (6) markets. It controls the fire brigade, has the general inspection over all strangers, and is responsible for public order. The civil authority (Magistrat) consists of a chief mayor (Oberbürgermeister), a mayor (Bürgermeister), and a city council (Stadtrat). The Obeibürgermeister, who is ex officio a member of the Prussian Upper House, and the Bürgermeister are elected by the common council (Stadtverordnetenversammlung) of 144 members, i.e., three delegates chosen by manhood suffrage for each ward of the city; but the election is subject to the veto of the king without reason given. The Stadtrat consists of 32 members, of whom 15 are paid officials (including 2 syndics, 2 councillors for building, and 2 for education), while 17 serve gratuitously. For general work the Magistrat and the Stadtverordnetenversammlung coalesce, and committees are appointed for various purposes out of the whole body, these being usually presided over by members of the Magistrat. Their jurisdiction extends to water-supply, the drainage, lighting and cleaning of the streets, the care of the poor, hospitals and schools. Politically the city is divided into six Reichstag and four Landtag constituencies, returning six and nine members respectively, and it must be noted that in the case of the Landtag the allocation of seats dated from 1860, so that the city, in proportion to its population, is under-represented. It should have had twenty-five members instead of nine.

Population.—The stupendous growth of the population of Berlin during the last century is best illustrated by the following figures. In 1816 it contained 197,717 inhabitants; in 1849,
789

Employed Only respect streets, and charity system have controlled, with the tramway quite Forst, other Hospitals.

Hospitals.—In no other city of the world is the hospital organization so well appointed as in Berlin, or are the sick poor tended with greater solicitude. State, municipal and private charity here again join hands in the prompt relief of sickness and cases of urgency. The municipal hospitals are six in number, the largest of which is the Virchow hospital, situate in Moabit and opened in 1906. It is arranged on the pavilion system, contains 2000 beds, and is one of the most splendidly equipped hospitals in the world. The cost amounted to £600,000. Next comes that of Friedrichshain, also built on the pavilion system, while the state controls six (not including the prison infirmary) of which the world-renowned Charité in the Luisen-strasse is the principal. The hospitals of the nursing sisters (Dianonischen Anstalten) number 8, while there are 60 registered private hospitals under the superintendence of responsible doctors and under the inspection of government.

Charities.—Berlin is also very richly endowed with charitable institutions for the relief of pauperism and distress. In addition to the municipal support cut third, the privileges there are large funds derived from bequests for the relief of the necessitous and deserving poor; while night shelters and people's kitchens have been organized on an extensive scale for the temporary relief of the indigent unemployed. For the former several of the arches of the city railway have been utilized, and correspond in internal arrangement to like shelters instituted by the Salvation Army in London and various other cities.

Markets.—Open market-places in Berlin are things of the past, and their place has been taken by airy and commodious market halls. Of these, 14 in number, the central market, close to the Alexander-platz station of the city railway with which it is connected by an admirable service of lifts for the rapid unloading of goods, is the finest. It has a ground area of about 17,000 sq. yds., and is fitted with more than 2000 stalls. The other markets are conveniently situated at various accessible places within the city, and the careful police supervision to which they are subjected, both in the matter of general cleanliness, and in the careful examination of all articles of food exposed for sale, has led to the general good repute of the population.

The central cattle market and slaughter-houses for the inspection and supply of the fresh meat consumed in the metropolis occupy an extensive area in the north-east of the city on the Ringbahn, upon which a station has been erected for the accommodation of meat trains and passengers attending the market. The inspection is rigorously carried out, and only carcasses which have been stamped as having been certified good are permitted to be taken away for human consumption.

History.—The etymology of the word "Berlin" is doubtful. Some derive it from Celtic roots—ber, small, short, and lyn, a lake; others regard it as a Wend word, meaning a free, open place; others, again, refer it to the word werl, a river island. Another authority derives it from the German word Brühl, a marshy district, and the Slavonic termination in; thus Brühl, by the regular transmutation Bühn, (compare Ger. bruen- and Eng. burn), Bührlin. More recent research, however, seems to have established the derivation from Werh, dam.

Similar obscurity rests on the origin of the city. The hypotheses which carried it back to the early years of the Christian era have been wholly abandoned. Even the margrave Albert the Bear (d. 1170) is no longer unquestionably regarded as its founder, and the tendency of opinion now is to date its origin from the time of his great-grandsons, Otto III. and John I. When first alluded to, what is now Berlin was spoken of as two towns, Kölln and Berlin. The first authentic document concerning the former is from the year 1237, concerning the latter from the year 1444, and it is with these dates that the trustworthy history of the city begins. In 1307 the first attempt was made to combine the councils of Kölln and Berlin, but the experiment was abandoned four years later, and the two towns continued their separate existence till 1432, when the establishment of a common council for both led to disturbances of which the outcome was that Frederick II., the Iron in 1442 abolished this body, and restored each town to its former status, and began the building of a castle at Kölln. A feud between the elector and the Berliners ended in the defeat of the latter, who in 1448 were forced to accept the constitution of 1442. From this time Berlin became and continued to be the residence of the Hohenzollerns, the elector John Cicero (1486-1499) being the first to establish a permanent court inside the walls. It was not, however, until the time of King Frederick William I. that the sovereign ceased to date their official acts from Kölln. In 1539, under the elector Joachim II., Berlin embraced the Lutheran religion. Henceforth the history of Berlin was intimately bound up with the house of Hohenzollern. The conversion of the elector John Sigismund in 1613 to the Reformed (Calvinist) faith was hotly resented by the Berliners and led to bloody riots in the city. The Thirty Years' War all but ruined the city, the population of which sank from some 14,000 in 1600 to less than 8000 in 1630. It was restored and the foundations of its modern
splendour were laid by the Great Elector, by the time of whose death (1688) the population had risen to some 20,000. During this period several suburbs had begun to grow up, Friedrichswerder in 1659 and the Dorotheenstadt, so named in 1676 after the electress Dorothea its founder. In 1688 Frederick III. (afterwards King Frederick I.) began the Friedrichstadt, completed by Frederick William I. Under Frederick I., who did much to embellish the city as the royal Residenstadt, the separate administrations of the quarters of Berlin, Kölln, Friedrichstadt, Friedrichswerder and Dorotheenstadt were combined, and the separate names were absorbed in that of Berlin. The fortifications begun in 1658 were finally demolished under Frederick the Great in 1745, and the Neue Friedensstrasse, the Alexander-strasse and the Wall-strasse were laid out on their site.

Twice during the Seven Years' War Berlin was attacked by the enemy: in 1757 by the Austrians, who penetrated into the suburbs and levied a heavy contribution, and in 1760 by the Russians, who bombarded the city, penetrated into it, and only retired on payment of a ransom of 1,500,000 thalers (£23,000). After the disastrous campaign of Jena, Berlin suffered much during the French occupation (24th October 1806 to 1st December 1807). Solitude and desolation followed, however, the progress of the city was steady. In 1809 the present municipal government was instituted. In 1810 the university was founded. After the alliance of Prussia and Russia in 1812 Berlin was again occupied by the French, but in March 1813 they were finally driven out. The period following the close of the war saw great activity in building, especially in the erection of many noble monuments and public buildings, e.g. those by the architect Karl Friedrich Schinkel. The most notable event in the history of Berlin during the 19th century, prior to the Franco-German War, was the March revolution of 1848 (see Germany: History, and Frederick William IV., king of Prussia). The effect of the war of 1870-71 on the growth of Berlin has been sufficiently indicated already.

Authorities.—For the history of Berlin see the publications of the Verein für die Geschichte der Berliner, the Berlinische Chronik, Berliner Urkundenb., and the periodicals Der Bär (1875, &c.) and Mitteilungen (1884, &c.). Of histories may be mentioned A. Strecker, 500 Jahre Berlins Geschichte (new ed. by Fernbach, 1900); Berlin im 19. Jahrhundert (4 vols., 1867-1869), and Statistisches Jahrbuch für die Stadt Berlin (1894-1926); F. Schinkel, Historische und statistische Beiträge zur Geschichte der Stadt Berlin (5 vols., 1837-1842): Brockhaus, Konversations-Lexikon (1904); Meyer, Konversations-Lexikon (1894); Badeker, Fahrer durch Berlin; Woel, Fahrer durch die Stadt Berlin; Tom. Berlin (1816-1900); A. E. Ivanov, Industrial Efficiency (London, 1906); Berliner Jahrbuch für Handel und Industrie (1905); and O. Schwebel, Geschichte der Stadt Berlin (Berlin, 1888).

Berlin, Congress and Treaty of. The events that led up to the assembling of the congress of Berlin, the outcome of which was the treaty of the 13th of July 1878, are described elsewhere (see Europe: History; Turkey: History; Russo-Turkish War). It must suffice to say that the terms of the treaty of San Stefano (3rd March 1878), by which the Russo-Turkish War had been brought to a conclusion, seemed to those of the other powers who were most interested scarcely less fatal to the Ottoman dominion than that Russian occupation of Constantinople which Great Britain and France were disposed to match. By the new treaty of San Stefano Bulgaria was to become a practically independent state, under the nominal suzerainty of the sultan, bounded by the Danube, the Black Sea, the Aegean and the Albanian, and cutting off the latter from the remnant of Rumelia which, with Constantinople, was to be left to the Turks. At the same time the other Christian principalities, Servia and Montenegro, were largely increased in size and their independence definitively recognized; and the proposals of the powers with regard to Russia and Germany, communicated to the Ottoman plenipotentiaries at the first sitting of the conference of Constantinople (23rd December 1876), were to be immediately executed. These provisions seemed to make Russia permanently arbiter of the fate of the Balkan peninsula, the more so since the vast war indemnity of 1,400,000,000 roubles exacted in the treaty promised to cripple the resources of the Ottoman government for years to come.

The two powers whose interests were most immediately threatened by the terms of the peace were Austria and Great Britain. The former especially, refusing to be bribed by the Russian offer of Bosnia and Herzegovina, saw herself cut off from all chance of expansion in the Balkan peninsula and threatened with the establishment there of the paramount power of Russia, a peril it had been her traditional policy to avert. On the 5th of February, accordingly, Count Andrassy issued a circular note, addressed to the signatory powers of the treaty of Paris of 1856 and the London protocol of 1871, suggesting a congress for the purpose of establishing "the agreement of Europe on the modifications which it may become necessary to introduce into the above-mentioned treaties" in view of the preliminaries of peace signed by Russia and Turkey. This appeal to the sanctity of international engagements, traditional in the diplomatic armoury of Austria, and strengthened by so recent a precedent as that of 1867, met with an immediate response. On the 1st of April Lord Salisbury had already addressed a circular note to the British embassies refusing on behalf of the British government to recognize any arrangements made in the peace preliminaries, calculated to modify European treaties, "unless they were made the subject of a formal agreement among the parties to the treaty of Paris," and quoting the "essential principle of the law of nations" promulgated in the London protocol. By Great Britain therefore the Austrian proposal was at once accepted. Germany was very willing to fall in with the views of her Austrian ally and share in a council in which, having no immediate interests of her own, Bismarck could win new laurels in his rôle of "honest broker." In these circumstances Russia could not but accept the principle of a congress. She tried, however, to limit the scope of its powers by suggesting the exclusion of certain clauses of the treaty from its reference, and pointed out (circular of Prince Gorchakov, April 9th) that Russia had not been the first nor the only Power to violate the treaties in question. The answer of Lord Beaconsfield was to mobilize the militia and bring Indian troops to the Mediterranean; and finally Russia, finding that the diplomatic support which she had expected from Bismarck failed her, consented to submit the whole treaty without reserve to the congress.

On the 3rd of June Count Münster, in the name of the German government, issued the formal invitation to the congress. The congress met, under the presidency of Prince Bismarck, at Berlin on the 14th of June. Great Britain was represented by Lord Beaconsfield, Lord Salisbury and Lord Odo Russell, ambassador at Berlin; Germany by Prince Bismarck, Baron Ernst von Bülow and Prince Chlodwig von Hohenlohe-Schillingsfurst, ambassador at Paris; Austria by Count Andrassy, Count Louis Károlyi and Baron Heinrich Karl von Haymerle, ambassador at Rome; France by William II., Waddington, the Comte de Saint-Vallier, ambassador at Berlin, and Félix Hippolyte Desprez, director of political affairs in the department for foreign affairs; Russia by the chancellor, Prince Gorchakov, Count Peter Shuvalov, ambassador to the court of St James's, and Paul d'Oubril, ambassador at Berlin; Turkey by Alexander Voisky Pasha, minister of public works, Ali Pasha, micaish of the Ottoman armies, and Sadullah Bey, ambassador at Berlin. The bases of the conferences had, of course, been settled beforehand, and the final act of the congress was signed by the plenipotentiaries mentioned above exactly a month after the opening of the congress, on the 13th of July.

The treaty of Berlin consists in all of sixty-four articles, of which it will be sufficient to note those which have had a special bearing on subsequent international developments. So far as they affect the territorial boundaries fixed by the treaties of Paris and San Stefano it will be sufficient to refer to the sketch map in the article Europe: History. By Art. I. Bulgaria was "constituted an autonomous and tributary principality under the suzerainty of H.I.M. the Sultan"; it was to have a "Christian government and a national militia." Art. II. fixed
the boundaries of the new state and provided for their delimitation by a European commission, which was "to take into consideration the necessity for H.I.M. the Sultan to be able to defend the Balkan frontiers of Eastern Rumelia." Arts. III. to XII. provide for the election of a prince for Bulgaria, the machinery for settling the new constitution, the adjustment of the relations of the new Bulgarian government to the Ottoman empire and its subjects (including the question of tribute, the amount of which was, according to Art. XII., to be settled by agreement of the signature powers "at the close of the first year of the working of the new organization"). By Art. X. Bulgaria, so far as it was concerned, was to take the place of the Sublime Porte in the engagements which the latter had contracted, as well towards Austria-Hungary as towards the Rutschuck-Varna Railway Company, for working the railway of European Turkey in respect to the completion and connexion, as well as the working of the railways situated in its territory.

By Art. XIII. a province was formed south of the Balkans which was to take the name of "Eastern Rumelia," and was to remain "under the direct military and political control of H.I.M. the Sultan, under conditions of administrative autonomy." It was to have a Christian governor-general. Arts. XIV. to XXIII. define the frontiers and organization of the new province, questions arising out of the Russian occupation, and the rights of the sultan. Of the latter it is to be noted that the sultan retained the right of fortifying and occupying the Balkan passes (Art. XV.) and all his rights and obligations over the railways (Art. XXI.).

Art. XVII., which the events of 1908 afterwards brought into special prominence, runs as follows: "The provinces of Bosnia and Herzegovina shall be occupied and administered by Austria-Hungary. The government of Austria-Hungary, not desiring to undertake the administration of the sarrjak of Novi-Bazar, will, as the Ottoman administration will continue to exercise its functions there. Nevertheless, in order to assure the maintenance of the new political state of affairs, as well as freedom and security of communications, Austria-Hungary reserves the right of keeping garrisons and having military and commercial roads in the whole of this part of the ancient vilayet of Bosnia."

By Art. XXVI. the independence of Montenegro was definitively recognized, and by Art. XVIII. she received certain accessions of territory, including a strip of coast on the Adriatic, but under conditions which tended to place her under the tutelage of Austria-Hungary. Thus, by Art. XXIX. she was to have neither ships of war nor a war flag, the port of Antivari and all Montenegrin waters to be closed to the war-ships of all nations; the fortifications between the lake and the coast were to be razed; the administration of the maritime and sanitary police at Antivari and along the Montenegrin littoral to be carried on by Austria-Hungary "by means of light coast-guard boats"; Montenegro was to adopt the maritime code in force in Dalmatia, while the Montenegrin merchant flag was to be under Austro-Hungarian consular protection. Finally, Montenegro was to "come to an understanding with Austria-Hungary on the right to construct and keep up across the new Montenegrin territory a road and a railway."

By Art. XXXIV. the independence of Servia was recognized, subject to conditions (as to religious liberty, &c.) set forth in Art. XXXV. Art. XXXVI. defined the new boundaries.

By Art. XLI. the independence of Rumania, already proclaimed by the prince (May 22, 1877), was recognized. Subsequent articles define the conditions and the boundaries.

Arts. LI. to LVII. deal with the question of the free navigation of the Danube. All fortifications between the mouths and the Iron Gates were to be razed, and no vessels of war, save those of ligna Cogane in the service of the river police and the customs, were to navigate the river below the Iron Gates (Art. LII.). The Danube commission, on which Rumania was to be represented, was maintained in its functions (Art. LII.) and provision made for the further prolongation of its powers (Art. LIV.).

Art. LVIII. cedes to Russia the territories of Ardahan, Kars and Batoum, in Asiatic Turkey. By Art. LIX. "H.M. the emperor of Russia declares that it is his intention to constitute Batoum a free port, essentially commercial."

By Art. LXI. "the Sublime Porte undertakes to carry out, without further delay, the improvements and reforms demanded by local requirements in the provinces inhabited by the Armenians, and to guarantee their security against the Circassians and Kurds." It was to keep the powers informed periodically of "the steps taken to this effect."

Art. LXII. made provision for the securing religious liberty in the Ottoman dominions.

Finally, Art. LXIII. declares that "the treaty of Paris of 20th March 1856, as well as the treaty of London of 13th March 1871, are maintained in all such of their provisions as are not abrogated or modified by the preceding stipulations."

For the full text of the treaty in the English translation see E. Hertlet, Map of Europe by Treaty, vol. iv. p. 2759 (No. 530) for the French original see Slate Papers, vol. lxxxix. p. 749. (W. A. P.)

BERLIN, a city of Coos county, New Hampshire, U.S.A., on the Androscoggin river, in the N. part of the state, about 98 m. N.W. of Portland, Main. Pop. (1890) 5720; (1900) 8866, of whom 4643 were foreign-born; (1910 census) 11,782. The area of the city is 57.81 sq. m. Berlin is served by the Grand Trunk and Boston & Maine railways. It is situated in the heart of the White Mountains and 16 m. from the base of Mt. Washington. Berlin Falls, on the picturesque Androscoggin river, furnishes an immense water-power, the development of which for manufacturing purposes accounts for the rapid growth of the city. The forests of northern New England and of the province of Quebec supply the raw material for the extensive saw-mills and planing-mills, the pulp- and paper-mills, and the sulphite fibre mills, said to be the largest in existence. In 1905 the city's factory products were valued at $5,689,110, of which 78.5% was the value of the paper and wood pulp manufactured. Berlin was first settled in 1821, was incorporated as a township in 1829, and was chartered as a city in 1897.

BERLIN, a city and port of entry, Ontario, Canada, and capital of Waterloo county, 56 m. W. of Toronto, on the Grand Trunk railway. It is the centre of a prosperous farming and manufacturing district, inhabited chiefly by German immigrants and their descendants. An electric railway connects it with the town of Waterloo (pop. 4500) 2 m. to the north, which has an important flour and malt-mills and distilleries. Berlin is a flourishing manufacturing town, and contains a beet sugar refinery, automobile, leather, furniture, shirt and collar, felt, glove, button and rubber factories. Pop. (1881) 4054; (1901) 9747.

BERLIN, a four-wheeled carriage with a separate hooded seat, detached from the body of the vehicle; so called from having been first used in Berlin. It was designed about 1670, by a Piedmontese architect in the service of the elector of Brandenburg. It was used as a travelling carriage, and Swift refers to it in his advice to authors "who scribble in a berlin." As an adjective, the word is used to indicate a special kind of goods, originally made in Berlin, of which the best known is Berlin wool. A Berlin warehouse is a shop for the sale of wools and fancy goods (cf. Italian warehouse). The spelling "berlin" is also used by Sir Walter Scott for the "birlinn," a large Gaelic rowing-boat.

BERLOZ, HECTOR (1803–1869), French musical composer, was born on the 11th of December 1803 at Côte-Saint-André, a small town near Grenoble, in the department of Isère. His father, Marc Berloz, was a physician of repute, and by his desire Hector for some time devoted himself to the study of medicine. At the same time he had music lessons, and, in secret, pursued numerous theoretical works on counterpoint and harmony, with little profit it seems, till the hearing and subsequent careful analysis of one of Haydn's quartets opened a new vista to his unguided aspirations. A similar work written by Berloz in imitation of Haydn's masterpiece was favorably received by his friends. From Paris, where he had been sent to complete his
medical studies, he at last made known to his father the unalterable decision of devoting himself entirely to art, the answer to which was the withdrawal of all further pecuniary assistance. To order to support life Berlioz had to accept the humble engagement of a singer in the chorus of the Gymnase Theatre. Soon, however, he became reconciled to his father and entered the Conservatoire, where he studied composition under Reicha and Lesueur. His first important composition was an opera called Les Francs-Juges, of which, however, only the overture remains extant. In 1825 he left the Conservatoire, and began a course of self-education, founded chiefly on the works of Beethoven, Gluck, Weber and other German masters. About this period Berlioz saw for the first time the talented Irish actress Henrietta Smithson, who was then charming Paris by her impersonations of Ophelia, Juliet and other Shakespearean characters. The enthusiastic young composer became deeply enamoured of her at first sight, and tried, for a long time in vain, to gain the love or even the attention of his idol. To an incident of this wild and persevering courtship Berlioz's first symphonic work, Épisode de la vie d'un artiste, owes its origin. By the advice of his friends Berlioz once more entered the Conservatoire, where, after having composed the overture to La Damnation de Faust, he won the first prize for foreign travel (1830), in spite of the strong personal antagonism of one of the umpires. During a stay in Italy Berlioz composed an overture to King Lear, and Le Retour à la vie—a sort of symphony, with intervening poetical declamation between the single movements, called by the composer a melologue, and written in continuation of the Épisode de la vie d'un artiste, along with which work it was performed at the Paris Conservatoire in 1832. Pagani on that occasion spoke to Berlioz the memorable words: “Vous commencez par où les autres ont fini.” Miss Smithson, who was also present on the occasion, consented to become the wife of her ardent lover in 1833. The marriage was a tempestuous mistake. In 1840 he separated from her, who died in 1854. Six months later Berlioz married Madeleine Récio. His second wife did not live very long, nor was there much that was edifying in this marriage. Between the date of his first marriage and 1840 came out his dramatic symphonies Harold en Italie, Faneur et triompheur, and Roméo et Juliette; his opera Benvenuto Cellini (1837); his overtures, among which were La Damnation de Faust, Berlioz on his due share of the distinctions generally awarded to artistic merit, such as the ribbon of the Legion of Honour and the membership of the Institute. But these distinctions he owed, perhaps, less to a genuine admiration of his compositions than to his successes abroad and his influential position as the musical critic of the Journal des Débats (a position which he held from 1835 to 1864, and which he never used or abused to push his own works). In 1842 Berlioz went for the first time to Germany, where he was hailed with welcome by the leading musicians of the younger generation, Robert Schumann foremost amongst them. The latter paved the way for the French composer's success by a comprehensive analysis of the Épisode in his musical journal, the Neue Zeitschrift für Musik. In 1846 he produced his magnificent cantata La Damnation de Faust. Berlioz gave successful concerts at Leipzig and other German cities, and repeated his visit on various later occasions—in 1852 by invitation of Liszt, to conduct his opera, Benvenuto Cellini (kissed off the stage in Paris), at Weimar; and in 1861 he produced his oratorio-trilogy, L'Enfance du Christ, in the same city. This latter work had been previously performed at Paris, where Berlioz mystified the critics by pretending to have found the last chorus amongst the manuscript scores of a composer of the 17th century, Pierre Ducrè by name. In 1855 his Te Deum was written for the opening of the Paris exhibition. Berlioz also made journeys to Vienna (1866) and St Petersburg (1867), where his works were received with great enthusiasm. In 1861 he produced his work Béatrice et Bénédict, and in 1863 Les Troyens. He died in Paris on the 8th of March 1869.

But it is as the symbol of French romanticism in the whole domain of aesthetic perception that his pre-eminence has come to be recognized. His Mémoires (begun in London in 1848 and finished in 1865) illustrate this romantic spirit at its highest elevation as well as at its lowest depths. Victor Hugo was a romantic, Musset was a romantic, but Berlioz was romanticism itself. As a boy he is in despair over the despair of Dido, and his breath is taken away at Virgil's "Quaevisit coelo lucem ingemuitque reperta." At the age of twelve he is in love with "Estelle," whom he meets fifty years afterwards. The scene is described by himself (1865) with minute fidelity—a scene which Flaubert must have known by heart when he wrote its parallel in the novel L'Éducation sentimentale. The romance of this meeting between the man—old, isolated, unspeakably sad, with the halo of public fame burning round him—and the woman—old also, a mother, a widow, whose beauty he worshipped when she was eighteen—is striking. In a frame of chastened melancholy and joy at the sight of Estelle, Berlioz goes to dine with Patti and her family. Patti, on the threshold of her career, pets Berlioz with such uncontrollable affection, that as the composer confessed of his feelings he was overpowered at the bitterness of fate. What would he not have given for Estelle to show him such affection! Patti seemed to him like a marvellous bird with diamond wings flitting round his head, resting on his shoulder, plucking his hair and singing her most joyous songs to the accompaniment of beating wings.

"I was enchanted but not moved. The fact is that the young, beautiful, dazzling, famous virtuoso who at the age of twenty-five has already seen musical Europe and America at her feet, does not win the power of love in me; and the aged woman, sad, obscure, ignorant of art, possesses my soul as she did in the days gone by, as she will do until my last day." If this episode touches the sublime, it may be urged with almost equal truth that his description of the exhumation of his two wives and their reburial in a single tomb touches the ridiculous. And yet the scene is described with a perception of all the detail which would call for the highest praise in a novelist. Perhaps some parallel between the splendid and the ridiculous in this singular figure may be seen in the comparison of Nadar's caricature with Charpentier's portrait of the composer.

The profound admiration of Berlioz for Shakespeare, which rose at moments to such a pitch of folly that he set Shakespeare in the place of God and worshipped him, cannot be explained simply on the ground that Henrietta Smithson was a great Shakespearean actress. Unquestionably the great figures in English literature had a profound attraction for him, and while the romantic spirit is obvious in his selections from Byron and Scott, it can also be traced in the quality of his enthusiasm for Shakespeare. It is in his music more than in his literary attitude, however, that is disclosed something in addition to the pure romance of Schumann,—something that places him nearer in kind to Wagner, who recognized in him a composer from whose works he might learn something useful for the cultivation of his own ideals. As a youth the power of Beethoven's symphonies made a deep impression on Berlioz, and what has been described as the "poetical idea" in Beethoven's creations ran riot in the young student's mind. He thus became one of the most ardent and enlightened originators of what is now known as "programme music." Technically he was a brilliant musical colourist, often extravagant, but with the extravagant emotionalism of genius. He was a master of the orchestra; indeed, his treatment of the orchestra and his invention of unprecedented effects of timbre give him a solitary position in musical history; he had an extraordinary gift for the use of the various instruments, and himself propounded a new ideal for the force to be employed, on an enormous scale.

His literary works include the Traité d'instrumentation (1844); Voyage musical en Allemagne et en Italie (1845); Les Soirées d'orchestre (1853); Les Grotesques de la musique (1859); À travers chant (1862); Mémoires (1870); Lettres intimes (1882). For a full list of his musical works, Grove's Dictionary should be consulted.
The new critical edition of the complete musical works (published by Breitkopf and Hartel) is in ten series. I. Symphonies: Fantasie, Op. 14; Funèbre et triomphale, Op. 15, for military band and chorus; Harald en Italie, Op. 16, with viola solo; Roméo et Juliette, with chorus and soli. II. Overtures (ten, including the five belonging to larger works). III. Smaller instrumental works of which only the Funeral March for Hamlet is important. IV. Sacred music: the Grande Messe des morts, Op. 5; the Te Deum, Op. 22; L’Enfance du Christ, Op. 25, and four smaller pieces. V. Secular cantatas, including Hai les beaux ~; Faisons l’opéra; L’Enfance de Faust, Op. 17; Lélio, ou le retour à la vie, Op. 146 (sequel to Symphonie fantastique), and La Damnation de Faust, Op. 24. VI. Songs and lyric choruses with orchestra, two vols. VII. Songs and lyric choruses with piano forte, 2 vols. including the six of the grand opéra songs. VIII. Operas: Benvenuto Cellini; Les Troyens à Carthage; Recitatifs for the dialogue in Weber’s Freischütz. IX. Arrangements, including the well-known orchestral version of Weber’s Invitation à la danse. X. Fragments and new discoveries.

Adolphe Julien’s biography of Berlioz (1888) first gave a careful account of the details of his life. See also the books by R. Pohl (1884), P. Gallbert (1890), E. Hildeau (1890), G. Noufflard (1885), L. Meunier (1888), Louise Pohl (1900), and D. Bertrand (1982). An illuminating essay on Berlioz is in Filsom Young’s Masterpieces (1902). See also the essay in W. H. Hadow’s Studies in Modern Music (1st series, 1908). Berlioz’s Traité des instruments de musique has been reprinted in Breitkopf (cf. 1888) and brought up to date by Richard Strauss (Peters’ edition [1906]).

BERM (probably a variant of “birm”), a narrow ledge of ground, generally the level banks of a river. In parts of Egypt the whole area reached by the Nile is included in the berm. Thus of the lands near Berber, Mr C. Dupuis writes (in Sir William Garstin’s Report on the Upper Nile, 1904), “In most places there is a well-defined alluvial berm of recent formation and varying width, up to perhaps a couple of kilometres.” In military phraseology the berm is the space of ground between the base of a rampart and the ditch.

BERMONDSEY, a south-eastern metropolitan borough of London, England, bounded N. and E. by the Thames, S.E. by Deptford, S.W. by Camberwell, and W. by Southwark. Pop. (1901) 130,760. It is a district of poor streets, inhabited by a labouring population employed in leather and other factories, and in the Surrey Commercial Docks and the wharves bordering the river. The parish of Rotherhithe or Redriff has long been associated with a seafaring population. A tunnel connecting it with the opposite shore of the river was opened in June 1868. The neighbouring Thames Tunnel was opened in 1843, but, as the tolls were insufficient to maintain it, was sold to the East London and Blackwall Railway Company in 1865. The Heroic Institute, a branch of the Borough Polytechnic, Southwark, is devoted to instruction in connexion with the leather trade. Southwark Park in the centre of the borough is 63 acres in extent. Bermondsey is in the parliamentary borough of Southwark, including the whole of Rotherhithe and part of the Bermondsey division. The borough council consists of a mayor, 9 aldermen, and 54 councillors. Area 1490-9 acres.

The name appears in Domedas, the suffix designating the former insular, marshy character of the district; while the prefix is generally taken to indicate the name of a Saxon overlord, Beornmund. Bermondsey was in favour with the Norman kings as a place of residence, and there was a palace here, perhaps from pre-Norman times. A Cluniac monastery was founded in 1082, and Bermondsey Cross became a favoured place of pilgrimage. The foundation was erected into an abbey in 1309, and Abbey Road recalls its site. Similarly, Spa Road points to the existence of a popular spring and pleasure grounds, maintained for some years at the close of the 18th century. Jacob Street marks Jacob’s Island, the scene of the death of Bill Sikes in Dickens’ Oliver Twist. Tooley Street, leading east from Southwark by London Bridge railway station, is well known in connexion with the story of three tailors of Tooley Street, who addressed a petition to parliament with the comprehensive expression “We, the people of England.” The name is a corruption of St Olave, or Olaf, the Christian king of Norway, who in 940 attacked London by way of the river, and broke down London Bridge.

See E. T. Clarke, Bermondsey, its Historic Memories (1901)

BERMUDAS, a group of islands in the Atlantic Ocean, forming a British colony, in 32° 15’ N. and 64° 50’ W., about 580 m. E. by S. from Cape Hatteras on the American coast. The group, consisting of small islands and reefs (which mark the extreme northern range of the coral-building polyps), is of oval form, measuring 22 m. from N.E. to S.W., the area being 20 sq. m. The largest of the islands is Great Bermuda, or the Main Island, 14 m. long and about a mile in average width, enclosing on the east Harrington or Little Sound, and on the west the Great Sound, which is thickly studded with islets, and protected on the north by the islands of Watford, Boaz, Ireland and Somerset. The remaining members of the group, St George, Paget, Smith, St David, Cooper, Nonsuch, &c, lie N.E. of the Main Island, and form a semicircle round Castle Harbour. The fringing islands which encircle the islands, especially on the north and west, leave a few deep passages wide enough to admit the largest vessels.

Geology.—The Bermudas consist of aeolian limestones (cf. Bahamas) which in some of the larger islands form irregular hills attaining a height of some 200-250 ft. These limestones are composed chiefly of comminuted shells drifted and deposited by the wind, and they are very irregularly stratified, as is usually the case with wind-blown deposits. Where fresh the rock is soft, but where it has been exposed to the action of the sea it is covered by a hard crust and often loses all trace of stratification. These soft portions of the greatest thicknesses have not been raised to a higher level than the sea. The limestones are not wholly formed of coral. They are ridges of aeolian limestone plastered over by a thin layer of corals and other calcareous organisms. The very remarkable “serpuline atoll” are covered by a solid crust made of the convoluted tubes of serpuline and verticula, together with barnacles, mussels, nippilores, corallines and some true incrusting corals. They probably rest upon a foundation of aeolian rock. The Bermudas were formerly much more extensive than at present, and they may possibly stand upon the summit of a hidden volcano. There are evidences of small oscillations of levels, but no proofs of great elevation or depression.

Soil, Climate, &c.—The surface soil is a curious kind of red earth, which is also found in ochre-like strata throughout the limestone. It is generally mixed with vegetable matter and coral sand. There is a total want of streams and wells of fresh water, and the inhabitants are dependent on the rain, which they collect and preserve in tanks. The climate is mild and healthy, although serious epidemics of yellow fever and typhus have occurred. The maximum reading of the thermometer at the capital, Hamilton, is 95°, but the mean annual temperature being 70°. The islands attract a large number of visitors annually from America. Vegetation is very rapid, and the soil is clad in a mantle of almost perpetual green. The principal kind of tree is the so-called “Bermuda cedrel,” really a species of juniper, which furnishes timber for small vessels. The shores are fringed with the mangrove; the prickly pear grows luxuriantly in the most barren districts; and wherever the ground is left to itself the sage bush springs up profusely. The citrus, sour orange, lemon and lime grow wild; but the apple and peach do not come to perfection. The loquat, an introduction from China, thrives admirably. The mild climate assists the growth of esculent plants and roots; and a considerable trade is carried on with New York, principally in onions, early potatoes, tomatoes, and beetroot, together with lily bulbs, cut flowers and some arrowroot. Medicinal plants, as the castor-oil plant and aloe, come to perfection without culture; and coffee, indigo, cotton and tobacco are also of spontaneous growth. Few oxen or sheep are reared in the colony, meat, as well as bread and most vegetables, being imported from America. The indigenous mammals are very few, and the only reptiles are a small lizard and the green turtle. Birds, however, especially aquatic species, are very numerous. Insects are comparatively few, but ants swarm destructively in the heat of the year. Fish are plentiful round the coasts, and the whale-fishery was once an important industry, but the fisheries as a whole have not been developed.

Towns, and Administration.—There are two towns in the Bermudas: St George, on the island of that name, founded in
BERMUDA—BERN

1794 and incorporated in 1797; and Hamilton, on the Main Island, founded in 1790 and incorporated in 1793. St. George was the capital till the senate and courts of justice were removed by Sir James Cockburn to Hamilton, which being centrally situated, is more convenient. Hamilton, which is situated on the inner part of the Great Sound, had a population in 1801 of 2,246, that of St. George being 852. In Ireland Island is situated the royal dockyard and naval establishment. The harbour of St. George's has space enough to accommodate a vast fleet; yet, till deepened by blasting, the entrance was so narrow as to render it almost useless. The Bermudas became an important naval and coaling station in 1806, when a large iron dry dock was-removed to the Atlantic and placed in a secure position in St. George, while, owing to their important strategic position in mid-Atlantic, the British government maintains a strong garrison. The Bermudas are a British crown colony, with a governor resident at Hamilton, who is assisted by an executive council of 6 members appointed by the crown, a legislative council of 9, and a representative assembly of 36 members, of whom four are returned by each of nine parishes. The currency of the colony, which had formerly twelve shillings to the pound sterling, was assimilated to that of England in 1842. The English language is universal. The colony is ecclesiastically attached to the bishopric of Newfoundland. In 1847 an educational board was established, and three various schools; and in 1851 the first of the schools is free. Government scholarships enable youths to be educated for competition in the Rhodes scholarships to Oxford University. The revenue of the islands shows a fairly regular increase during the last years of the 19th century and the first of the 20th, as from £37,830 in 1895 to £63,457 in 1904; expenditure is normally rather less than revenue. In the year last named imports were valued at £58,979 and exports at £130,305, the annual averages since 1895 being about £426,300 and £112,500 respectively. The population shows a steady increase, as from 13,928 in 1881 to 17,535 in 1901; 6383 were whites and 11,152 coloured in the latter year.

History.—The discovery of the Bermudas resulted from the shipwreck of Juan Bermudez, a Spaniard (whose name they now bear), when on a voyage from Spain to Cuba with a cargo of hogs, early in the 16th century. Henry May, an Englishman, suffered the same fate in 1593; and lastly, Sir George Somers shared the destiny of the two preceding navigators in 1609. Sir George, from whom the islands took the descriptive name of Somers Islands, was the first to attempt settlement upon them, but he died where he had fully accomplished his design. In 1612 the Bermudas were granted to an offshoot of the Virginia Company, which consisted of 120 persons, 60 of whom, under the command of Henry More, proceeded to the islands. The first source of colonial wealth was the growing of tobacco, but the curing industry ceased early in the 18th century. In 1726 Bishop George Berkeley chose the Bermudas as the seat of his projected missionary establishment. The first newspaper, the Bermuda Gazette, was published in 1784.

BERMUIDE, a N.E. state of Venezuela, between the Caribbean Sea and the Orinoco river, bounded E. by the gulf of Paria and N. by the French Guiana territory, and W. by the states of Guarico and Miranda. Pop. (est. 1905) 364,158. It was created in 1881 by the union of the states of Barcelona, Cumaná and Maturin, dissolved in 1901 into its three original states, and reorganized in 1904 with slight modification of territory. The state includes the oldest settlements in Venezuela, and was once very prosperous, producing cattle and exporting hides, but wars and political disorders have partly destroyed its industries and impeded their development. Its principal productions are coffee, sugar, and cacao, and—less important—cotton, tobacco, cocoons to the timber, indigo and dyewoods. Its more important towns are the capital, Barcelona, Maturin (pop. 14,471), capital of a district of the same name, and Cumaná (10,000), on the gulf of Cariaco, founded in 1520 and one of the oldest towns of the continent.

BERN (Fr. Berne), after the Grisons, the largest of the Swiss cantons, but by far the most populous, though politically Bern ranks after that of Zurich. It extends right across Switzerland from beyond the Jura to the snow-capped ranges that separate Bern from the Valais. Its total area is 2641 sq. m., of which 2081 sq. m. are classed as “productive” (including 591 sq. m. of forests, and 211 m. of vineyards), while of the remainder 111.3 sq. m. are occupied by glaciers (the Valais and the Grisons alone surpass it in this respect). It is mainly watered by the river Aar (q.v.), with its affluents, the Kander (left), the Saane or Sarine (left) and the Emme (right); the Aar forms the two lakes of Brienz and Thun (q.v.). The great extent of this canton accounts for the different character of the regions therein comprised. Three are usually distinguished:—(1) The Oberland or Highlands, which is best known to travellers, for it includes the snowy Alps from the Oberseen to the Saane river, and the Jura and the open country on every side of the town of Bern. (2) The Mittelland (Lake District) and the Jura, extending from Bienne and its lake across the Jura to Porrentruy in the plains and to the upper course of the Aar. The Oberland and Mittelland form the “old” canton, the Bern having only been acquired in 1815, and differing from the rest of the canton by reason of its French-speaking and Romanist inhabitants.

In 1800 the total population of the canton was 580,453, of whom 483,388 were German-speaking, 97,785 French-speaking, and 7167 Italian-speaking; while there were 306,699 Protestants, 80,489 Romanists (including the Old Catholics), and 1543 Jews. The capital is Bern (q.v.), while the other important towns are Bienne (q.v.), Burgdorf (q.v.), Delémont (5053 inhabitants), Muri (14,026 inhabitants), Porrentruy (4799 inhabitants), Thun (35,215 inhabitants), and Langenthal (4799 inhabitants). There is a university (founded in 1634) in the town of Bern, as well as institutions for higher education in the principal towns. The canton is divided into 30 administrative districts, and contains 507 communes (the highest number in Switzerland). From 1803 to 1814 the canton was one of the six “Directorial” cantons of the Confederation. The existing cantonal constitution dates from 1803, but in 1869 the direct popular election of the executive of 9 members (hitherto named by the legislature) was introduced. The legislature or Grossrat is elected for four years (like the executive), in the proportion of 1 member to every 2500 (or fraction over 1250) of the resident population. The obligatory Referendum obtains in the case of all laws, and of decrees relating to an expenditure of over half a million francs, while 12,000 citizens have the right of initiative in the case of legislative projects, and 15,000 may demand the revision of the cantonal constitution. The 2 members sent by the canton to the federal Ständerath are elected by the Grossrat, while the 39 members sent to the federal Parliament by general (Sonderwahlen) or direct election. In the Alpine portions of the canton the breeding of cattle (those of the Simme valley are particularly famous) is the chief industry; next come the elaborate arrangements for summer travellers (the Fremdenindustrie). It is reckoned that there are 2430 “Alps” or mountain pastures in the canton, of which 1474 are in the Oberland, 627 in the Jura, and 280 in the Emme valley; they maintain 95,478 cows and are of the estimated value of 463 million francs. The cheese of the Emme valley is locally much esteemed. Other industries in the Alpine region are wood-carving (at Brienz) and wine manufacture (on the shores
of the lakes of Bienna and of Thun. The Mittelland is the agricultural portion of the canton. Watchmaking is the principal industry of the Jura, Bienna, and St Imier being the chief centres of this industry. Iron mines are also worked in the Jura, while the Heimberg potteries, near Thun, produce a locally famous ware, and there are both quarries of building stone and tile factories. The canton is well supplied with railway lines, the broad gauge lines being 228 m. in length, and the narrow gauge lines 1573 m.—in all 3853 m. Among these are many funicular cog-wheel lines, climbing up to considerable heights, so up to Mürren (3528 ft.), over the Wengern Alp (6772 ft.), up to the Schynige Platte (6463 ft.), and many others still in the state of projects. All these are in the Oberland where, too, is the so-called Jungfrau railway, which in 1906 attained a point (the Eisee station) in the south wall of the Eiger (13,042 ft.) that was 10,371 ft. in height, the loftiest railway station in Switzerland.

The canton of Bern is composed of the various districts which the town of Bern acquired by conquest or by purchase in the course of time. The more important, with dates of acquisition, are the following:—Laupen (1324), Hasli and Meiringen (1334), Thun and Burgdorf (1384), Unter Simme valley (1384, 1390), Kander (1390), Unter Simme valley (1439-1441), Schöfflins, with Grindelwald, LAuterbrunnen and Brienitz (1528, on the suppression of the Austin Canons of Interlaken), Saanen or Gisenay (1535), Köniz (1720), and the Bernese Jura with Bienna (1814, from the bishopric of Basel). But certain regions previously won were lost in 1706—Aargau (1415), Aigle and Grandson (1475), Vaud (1516), and the Pays d'Éa-Haut or Château d'Oex (1553). From 1798 to 1802 the Oberland formed a separate canton (capital, Thun) of the Helvetic Republic.

**BERN (Fr. Berne),** the capital of the Swiss canton of the same name, and, by a Federal law of 1848, the political capital of the Swiss confederation. It is most picturesquely situated on a high bluff or peninsula, round the base of which flows the river Aar, thus completely cutting off the old town, save to the west. Five lofty bridges have been thrown over the Aar, the two most modern being the Kirchfeld and Konhuis bridges which have greatly contributed to create new residential quarters near the old town. Within the town the arcades (or Lauben) on either side of the main street, and the numerous elaborately ornamented fountains attract the eye, as well as the two remaining towers that formerly stood on the old walls but are now in the centre of the town; the Zeitglockenturm (famous for its singular sixteenth-century clock, with its mechanical contrivances, set in motion when the hour strikes) and the Käfigturm. The principal medieval building in Bern is the (now Protestant) Münster, begun in 1421 though not completed till 1573. The tower, rising conspicuously above the town, has recently been well restored, but the church was never a cathedral church (as is often stated), for there has never yet been a bishop of Bern. The federal Houses of Parliament (Bundeshaus) were much enlarged in 1888-1892, the older portions dating from 1832-1837, and also contain the offices of the federal executive and administration. The town-hall dates from 1406, while some of the houses belonging to the old guilds contain much of interest. The town library (with which that of the university was incorporated in 1906) contains a vast store of MSS. and rare printed books, but should be carefully distinguished from the national Swiss library, which, with the building for the federal archives, is built in the new Kirchfeld quarter. There are a number of museums; the historical (archaeological and medieval), the natural history (in which the skin of Barry, the famous St Bernard dog, is preserved), the art (mainly modern Swiss pictures), and the Alpine (in which are collections of all kinds relating to the Swiss Alps). Bern possesses a university (founded in 1834) and two admirably organized hospitals. The old fortifications (Schanzen) have been converted into promenades, which command wonderful views of the snowy Alps of the Bernese Oberland. Just across the Nydegg bridge is the famous bear pit in which live bears are kept, as they are supposed to have given the name to the town; certainly a bear is shown on the earliest known town seal (1241), while live bears have been maintained at the charges of the town since 1513. There is comparatively little industrial activity in the town, the importance of which is mainly political, though of late years it has been selected as the seat of various international associations (postal, telegraph, railway, copyright, &c.). The climate is severe, as the town is much exposed to cold winds blowing from the snowy Alps. In point of population it is exceeded in Switzerland by Zürich, Basel and Geneva, though the number of inhabitants has risen from 27,558 in 1850 and 43,107 in 1880 to 64,277 in 1900. In 1900, 59,608 inhabitants were German-speaking; while 37,144 were Protestants, 6087 Romanists (including Old Catholics) and 656 Jews. The height of the town above the sea-level is 1738 ft.

The ancient castle of Nydegg, at the eastern end of the peninsula, guarded the passage over the Aar, and it was probably its existence that induced Berchtold V., duke of Züringen, to found Bern in 1191 as a military post on the frontier between the Alamannians (German-speaking) and the Burgundians (French-speaking). Thrice the walls which protected the town were moved westwards (1250, 1528, 1621), but in 1621, at the last named date the town only stretched a little way to the west of (or beyond) the present railway station. After the extinction of the Zürieng dynasty (1218) Bern became a free imperial city, but it had to fight hard for its independence, which was finally secured by the victories of Dornbühl (1296) over Fribourg and the Habsburgs, and of Laupen (1339) over the neighbouring Burgundian nobles. In the second battle Bern received help from the three forest cantons with which it had become allied in 1323, while in 1353 it entered the Swiss confederation as its eighth member. It soon took the lead in the confederation, though always aiming at enlarging its own borders, even at great risks (see the article on the canton). In 1528 Bern accepted the religious reformation, and henceforth became one of its chief champions in Switzerland. In the 17th century the number of families by which high offices of state could be held was diminished, so that in 1695 there were 152 thus qualified, but in 1691 only 104, while towards the end of the 18th century there were only 69 such families. Meanwhile the rule of the town was extending over more and more territory, so that finally it had 12 bailwicks (acquired between 1324 and 1729), the Bernese patricians being thus extremely powerful and forming an oligarchy that administered affairs like a benevolent and well-ordered despotism. In 1723 Major Davel, at Lausanne, and in 1749 Henzi, in Bern itself, tried to break down this monopoly, but in each case paid the penalty of failure on the scaffold. The whole system was swept away by the French in 1798, and though partially revived in 1815, came to an end in 1831, since which time Bern has been in the van of political progress. From 1815 to 1848 it shared with Zürich and Lucerne the supreme rule (which shifted from one to the other every two years) in the Swiss confederation, while in 1848 a federal law made Bern the sole political capital, where the federal government is permanently fixed and where ministers of foreign powers reside.

BERNARD, SAINT  

BERNARD, SAINT (1090–1153), abbot of Clairvaux one of the most illustrious preachers and monks of the middle ages, was born at Fontaines, near Dijon, in France. His father, a knight named Tescin, perished on crusade; and his mother Aetha, a daughter of the noble house of Mon-Bar, and a woman distinguished for her piety, died while Bernard was yet a boy. The lad was constitutionally unfitted for the career of arms, and his own disposition, as well as his mother’s early influence, directed him to the church. His desire to enter a monastery was opposed by his relations, who sent him to study at Châlons in order to qualify for high ecclesiastical preferment. Bernard’s resolution to become a monk was not, however, shaken, and when he at last definitely decided to join the community which Robert of Molesmes had founded at Citeaux in 1105, he carried with him his brothers and many of his relations and friends. The little community of reformed Benedictines, which was to produce so profound an influence on Western monachism (see CISTERCIANS and MONASTICISM) and had seemed on the point of extinction for lack of novices, gained a renewed life through this accession of some thirty young men of the best families of the neighbourhood. Others followed their example; and the community grew so rapidly that it was able to found or affiliate ninety-three daughter monasteries, Clairvaux, founded in 1115, in a wild valley branching from that of the Aube, on land given by Count Hugh of Troyes, and of this Bernard was appointed abbot.

By the new constitution of the Cistercians Clairvaux became the chief monastery of the five branches into which the order was divided under the supreme direction of the abbot of Citeaux. Though nominally subject to Citeaux, however, Clairvaux soon became the most important Cistercian house, owing to the fame and influence of Bernard. He is a saintly character, his self-mortification—of so severe a character that his friend, William of Champeaux, bishop of Châlons, thought it right to remonstrate with him—and above all, his marvellous power as a preacher, soon made him famous, and drew crowds of pilgrims to Clairvaux. His miracles were noise abroad, and sick folk were brought from near and far to be healed by his touch. Before long the abbot, who had intended to devote his life to the work of his monastery, was drawn into the affairs of the great world. When in 1124 Pope Honorius II. mounted the chair of St Peter, Bernard was already reckoned among the greatest of churchmen; he now shared in the most important ecclesiastical discussions, and papal legates sought his counsel. Thus in 1128 he was invited by Cardinal Matthew of Albano to the synod of Troyes, where he was instrumental in obtaining the recognition of the new order of Knights Templars, the rules of which he is said to have drawn up; and in the following year, at the synod of Châlons-sur-Marne, he ended the crisis arising out of certain charges brought against Henry, bishop of Verdun, by persuading the bishop to resign. The European importance of Bernard, however, began with the death of Pope Honorius II. (1130) and the disputed election that followed. In the synod convened by Louis the Fat at Étampes in April 1130 Bernard successfully asserted the claims of Innocent II. against those of Anacletus II., and from this moment became the most influential supporter of his cause. He threw himself into the contest with characteristic ardour. While Rome itself was held by Anacletus, France, England, Spalum and Germany declared for Innocent, who, though banished from Rome, was—in Bernard’s phrase—“accepted by the world.” The pope travelled from place to place, with the powerful abbot of Clairvaux at his side; he stayed at Clairvaux itself, humble still, so far as its buildings were concerned; and he went with Bernard to parley with the emperor Lothair III. at Liège.

In 1133, the year of the emperor’s first expedition to Rome, Bernard was in Italy persuading the Genoese to make peace with the men of Pisa, since the pope had need of both. He accompanied Innocent to Rome, successfully resisting the proposal to reopen negotiations with Anacletus, who held the castle of Sant’ Angelo and, with the support of Roger of Sicily, was too strong to be subdued by force. Lothair, though crowned by Innocent in St Peter’s, could do nothing to establish him in the Holy See so long as his own power was sapped by his quarrel with the house of Hohenstaufen. Again Bernard came to the rescue; in the spring of 1135 he was at Bamberg successfully persuading Frederick of Hohenstaufen to submit to the emperor. In June he was back in Italy, taking a leading part in the council of Pisa, by which Anacletus was excommunicated. In northern Italy the effect of his personality and of his preaching was immense; Milan itself, of all the Lombard cities most jealous of the imperial claims, surrendered to his eloquence, submitted to Lothair and to Innocent, and tried to force Bernard against his will into the vacant see of St Ambrose. In 1137, the year of Lothair’s last journey to Rome, Bernard was back in Italy again; at Monte Cassino, setting the affairs of the monastery in order, at Salerno, trying in vain to induce Roger of Sicily to declare against Anacletus, in Rome itself, agitating with success against the antipope. Anacletus died on the 25th of January 1138; on the 13th of March the cardinal Gregory was elected his successor, assuming the name of Victor. Bernard’s crowning triumph in the long contest was the abdication of the new antipope, the restoration of Innocent’s authority. The schism of the church was healed, and the abbot of Clairvaux was free to return to the peace of his monastery.

Clairvaux itself had meanwhile (1135–1136) been transformed outwardly—in spite of the reluctance of Bernard, who preferred the rough simplicity of the original buildings—into a more suitable seat for an influence that overshadowed that of Rome itself. How great this influence was is shown by the outcome of Bernard’s contest with Abelard (q.v.). In intellectual and dialectical power the abbot was no match for the great schoolman; yet at Sens in 1141 Abelard feared to face him, and when he appealed to Rome Bernard’s word was enough to secure his condemnation.

One result of Bernard’s fame was the marvellous growth of the Cistercian order. Between 1130 and 1145 no less than ninety-three monasteries in connexion with Clairvaux were either founded or affiliated from other rules, three being established in England and one in Ireland. In 1145 a Cistercian monk, once a member of the community of Clairvaux—another Bernard, abbot of Aiguebelle near Rome—was elected pope as Eugenius III. This was a triumph for the order; to the world it was a triumph for Bernard, who complained that all who had suits to press at Rome applied to him, as though he himself had mounted the chair of St Peter (Ep. 239).

Having healed the schism within the church, Bernard was next called upon to attack the enemy without. Laodoco especially had become a hotbed of heresy, and at this time the preaching of Henry of Lausanne (q.v.) was drawing thousands from the orthodox faith. In June 1145, at the invitation of Cardinal Alberic of Ostia, Bernard travelled in the south, and by his preaching did something to stem the flood of heresy for a while. Far more important, however, was his activity in the following year, when, in obedience to the pope’s command, he preached a crusade. The effect of his eloquence was extraordinary. At the great meeting at Vezelay, on the 21st of March, as the result of his sermon, King Louis VII. of France and his queen, Eleanor of Guinée, took the cross, together with a host of others; so numerous that the stock of crosses was soon exhausted; Bernard next travelled through northern France, Flanders and the Rhine provinces, everywhere rousing the wildest enthusiasm; and at Spires on Christmas day he succeeded in persuading Conrad, king of the Romans, to join the crusade.

The lamentable outcome of the movement (see CRUSADES) was a hard blow to Bernard, who found it difficult to understand this manifestation of the hidden counsels of God, but ascribed it to the sins of the crusaders (Ep. 288; de Consid. ii. 1). The news of the disasters to the crusading host first reached Bernard at Clairvaux, where Pope Eugenius, driven from Rome by the revolution associated with the name of Arnold of Brescia, was his guest. Bernard had in March and April 1148 accompanied the pope to the council of Reims, where he led the attack on

1 The Cistercians of this branch of the order were commonly known as Bernardines.
certain propositions of the scholastic theologian Gilbert de la Porée (q.v.). From whatever cause—whether the growing jealousy of the cardinals, or the loss of prestige owing to the rumoured failure of the crusade, the success of which he had so confidently predicted—Bernard's influence, hitherto so ruinous to those suspected of heresy, on this occasion failed of its full effect. On the news of the full extent of the disaster that had overtaken the crusaders, an effort was made to retrieve it by organizing another expedition. At the invitation of Suger, abbot of St Denis, now the virtual ruler of France, Bernard attended the meeting of Chartres convened for this purpose, where he himself was elected to conduct the new crusade, the choice being confirmed by the pope. He was saved from this task, for which he was physically and constitutionally unfit, by the intervention of the Cistercian abbots, who forbade him to undertake it.

Bernard was now ageing, broken by his austerities and by ceaseless work, and saddened by the loss of several of his early friends. But his intellectual energy remained undiminished. He continued to take an active interest in ecclesiastical affairs, and his last work, the De Consideratione, shows no sign of failing power. He died on the 20th of August 1153.

The greatness of St Bernard lay not in the qualities of his intellect, but of his character. Intellectually he was the child of his age, inferior to those subtle minds whom the world, fired by his contagious zeal, conspired to crush. Morally he was their superior; and in this moral superiority lay the secret of his power. The age recognized in him the embodiment of its ideal: that of medieval monasticism at its highest development. The world had no meaning for him save as a place of banishment and trial, in which men are but "strangers and pilgrims" (Serm. i., Epiph. n. 1; Serm. vii., Lent. n. 1); the way of grace, back to the lost inheritance, had been marked out once for all, and the function of theology was but to maintain the landmarks inherited from the past. With the subtleties of the schools he had no sympathy and the dialectics of the schoolmen quavered into silence before his terrible invective. Yet, within the limits of his mental horizon, Bernard's vision was clear enough. His very life proves with what merciless logic he followed out the principles of the Christian faith as he conceived it; and it is impossible to say that he conceived it amiss. For all his overmastering zeal he was by nature neither a bigot nor a persecutor. Even when he was preaching the crusade he interfered at Mainz to stop the persecution of the Jews, stirred up by the monk Rudolf. As for heretics, "the little foxes that spoil the vines," these "should be taken, not by force of arms, but by force of argument," though, if any heretic refused to be thus taken, he considered "that he should be driven away, or even a restraint put upon his liberty, rather than that he should be allowed to spoil the vines" (Serm. lxiv.). He was evidently troubled by the mob violence which made the heretics "martyrs to their unbelief." He approved the zeal of the people, but could not advise the imitators of their action, "because faith is to be produced by persuasion, not imposed by force"; adding, however, in the true spirit of his age and of his church, "it would without doubt be better that they should be coerced by the sword than that they should be allowed to draw away many other persons into their error." Finally, oblivious of the precedent of the Pharisées, he ascribes the steadfastness of these "dogs" in facing death to the power of the devil (Serm. lxvi. on Canticles ii. 15).

This is Bernard at his worst. At his best—and, fortunately, this is what is mainly characteristic of the man and his writings—he displays a nobility of nature, a wise charity and tenderness in his dealings with others, and a genuine humility, with no touch of servility, that make him one of the most complete exponents of the Christian life. His broadly Christian character is, indeed, witnessed to by the enduring quality of his influence. The echoes which have come down from his writings, the reformers saw in him a medieval champion of their favourite doctrine of the supremacy of the divine grace; his works, down to the present day, have been reprinted in countless editions. This is perhaps due to the fact that the chief fountain of his own inspiration was the Bible. He was saturated in its language and in its spirit; and though he read it, as might be expected, uncritically, and interpreted its plain meanings allegorically—as the fashion of the day was—it saved him from the grosser aberrations of medieval Catholicism. He accepted the teaching of the church as to the reverence due to our Lady and the saints, and on feast-days and festivals those receive their due meed in his sermons; but in his letters and sermons their names are at other times seldom invoked. They were overshadowed completely in his mind by the idea of the grace of God and the moral splendour of Christ; "from Him do the Saints derive the odour of sanctity; from Him also do they shine as lights" (Ep. 464).

The cause of Bernard's extraordinary popular success as a preacher can only imperfectly be judged by the sermons that survive. These were all delivered in Latin, evidently to congregations more or less on his own intellectual level. Like his letters, they are full of quotations from and reference to the Bible, and they have all the qualities likely to appeal to men of culture at all times. "Bernard," wrote Erasmus in his Art of Preaching, "is an eloquent preacher, much more by nature than by art; he is full of charm and vivacity and knows how to reach and move the affections." The same is true of the letters and to an even more striking degree. They are written on a large variety of subjects, great and small, to people of the most diverse stations and types; and they help us to understand the adaptable nature of the man, which enabled him to appeal as successfully to the unlearned as to the learned.

Bernard's works fall into three categories: (i) Letters, of which over five hundred have been preserved, of great interest and value for the history of the period. (2) Treatises: (a) dogmatic and polemical, De gratia et libero arbitrio, written about 1127, and following closely the lines laid down by St Augustine; De baptismo alias interrogations ad mag. Hagunem de S. Victore; (b) more intellectual and philosophical, De operatione et dispositione, written about 1130; (c) a biography of St Bernard, written about 1137 to William, abbot of St Thierry; De laude novae militiae ad milites templi (c. 1133–1136); De precepto et dispensatione, an answer to various questions on monastic conduct and discipline addressed to him by the monks of St Peter at Chartres (some time before 1143); (d) on ecclesiastical government, De moribus et officio episcoporum, written about 1126 for Henry, bishop of Sens; the De Consideratione mentioned above; (e) a biography, De vita et rebus gestis S. Malachiae, Hibertus episcopo, written at the request of the Irish abbot Congan and with the aid of materials supplied by him; it is of importance for the ecclesiastical history of Ireland in the 12th century; (f) sermons—divided into Sermones de tempore; de sanctis; de diversis; and eighty-six sermons, in Centaia Canticonorum, an allegorical and mystical exposition of the Song of Solomon; (g) hymns. Many hymns ascribed to Bernard survive, e.g. Jesu dulcis memoria, Jesus rex admirabilis, Jesu decus angelicum, Salve caput cruentatum. Of these the first three are included in the Roman breviary. Many have been translated and are used in Protestant churches.

St Bernard's works were first published in anything like a complete edition at Paris in 1528, under the title Seraphica melliflui denotatiae doctoris S. Bernardi scripta, edited by Andre Bocard; the first really critical and complete edition is that of Dom J. Mabillon Sancti Bernardi opp. Ser. (Paris, 1667, improved and enlarged in 1694, and again, by Massuet and Tixer, in 1719), edited by J. P. Migne, Patrolog. lat. (Paris, 1859). There is an English translation of Mabillon's edition, including, however, only the letters and the sermons on the Song of Songs, with the biographical and other prefaces, by Samuel J. Eales (4 vols., London, 1889–1895). See further Leopold Janauschek,
BERNARD OF CHARTRES—BERNARD, J.

BERNARD, CLAUDE (1813-1878), French physician, was born on the 12th of July 1813 in the village of Saint-Julien near Villegouge. He received his early education in the Jesuit school of that town, and then proceeded to the college at Lyons, which, however, he soon left to become assistant in a druggist's shop. His leisure hours were devoted to the composition of a vaudeville comedy, La Rose du Rhône, and the success it achieved moved him to attempt a prose drama in five acts, Arthur de Bretagne.

At the age of twenty-one he went to Paris, armed with this play and an introduction to Saint-Marc Girardin, but the critic dissuaded him from adopting literature as a profession, and urged him rather to take up the study of medicine. This advice he followed, and in due course became interne at the Hôtel Dieu. In this way he was brought into contact with the great physiologist, F. Magendie, who was physician to the hospital, and whose official préparateur at the Collège de France he became in 1841. Six years afterwards he was appointed his deputy-professor at the college, and in 1855 he succeeded him as full professor. Some time previously he had been chosen the first occupant of the newly-instituted chair of physiology at the Sorbonne. There no laboratory was provided for his use, but Napoleon III. after an interview with him in 1864, supplied the necessary funds at the natural history museum in the Jardin des Plantes, and establishing a professorship, which Bernard left the Sorbonne to accept in 1868—the year in which he was a member of the Institute. He died in Paris on the 10th of February 1878 and was accorded a public funeral—an honour which had never before been bestowed by France on a man of science.

Claude Bernard's first important work was on the functions of the pancreas gland, the juice of which he proved to be of great significance in the process of digestion; this achievement won him the prize for experimental physiology from the Academy of Sciences. A second investigation—perhaps his most famous—was on the glycogenic function of the liver; in the course of this he was led to the conclusion, which throws light on the causation of diabetes, that the liver, in addition to secreting bile, is the seat of an "internal secretion," by which it prepares sugar at the expense of the elements of the blood passing through it. A third research resulted in the discovery of the vaso-motor system. While engaged, about 1857, in examining the effects produced in the temperature of various parts of the body by section of the nerve or nerves belonging to them, he noticed that division of the cervical sympathetic gave rise to more active circulation and more forcible pulsation of the arteries in certain parts of the head, and a few months afterwards he observed that electrical excitation of the upper portion of the divided nerve had the contrary effect. In this way he established the existence of vaso-motor nerves—both vaso-dilator and vaso-constrictor. The study of the physiological action of poisons was also a favourite one with him, his attention being devoted in particular to curare and carbon monoxide gas. The earliest announcements of his results, the most striking of which were obtained in the ten years from about 1850 to 1860, were generally made in the recognized scientific publications; but the full exposition of his views, and even the statement of some of the original facts, can only be found in his published lectures. The various series of these have been collected into two volumes. He also published Introduction à la médecine expérimentale (1865), and Physiologie générale (1872).

An English Life of Bernard, by Sir Michael Foster, was published in London in 1899.

BERNARD, JACQUES (1658-1718), French theologian and publicist, was born at Nions in Dauphiné on the 1st of September 1658. Having studied at Geneva, he returned to France in 1679, and was chosen minister of Venterol in Dauphiné, whence he afterwards removed to the church of Vinsores. As he continued to preach the reformed doctrines in opposition to the royal ordinance, he was obliged to leave the country and retired to Holland; where he was well received and appointed one of the pensionary ministers of Gouda. In July 1686 he commenced his Histoire abrégée de l'Europe, which he continued monthly till
BERNARD, M.----BERNAY

December 1688. In 1692 he began his Lettres historiques, containing an account of the most important transactions in Europe; he carried on this work till the end of 1698, after which it was continued by others. When Le Clerc discontinued his Bibliothèque universelle in 1691, Bernard wrote the greater part of the twentieth volume and the five following volumes. In 1698 he collected and published Actes et négociations de la paix de Ryswick, in four volumes 12mo. In 1699 he began a continuation of Bayle's Nouvelles de la république des lettres, which continued till December 1710. In 1705 he was unanimously elected one of the ministers of the Walloon church at Leiden; and about the same time he succeeded M. de Valer in the chair of philosophy and mathematics at Leiden. In 1716 he published a supplement to Moreri's dictionary, in two volumes folio. The same year he resumed his Nouvelles de la république des lettres, and continued it till his death, on the 27th of April 1718. Besides the works above mentioned, he was the author of two practical treatises, one on late repentance (1712), the other on the excellence of religion (1714).

BERNARD, MONTAIGNE (1530-1682), English international lawyer, the third son of Charles Bernard of Jamaica, the descendant of a Huguenot family, was born at Tibberton Court, Gloucestershire, on the 28th of January 1830. He was educated at Sherborne school, and Trinity College, Oxford. Graduating B.A. in 1642, he took his B.C.L. He was educated Vinerian scholar and fellow, and having read in chambers with Roundell Palmer (afterwards Lord Selborne), was called to the bar at Lincoln's Inn in 1846. He was specially interested in legal history and in church questions, and was one of the founders of the Guardian.

In 1852 he was elected to the new professorship of international law and diplomacy at Oxford, attached to All Souls' College, of which he afterwards was made a fellow. But besides his duties at Oxford he undertook a good deal of non-collegiate work; he was a member of several royal commissions; in 1871 he went as one of the high commissioners to the United States, and signed the treaty of Washington, and in 1872 he assisted Sir Roundell Palmer before the tribunal of arbitration at Geneva. In 1874 he resigned his professorship at Oxford, but as member of the university of Oxford commission of 1876 he was mainly responsible for bringing about the compromise ultimately adopted between the university and the colleges. Bernard's reputation as an international lawyer was widespread, and he was an original member of the Institut de Droit International (1873). His published works include An Historical Account of the Neutrality of Great Britain during the American Civil War (1861-1865), and many lectures on international law and diplomacy.

BERNARD, SIMON (1710-1830), French general of engineers, was born at Dôle, educated at the École Polytechnique, and entered the army in the corps of engineers. He rose rapidly, and served (1805-1812) as aide-de-camp to Napoleon. He was wounded in the retreat after Leipzig, and distinguished himself the same year (1813) in the gallant defence of Torgau against the allies. After the emperor's fall he emigrated to the United States, where, being made a brigadier-general of engineers, he executed a number of extensive military works for the government, notably at Fortress Monroe, Va., and around New York, and did a large amount of the civil engineering connected with the Chesapeake and Ohio Canal and the Delaware Breakwater. He returned to France after the revolution of 1830, was made a lieutenant-general by Louis Philippe, and in 1836 served as minister of war.

BERNARD, SIR THOMAS, Bart. (1750-1818), English social reformer, was born at Lincoln on the 27th of April 1750, the younger son of Sir Francis Bernard, 1st bart. (1711-1770), who was responsible for directing the British policy which led to the revolt of the American colonies. On the death of his elder brother in 1810, Bernard succeeded to the baronetcy conferred on his father in 1760. His early education was obtained in America, partly at Harvard, in which college his father took a great interest. He then acted as confidential secretary to his father during the troubles which led (1769) to the governor's recall, and accompanied Sir Francis to England, where he was called to the bar, and practised as a conveyancer. He married a rich wife, and acquired a considerable fortune, and then devoted most of his time to social work for the benefit of the poor. He was treasurer of the Foundling Hospital, in the concern of which he took an important part. He helped to establish in 1766 the "Society for Bettering the Condition and Increasing the Comforts of the Poor," in 1800 a school for indigent blind, and in 1801 a fever institution. He was active in promoting vaccination, improving the conditions of child labour, advocating rural allotments, and agitating against the salt duties. He took great interest in education, and with Count Rumford he was an originator of the Royal Institution in London. He died without issue on the 1st of July 1818.

BERNARDIN OF Siena, ST (1380-1444), Franciscan friar and preacher, was born of a noble family in 1380. His parents died in his childhood, and on the completion of his education he spent some years in the service of the sick in the hospitals, and thus caught the plague, of which he nearly died. In 1402 he entered the Franciscan order in the strict branch called Observants, of which he became one of the chief promoters (see FRANCISCANS). Shortly after his profession he the work of preaching with unusual success and for more than 40 years he preached with wonderful effect all over Italy, and played a great part in the religious revival of the beginning of the 15th century. In 1437 he became vicar-general of the Observant branch of the Franciscans. He refused three bishoprics. He died in 1444 at Aquila in the Abruzzi, and was canonized in 1450.

The first edition of his works, for the most part elaborate sermons, was printed at Lyons in 1501; later others in 1563, 1650 and 1745. His Life was first found in the Bollandists and in Les Événements of May 29th, and a modern biography has been written by Paul Thureau-Dangin (1860), and translated into English by Gertrude von Hügel (1896).

BERNAUER, AGNES (d. 1433), daughter of an Augsburg baker, was secretly married about 1432 to Albert (1401-1460), son of Ernest, duke of Bavaria-Munich. Ignorant of the fact that this union was a lawful one, Ernest urged his son to marry, and reproached him with his connexion with Agnes. Albert then declared she was his lawful wife; and subsequently, during his absence, she was seized by Duke Ernest and condemned to death for witchcraft. On the 12th of October 1435 she was drowned in the Danube near Straubing, in which town the story of the case is related. She is still drunk among the memory of the people, and her chief interest lies in her literary associations. It has afforded material for several dramas, and Adolf Böttger, Friedrich Hebbel and Otto Ludwig have each written one entitled Agnes Bernauer.

BERNAY, a town of north-western France, capital of an arrondissement in the department of Eure, on the left bank of the Chaurenton, 31 m. W.W. of Evreux, on the Western railway between that town and Lisieux. Pop. (1906) 5973. It is beautifully situated in the midst of green wooded hills, and still justifies Madame de Stael's description of it as "a basket of flowers." Of great antiquity, it possesses numerous quaint wooden houses and ancient ecclesiastical buildings of considerable interest. The abbey church is now used as a market, and the abbey, which was founded by Judith of Brittany early in the 11th century, and underwent a restoration in the 17th century, serves for municipal and legal purposes. The church of Ste Croix, which has a remarkable marble figure of the infant Jesus, dates from the 14th and 15th centuries, that of Notre-Dame de Couture, which preserves some good stained glass, from the 14th and 15th centuries, and has a superb interior, a communal college, tribunals of commerce and of first instance, and a board of trade-arbitrators. Among the industrial establishments of the place are manufactories of cotton and woollen goods, bleachers and dye-works. Large numbers of Norman horses are sold in Lent, at the fair known as the Foire fleurie, and there is also a trade in grain. Bernay grew up round the Benedictine abbey mentioned above, and early in the 13th century was the seat of a viscount. The town, formerly fortified
was besieged by Bertrand du Guesclin, constable of France, in 1378; it was taken several times by the English during the first half of the 15th century, and by Admiral de Coligny in 1563. The fortress was razed in 1589.

**BERNAYS, Jakob** (1824–1881), German philologist and philosophical writer, was born at Hamburg of Jewish parents on the 11th of September 1824. His father, Isaac Bernays (1792–1849), a man of wide culture, was the first orthodox German rabbi to preach in the vernacular. Jakob studied from 1844 to 1848 at the university of Bonn, the philological school of which, under Welcker and Ritschl (whose favourite pupil Bernays became), was the best in Germany. In 1853 he accepted the chair of classical philology at the newly founded Jewish theological college (the Fränkel seminary) at Breslau, where he formed a close friendship with Mommsen. In 1866, when Ritschl left Bonn for Leipzig, Bernays returned to his old university as extraordinary professor and chief librarian. He remained at Bonn until his death on the 26th of May 1881. His chief works, which deals mainly with the Greek philosophers, are:—Die Lebensbeschreibung des J. J. Scaliger (1853); Über das Phylakideon Gedicht (1856); Die Chronik des Sulpicius Severus (1861); Die Dialoge des Aristoteles im Verhältniss zu seinen übrigen Werken (1863); Theophrastos' Schrifft über Frömigkeit (1866); Die Heraklitischen Briefe (1869); Lucian und die Cyniker (1870); Zwei Abhandlungen über die Aristotelische Theorie des Dramas (1880). The last one of these was a republication of his Grundzüge der verlorenen Abhandlungen des Aristoteles über die Wirkung der Tragödie (1857), which aroused considerable controversy.

See notices in Biographisches Jahrbuch für Alterthumskunde (1881), and Allgemeine deutsche Biographie, xi. (1902); art. in Jewish Encyclopedia, also Sandi, Hist. of Class. Schol. iii. 176 (1900).

His brother, **Michael Bernays** (1834–1897), was born in Hamburg on the 27th of November 1834. He studied first law and then literature at Bonn and Heidelberg, and obtained a considerable reputation by his lectures on Shakespeare at Leipzig and an explanatory text to Beethoven's music to Egmont. Having refused an invitation to take part in the censorship of the Preussische Jahrbücher, in the same year (1866) he published his celebrated Zur Kritik und Geschichte des Goetheischen Textes. He confirmed his reputation by his lectures at the university of Leipzig, and in 1873 accepted the post of extraordinary professor of German literature at Munich specially created for him by Louis II. of Bavaria. In 1874 he became an ordinary professor, a position which he only resigned in 1889 when he settled at Carlsruhe. He died at Carlsruhe on the 25th of February 1897. At an early age he had embraced Christianity, whereas his brother Jakob remained a Jew. Among his other publications were: Briefe Goethes an F. A. Wolf (1868); Zur Enstehungsgeschichte des Schlegelschen Shakespeare (1873); an introduction to Hirzel's collection entitled *Der junge Goethe* (1873); and he edited a revised edition of Voss's translation of the Odyssey. From his literary remains were published Schriften zur Kritik und Literaturgeschichte (1895–1906).

**BERNBERG**. a town in the duchy of Anhalt, Germany, on the Saale, 29 m. N. by W. from Halle by rail, formerly the capital of the new incorporated duchy of Anhalt-Bernburg. Pop. (1900) 34,427; (1905) 34,420. It consists of four parts, the Altstadt or old town, the Bergstadt or hill town, the Neustadt or new town, and the suburb of Waldau—the Bergstadt on the right and the other three on the left of the river Saale, which is crossed by a massive stone bridge. It is a well-built city, the principal public buildings being the government house, the church of St Mary, the gymnasium and the house of correction. The castle, formerly the ducal residence, is in the Bergstadt, defended by moats, and surrounded by beautiful gardens. Bernburg is the seat of considerable industry, manufacturing machinery and boilers, sugar, pottery and chemicals, and has lead and zinc smelting. Market-gardening is also extensively carried on, and there is a large river traffic in grain and agricultural produce.

Bernburg is of great antiquity. The Bergstadt was fortified by Otto III. in the 10th century, and the new town was founded in the 13th. For a long period the different parts were under separate municipalities, the new town uniting with the old in 1560, and the Bergstadt with both in 1824. Prince Frederick removed the ducal residence to Ballenstedt in 1765.

**BERNERS, John Bourchier**, 2nd Baron (1460–1533), English translator, was born probably at Tharfield, Hertfordshire, about 1469. His father was killed at Barnet in 1471, and he inherited his title in 1474 from his grandfather, John Bourchier, who was a descendant of Edward III. It is supposed that he was educated at Oxford, perhaps at Balliol. His political life began early, for in 1484 he was implicated in a premature attempt to place Henry, duke of Richmond (afterwards Henry VII.), on the throne, and fled in consequence to Brittany. In 1497 he helped to put down an insurrection in Cornwall and Devonshire, raised by Michael Joseph, a blacksmith, and from this time was in high favour at court. He accompanied Henry VIII. to Calais in 1513, and was a captain of pioneers at the siege of Therouanne. In the next year he was again sent to France as chamberlain to the king, this time to marry with Louis XII., but he soon returned to England. He had been given the reversion of the office of lord chancellor, and in 1516 he received the actual appointment. In 1518 he was sent to Madrid to negotiate an alliance with Charles of Spain. He sent letters to Henry chronicling the bull-fights and other doings of the Spanish court, and to Wolsey complaining of the expense to which he was put in his position as ambassador. In the next year he returned to England, and with his wife Catherine Howard, daughter of the duke of Norfolk, was present in 1520 at the Field of the Cloth of Gold. But his affairs were greatly embarrassed. He was harassed by lawsuits about his Hertfordshire property and owed the king sums he was unable to repay. Perhaps in the hope of repairing his fortune, he accepted the office of deputy of Calais, where he spent the rest of his life in comparative leisure, though still harassed by his debts, and died on the 16th of March 1533.

His translation of *Sir Johan Freyousart of the Cronicles of England* and works such as *Paony*, *Portyngale*, *Scotland*, *Bretayne*, *Flandurs: and other places adjoyning*, was undertaken at the request of Henry VIII., and was printed by Richard Pynson in two volumes dated 1523 and 1525. It was the most considerable historical work that had yet appeared in English, and exercised great influence on 16th-century chroniclers. Berners tells us in his prefaces of his own love of histories of all kinds, and in the introduction to his story of Arthur of Little Britain he excises its "fayned mater" and "many unpossybylytes" on the ground that other well reputed histories are equally incredible. He goes on to excuse his deficiencies by saying that he knew himself to be unskilled in the "facundous arte of retoryke," and that he was but a "mender of the language of Frenshe." The want of rhetoric is not to be deplored. The style of his translation is clear and simple, and he rarely introduces French words or idioms. Two romances from the French followed: *The Bohke of Duke Hauke*, 1534, by Cynikyn de Worde; and *The History of the Moot stool noble and wonder knight Arthur of lytell brytasyn*. His other two translations, *The Castell of Love* (printed 1540), from the Carcel de Amor of Diego de San Pedro, and *The Golden Bohke of Marcus Aurelius* (completed six days before his death, printed 1534), from a French version of Antonio Guevarra's book, are in a different manner. The *Golden Bohke* gives Berners a claim to be a pioneer of Euphuism, although Lyly was probably acquainted with Guevara not through his version, but through Sir Thomas North's *Dial of Princes*. Berners is also credited with a book on the duties of the inhabitants of Calais, which Mr Sidney Lee thinks may be identical with the ordinance for watch and ward of Calais preserved in the Cotton MSS. and with a lost comedy, *Ile in vineam moos*, which used to be acted at Calais after vespers.

A biographical account of Berners is to be found in Mr Sidney Lee's introduction to *Hion of Bourdeaux* (Early English Text Society)
BERNERS—BERNHARDT

Of the editions of his translation of Froissart may be mentioned that in the “Tudor Translations” (1901), with an introductory critical note by Professor W. P. Ker.

BERNERS, BARNES or BERNES, JULIANA (b. 1388 ?), English writer on hawking and hunting, is said to have been in the scribal copyists of St Albans, and daughter of Sir James Berners, who was beheaded in 1388. She was probably brought up at court, and when she adopted the religious life, she still retained her love of hawking, hunting and fishing, and her passion for field sports. The only documentary evidence regarding her, however, is the statement at the end of her treatise on hunting in the Boke of St Albans, “Explicit Dam Julyns Barnes in her boke of huyntynge” (edition of 1486), and the name is changed by Wynkyn de Worde to “dame Julyns Bernes.” There is no such person to be found in the pedigree of the Berners family, and there is a gap in the records of the priory of St Albans between 1430 and 1450. Juliana Berners is the supposed author of the work generally known as the Boke of St Albans. The first and rarest edition was printed in 1486 by an unknown schoolmaster at St Albans. It has no title-page. Wynkyn de Worde's edition (fol. 1496), also without a title-page, begins:—This present boke shewyth the manere of hawkyng and huyntynge: and also of diuysynge of Cote armours. It shewyth also a good materre belongynge to horses: wyth other comendable treatises. And ferdermore, the blasynge of armes: as hereafter it may appeere.” This edition was adorned by three woodcuts, and included a “Treatise of fysynghe wyth an Angle,” not contained in the St Albans edition. J. Haslwood, who published a facsimile of that of Wynkyn de Worde (London, 1811, folio), with a biographical and bibliographical notice, examined with the greatest care the author's claims to figure as the earliest woman author in the English language. He assigned to her little else in the Boke except part of the treatise on hawking and the section on hunting. It is expressly stated at the end of the Boke of St Albans that the section was “translayd and compyllyt,” and it is likely that the other treatises are translations, probably from the French. An older form of the treatise on fishing was edited in 1883 by Mr T. Satchell from a MS. in possession of Mr A. Denison. This treatise probably dates from about 1450, and formed the foundation of that section in the book of 1496. Only three perfect copies of the first edition are known to exist. A facsimile, entitled The Book of St Albans, with an introduction by William Blades, appeared in 1881. During the 16th century the work was very popular, and was many times reprinted. It was edited by Gervase Markham in 1595 as The Gentleman's Academie. BERNHARDT, Saxe-Weimar, DUKE (1604–1639), a celebrated general in the Thirty Years' War, was the eldest son of John, duke of Saxe-Weimar. He received an unusually good education, and studied at Jena, but soon went to the court of the Saxon elector to engage in knightly exercises. At the outbreak of the Thirty Years' War he took the field on the Protestant side, and served under Mansfeld at Wieslock (1622), under the margrave of Baden at Wimpfen (1622), and with his brother William at Stadthohn (1623). Undismayed by these defeats, he took part in the campaigns of the king of Denmark; and when Christian withdrew from the struggle Bernhard went to Holland and was present at the famous siege of Hertenbosch (Bois-le-Duc) in 1629. When Gustavus Adolphus landed in Germany Bernhard quickly joined him, and for a short time he was colonel of the Swedish life guards. After the battle of Breitenfeld he accompanied Gustavus in his march to the Rhine, and, between this event and the battle of the Alte Veste, Bernhard commanded numerous expeditions in almost every district from the Moselle to the Rhine. At the Alte Veste he displayed greatest courage, and at Lützen, when Gustavus was killed, Bernhard immediately assumed the command, killed a colonel who refused to lead his men to the charge, and finally by his furious energy won the victory at sundown. At first as a subordinate to his brother William, who as a Swedish lieutenant-general succeeded to the command, but later as an independent commander, Bernhard continued to push his forays or southern Germany; and with the Swedish General Horn he made in 1633 a successful invasion into Bavaria, which was defended by the imperial general Arlending. In this year he acquired the duchy of Würtzburg, installing one of his brothers as Stadthaller, and returning to the wars. A stern Protestant, he exacted heavy contributions from the Catholic cities which he took, and his repeated victories caused him to be regarded by German Protestants as the saviour of their religion. But in 1634 Bernhard suffered the great defeat of Nördlingen, in which the flower of the Swedish army perished. In 1635 he entered the service of France, which had now intervened in the war. He was now at the same time general-in-chief of the forces maintained by the Heilbronn union of Protestant princes, and a general officer in the pay of France. This double position was very difficult; in the following campaigns, ably and resolutely conducted as they were, Bernhard sometimes pursued a purely French policy, whilst at other times he used the French mercenaries to forward the cause of the princes. From a military point of view his most notable achievements were on the common ground of the upper Rhine, in the Breisgau. In his great campaign of 1638 he won the battles of Rheinfelden, Wittenweher and Thann, and captured successively Rheinfelden, Freiburg and Breisach, the last reputed one of the strongest fortresses in Europe. Bernhard had in the first instance received definite assurances from France that he should be given Alsace and Hagenau, Würtzburg having been lost in the débâcle of 1634; he now hoped to make Breisach the capital of his new duchy. But his health was now broken. He died on the 8th of July 1639 at the beginning of the campaign, and the governor of Breisach was bribed to transfer the fortress to France. The duke was buried at Breisach, his remains being subsequently removed to Weimar.

BERNHARDT, SARAH (Rosine Bernard) (1845— ), French actress, was born in Paris on the 22nd of October 1845, of mixed French and Dutch parentage, and of Jewish descent. She was, however, baptized at the age of twelve and brought up in a convent. At thirteen she entered the Conservatoire, where she gained the second prize for tragedy in 1861 and for comedy in 1862. Her début was made at the Comédie Française on the 11th of August 1862, in a minor part in Racine's Iphigénie en Aulide, without any marked success, nor did she do much better in burlesque at the Porte St-Martin and Gymnase. In 1867 she became a member of the company at the Odéon, where she made her first definite successes as Cordelia in a French translation of King Lear, as the queen in Victor Hugo's Ruy Blas, and, above all, as Zanetto in François Coppée's Le Passant (1869). When peace was restored after the Franco-German War she left the Odéon for the Comédie Française, thereby incurring a considerable monetary forfeit. From that time she steadily increased her reputation, two of the most definite steps in her progress being her performances of Phèdre in Racine's play (1874) and of Dona Sol in Victor Hugo's Hernani (1877). In 1879 she had a famous season at the Gaiety in London. By this time her position as the greatest actress of her day was securely established. Her amazing power of emotional acting, the extraordinary realism and pathos of her death-scenes, the magnetism of her personality, and the beauty of her "voix d'or," made the public tolerant of her occasional caprices. She had developed some skill as a sculptor, and exhibited at the Salon at various times between 1876 (honourable mention) and 1881. She published a life of herself in 1880. In 1878 she published a prose sketch, Dans les nuages; les impressions d'une chaise. Her comedy L'Auvray was produced in 1888 at the Odéon with much success. Her relations with the other sociétés of the Comédie Française having become somewhat strained, a crisis arrived in 1880, when, enraged by an unfavourable criticism of her acting, she threw up her position on the day following the first performance of Emile Augier's L'Aventurire. This obliged her to pay a forfeit of 5,000 for breach of contract.
BERHARDY—BERNICKIAN SERIES

Immediately after the rupture she gave a series of performances in London, relying chiefly upon Scribe and Legouvé's Adrienne Lecouvreur, and Racine, and in 1886-1887, with La Dame aux camélias as the principal attraction. These were followed by tours in Denmark, America and Russia, during 1886 and 1887, with La Dame aux camélias as the principal attraction. After a fresh triumph in Paris with Sardou's Fédora at the Vaudeville, she became proprietress of the Théâtre St-Martin. Jean Richépin's Nana Sahib (1883), Sardou's Théodora (1884) and La Tosca (1887), Jules Barbier's Jeanne d'Arc (1890) and Sardou and Moreau's Chéopatre (1890) were among her most conspicuous successes here, where she remained till she became proprietress of the Renaissance theatre in 1893. During those ten years she made several extended tours, including visits to America in 1886-1887, 1888-1889, and 1891 and 1893 she again visited America (North and South), Australia, and the chief European capitals. In November 1893 she opened the Renaissance with Les Rois by Jules Lemaître, which was followed by Sylvestre and Morand's L'Izéyl (1894), Sardou's Génissone (1894) and Edmond Rostand's La Princesse lointaine (1895). In 1895 she also appeared with conspicuous success as Magda in a French translation of Sudermann's Heimath. For the next few years she visited London almost annually, and America in 1896. In that year she made a success with an adaptation of Alfred de Musset's Lorenzaccio. In Easter week of 1897 she played in a religious drama, La Samaritaine, by Rostand. In December 1896 an elaborate fête was organized in Paris in her honour; and the value of this public recognition of her position at the head of her profession was enhanced by cordial greetings from all parts of the world. By this time she had played one hundred and twelve parts, thirty-eight of which she had created. Early in 1899 she removed from the Renaissance to the Théâtre des Nations, a larger house, which she opened with a revival of La Tosca. In the same year she made the bold experiment of a French production of Hamlet in Paris; she played the title part. She repeated the impersonation in London not long afterwards, where she also appeared (1901) as the fate-ridden son of Napoleon I., in Rostand's L'Aiglon, which had been produced in Paris the year before. Of the successful productions of her later years perhaps none was more remarkable than her impersonation of La Tsibbé in Victor Hugo's romantic drama Angelo (1905).

See Jules Huret, Sarah Bernhardt (1889); and her own volume of autobiography (1907).

BERNHARDY, GOTTFRIED (1800-1875), German philologist and literary historian, was born on the 20th of March 1800, at Landsberg on the Wartha, in Brandenburg. He was the son of Jewish parents in reduced circumstances. Two well-to-do uncles provided the means for his education, and in 1811 he entered the Joachimsthal gymnasium at Berlin. In 1817 he went to Berlin University to study philology, where he had the advantage of hearing F. A. Wolf (then advanced in years), August Beger and P. F. Tschirnhaus, who took the degree of doctor of philosophy at Berlin, and in 1825 became extraordinary professor. In 1829 he succeeded C. Reisig as ordinary professor and director of the philological seminary at Halle, and in 1844 was appointed chief librarian of the university. He died suddenly on the 14th of May 1875. The most important of Bernhardy's works were his histories (or sketches) of Greek and Roman literature; Grundriss der römischen Literatur (5th ed., 1872); Grundriss der griechischen Literatur (pt. i., Introduction and General View, 1836; pt. ii., Greek Poetry, 1845; pt. iii., Greek Prose Literature, was never published). A fifth edition of pts. i. and ii., by R. Vollmann, began in 1852. Other works by Bernhardy are: Erstatischehenica (1822); Wissenschaftliche Syntax der griechischen Sprache (1829, supplts. 1854, 1862); Grundlinien zur Encyclopädie der Philologie (1832); the monumental edition of the Lexicon of Suidas (1834-1853); and an edition of F. A. Wolf's Kleine Schriften (1869).

See Vollmann, G. Bernhardy (1887).

BERNI, FRANCESCO (1497-1536), Italian poet, was born about 1497 at Lamporecchio, in Bibbiena, a district lying along the Upper Arno. His family was of good descent, but exceedingly poor. At an early age he was sent to Florence, where he remained till his 15th year. He then set out for Rome, trusting to obtain some assistance from his uncle, the Cardinal Bibiena. The cardinal, however, did nothing for him, and he was obliged to accept a situation as clerk or secretary to Ghiberti, datary to Clement VII. The duties of his office, for which Berni was in every way unfit, were exceedingly irksome to the poet, who, however, made himself celebrated at Rome as the most witty and inventive of a certain club of literary men, who devoted themselves to light and sparkling effusions. So strong was the admiration for Berni's verses, that mocking or burlesque poems have since been called poesie basse. About the year 1530 he was relieved from his servitude by obtaining a canonry in the cathedral of Florence. In that city he died in 1536, according to tradition by poison, by Duke Alessandro de' Medici, for having refused to poison the duke's cousin, Ippolito de' Medici; but considerable obscurity rests over this story. Berni stands at the head of the Italian comic or burlesque poets. For lightness, sparkling wit, variety of form and fluent diction, his verses are unsurpassed. Perhaps, however, he owes his life, but not the recasting (Rifacimento) of Boiardo's Orlando Innamorato. The enormous success of Ariosto's Orlando Furioso had directed fresh attention to the older poem, from which it took its characters, and of which it is the continuation. But Boiardo's work, though good in plan, could never have achieved wide popularity on account of the extreme ruggedness of its style. Berni undertook the revision of the whole poem, avereadly altering no sentiment, removing or adding no incident, but simply giving to each line and stanza due gracefulness and polish. His task he completed with marvellous success; scarcely a line remains as it was, and the general opinion has pronounced decisively in favour of the revision over the original. To each canto he prefixed a few stanzas of reflective verse in the manner of Ariosto, and in one of these introductions he gives us the only certain information we have concerning his own life. Berni appears to have been favourably regarded by the popes; his name is prefixed to the Italian translation of the Iliad in the 16th century introduced into Italy, and this may explain the bitterness of some remarks of his upon the church. The first edition of the Rifacimento was printed posthumously in 1541, and it has been supposed that a few passages either did not receive the author's final revision, or have been retouched by another hand.

A partial translation of Berni's Orlando was published by W. S. Rose (1823).

BERNICTIAN SERIES, in geology, a term proposed by S. P. Woodward in 1856 (Manual of Mollusca, p. 400) for the lower portion of the Carboniferous System, below the Millstone Grit. The name was suggested by that of the ancient province of Bernicia on the Anglo-Scottish borderland. It is practically equivalent to the "Dinantien" of A. de Lapparent and Munier-Chalmas (1893). In 1875 G. Tate's "Calcareous and Carbonaceous" groups of the Carboniferous Limestone series of Northumberland were united by Professor Lebour into a single series, to which he applied the name "Bernician"; but later he speaks of the whole of the Carboniferous rocks of Northumberland and its
BERNINI—BERNOULLI

803

borders as of the "Bernician type," which is the most satisfactory way in which the term may now be used (Report of the Brit. Sub-committee on Classification and Nomenclature, 2nd ed., Cambridge, 1885). "Demelian" was the corresponding designation proposed by Woodward for the Upper Carboniferous rocks.

BERNINI, GIOVANNI LORENZO (1568-1680). Italian artist, was born at Naples. He was more celebrated as an architect and a sculptor than as a painter. At a very early age his great skill in modelling introduced him to court favour at Rome, and he was specially patronized by Maffeo Barberini, afterwards Pope Urban VIII., whose palace he designed. None of his sculptured groups at all come up to the promised excellence of his first effort, the Apollo and Daphne, nor are any of his paintings of particular merit. His busts were in such request that Charles I. of England, being unable to have a personal interview with Bernini, sent him three portraits by Vandyck, from which the artist was enabled to complete his model. His architectural designs, including the great colonnade of St. Peter's, brought him perhaps his greatest celebrity. Louis XIV., when he contemplated the restoration of the Louvre, sent for Bernini, but did not adopt his designs. The artist's progress in France was a triumphal procession, and he was most liberally rewarded by the great monarch. He left a fortune of over £100,000.

BERNIS, FRANÇOIS JOACHIM DE PIERRE DE (1715-1794). French cardinal and statesman, was born at St Marceau-l'Arîdêche on the 22nd of May 1715. He was of a noble but impoverished family, and, being a younger son, was intended for the church. He was educated at the Louis-le-Grand college and the seminary of Saint-Sulpice, Paris, but did not take orders till 1755. He became known as one of the most expert epigrammatists in the gay society of Louis XV.'s court, and by his verses won the friendship of Madame de Pompadour, the royal mistress, who obtained for him an apartment, furnished at her expense, in the Tuileries, and a yearly pension of 1200 livres (about £60). In 1751 he was appointed to the French embassy at Venice, where he acted, to the satisfaction of both parties, as mediator between the republic and Pope Benedict XIV. During his stay in Venice he received subdeacon's orders, and on his return to France in 1755 was made a papal councillor of state. He took an important part in the delicate negotiations between France and Austria, which preceded the Seven Years' War. He regarded the alliance purely as a temporary expedient, and did not propose to employ the whole forces of France in a general war. But he was overruled by his colleagues. He became secretary for foreign affairs on the 27th of June 1757, but owing to his attempts to counteract the spendthrift policy of the marquise de Pompadour and her creatures, he fell into disgrace and was in December 1758 banished to Soissons by Louis XV., where he remained in retirement for six years. In the previous November he had been created cardinal by Clement XIII. On the death of the royal mistress in 1764, Bernis was recalled and once more offered the seals of office, but declined them, and was appointed archbishop of Albi. His occupancy of the see was not of long duration. In 1769 he went to Rome to assist at the conclave which resulted in the election of Clement XIV., and the talent which he displayed on that occasion procured him the appointment of ambassador in Rome, where he spent the remainder of his life. He was partly instrumental in bringing about the suppression of the Jesuits, and acted with greater moderation than is generally supposed. He lost his influence under Pius VI., who was friendly to the Jesuits, and the French Revolution, to which he was hostile, reduced him almost to penury; the court of Spain, however, mindful of the support he had given to their ambassador in obtaining the condemnation of the Jesuits, came to his relief with a handsome pension. He died at Rome on the 3rd of November 1794, and was buried in the church of S. Luigi de' Francesi.

In 1803 his remains were transferred to the cathedral at Nîmes. His poems, the longest of which is Le Religion ténèbre (Parma, 1794), have no merit; they were collected and published after his death (Paris, 1797, &c.); his Mémoires et lettres 1715-58 (2 vols., Paris, 1878) are still interesting to the historian.

See Frédéric Masson's prefaces to the Mémoires et lettres, and Le Cardinal de Bernis depuis son ministère (Paris, 1884); E. J. de Goncourt, Mme de Pompadour (Paris, 1888), and Sainte-Beuve, Causes de lundi, t. viii.

BERNKADEL, a town of Germany, in the Prussian Rhine province, on the Mosel, in a deep and romantic valley, connected by a branch to Wengersol with the main Trier-Coblenz railway. Pop. 13,053. It is in some important manufactures; the chief industry is in wine, of which Bernkastel Doctor enjoys great repute. Above the town lie the ruins of the castle Landshut. Bernkastel originally belonged to the chapter of Trier, and received its name from one of the provosts of the cathedral, Adalbero of Luxemburg (hence Adalberonis castellum).

BERNOULLI, or BERNOLLI, the name of an illustrious family in the annals of science, who came originally from Antwerp. Driven from their country during the oppressive government of Spain for their attachment to the Reformed religion, the Bernoulis sought first an asylum at Frankfort (1583), and afterwards at Basel, where they ultimately obtained the highest distinctions. In the course of a century eight of its members successfully cultivated various branches of mathematics, and contributed powerfully to the advance of science. The most celebrated were Jacques (James), Jean (John) and Daniel, the first, second and fourth as dealt with below; but, for the sake of perspicuity they may be considered as nearly as possible the one family. A complete commentary of the great developments of mathematical learning, which the members of this family effected, lies outside the scope of this notice. More detailed accounts are to be found in the various mathematical articles.

I. JACQUES BERNOLLI (1664-1705), mathematician, was born at Basel on the 27th of December 1664. He was educated at the public school of Basel, and also received private instruction from the learned Hofmann, then professor of Greek. At the conclusion of his philosophical studies at the university, some geometrical figures, which fell in his way, excited in him a passion for mathematical pursuits, and in spite of the opposition of his father, who wished him to be a clergyman, he applied himself in secret to his favourite science. In 1667 he visited Geneva on his way to France, and subsequently travelled to England and Holland. While at Geneva he taught a blind girl several branches of science, and also how to write; and this led him to publish a Method of Teaching Mathematics to the Blind. At Breda or his University of Dillingen were constructed, and in 1676 he was admitted to the meetings of Robert Boyle, Robert Hooke and other learned and scientific men. On his return from Basel in 1682, he devoted himself to physical and mathematical investigations, and opened a public seminary for experimental physics. In the same year he published his essay on comets, Commen Noui Systematis Cometarum, which was occasioned by the appearance of the comet of 1680. This essay, and his next publication, entitled De Gravitate Aetheris, were deeply tinged with the philosophy of René Descartes, but they contain truths not unworthy of the philosophy of Sir Isaac Newton's Principia.

Jacques Bernoulli cannot be strictly called an independent discoverer; but, from his extensive and successful application of the calculus and other mathematical methods, he is deserving of a place by the side of Newton and Leibnitz. As an additional claim to remembrance, he was the first to solve Leibnitz's problem of the isochronous curve (Area Eratosthensian, 1680). He proposed the solution of the catenary (arc.) or curve formed by a chain suspended by two extremities, accepted Leibnitz's construction of the curve and solved more complicated problems relating to it. He determined the "elastic curve," which is formed by an elastic plate or rod fixed at one end and bent by a weight applied to the other, and which he showed to be the same as the curve of an impervious sail filled with a liquid (linetaria). In his investigations respecting cycloidal lines and various spiral curves, his attention was directed to the loxodromic and logarithmic spirals, in the last of which he took particular interest from its remarkable property of reproducing itself under a variety of conditions.
In 1696 he proposed the famous problem of isoperimetrical figures, and offered a reward for its solution. This problem engaged the attention of British as well as continental mathematicians; and its proposal gave rise to a painful quarrel with his brother Jean. Jean offered a solution of the problem; his brother pronounced it to be wrong. Jean then amended his solution, and again offered it, and claimed the reward. Jacques still declared it to be no solution, and soon after published his own. In 1701 he published also the demonstration of his solution, which was accepted by the marquis de l'Hôpital and Leibnitz. Jean, however, held his peace for several years, and then dishonestly published, after the death of Jacques, another incorrect solution; and not until 1718 did he admit that he had been in error. Even then he set forth as his own his brother's solution purposely disguised.

In 1687 the mathematical chair of the university of Basel was conferred upon Jacques. He was once made rector of his university, and had other distinctions bestowed on him. He and his brother Jean were the first two foreign associates of the Academy of Sciences of Paris; and, at the request of Leibnitz, they were both received as members of the academy of Berlin. In 1684 he had been offered a professorship at Heidelberg; but his marriage with a lady of his native city led him to decline the invitation. Intense application brought on infirmities and a slow fever, of which he died on the 16th of August 1705. Like another Archimedes, he requested that the logarithmic spiral should be engraved on his tombstone, with these words, *Eadem mutata resurgo.*

Jacques Bernoulli wrote elegant verses in Latin, German and French; but although these were held in high estimation in his own time, it is on his mathematical works that his fame now rests. These are:—Jacobii Bernulli Basilisii Opera (Genevæ, 1744). 2 tom. 4to; Ars Conjectandi, opus posthumum: accedit tractatus de Seriis Infinitis, et epistola (Gallice scripta) de Ludo Piae Reticularis (Basiliiæ, 1713), 1 tom. 4to.

II. JEAN BERNULLI (1667-1748), brother of the preceding, was born at Basel on the 27th of July 1667. After finishing his literary studies he went to Neapel to learn commerce, and to acquire the French language. But at the end of a year he renounced the pursuits of commerce, returned to the university of Basel, and was admitted to the degree of bachelor in philosophy; and a year later, at the age of 18, to that of master of arts. In his studies he was aided by his elder brother Jacques. Chemistry, as well as mathematics, seems to have been the object of his early attention; and in the year 1690 he published a dissertation on effervescence and fermentation. The same year he went to Geneva, where he gave instruction in the differential calculus to Nicolas Fatio de Duillier, and afterwards proceeded to Paris, where he enjoyed the society of N. Malébranche, J. D. Cassini, Philip de Lahire and Pierre Varignon. With the marquis de l'Hôpital he spent four months studying higher geometry and the resources of the new calculus. His independent discoveries in mathematics are numerous and important. Among these were the exponential calculus, and the curve called by him the *linea logarithmica* or line of swiftest descent, which he was the first to determine, pointing out at the same time the relation which this curve bears to the path described by a ray of light passing through strata of variable density. On his return to his native city he studied medicine, and in 1694 took the degree of M.D. Although he had declined a professorship in Germany, he now accepted an invitation to the chair of mathematics at Groningen (Commercium Philosophicum, epist. xi. and xii.). There, in addition to the learned lectures by which he endeavoured to revive mathematical science in the university, he gave a public course of experimental physics. During a residence of ten years in Groningen, his controversies were almost as numerous as his discoveries. His dissertation on the "barometric light," first observed by Jean Picard, and discussed by Jean Bernoulli under the name of mercurial phosphorus, or mercury shining in vacuo (Diss. physica de mercuro lucente in vacuo), procured him the notice of royalty, and engaged him in controversy. Through the influence of Leibnitz he received from the king of Prussia a gold medal for his supposed discoveries; but Nicolaus Harsseker and some of the French academicians disputed the fact. The family quarrell about the problem of isoperimetrical figures above mentioned began about this time. In his dispute with his brother, in his controversies with the English and Scottish mathematicians, and in his harsh and jealous bearing to his son Daniel, he showed a mean, unfair and violent temper. He had declined, during his residence at Groningen, an invitation to Utrecht, but accepted in 1705 the mathematical chair in the university of his native city, vacant by the death of his brother Jacques; and here he remained till his death. His inaugural discourse was on the "new analysis," which he so successfully applied in investigating various problems both in pure and applied mathematics.

He was several times a successful competitor for the prizes given by the Academy of Sciences of Paris; the subjects of his essays being—the laws of motion (Discours sur les lois de la communication du mouvement, 1727), the elliptical orbits of the planets, and the inclinations of the planetary orbits (Essai d'une nouvelle physique céleste, 1735). In the last case his son Daniel divided the prize. Some years after his return to Basel he published an essay, entitled Nouvelle Théorie de la manœuvre des vaisseaux. It is, however, his works in pure mathematics that are the permanent monuments of his fame. Jean le Rond d'Alembert acknowledges with gratitude, that "whatever he knew of mathematics he owed to the works of Jean Bernoulli." He was a member of almost every learned society in Europe, and one of the first mathematicians of a mathematical age. He was as keen in his resentments as he was ardent in his friendships; fondly attached to his family, he yet disliked a deserving son; he gave full praise to Leibnitz and Leonhard Euler, yet was blind to the excellence of Sir Isaac Newton. Such was the vigour of his constitution that he continued to pursue his usual mathematical studies till the age of eighty. He was then attacked by a complaint at first apparently trifling; but his strength daily and rapidly declined till the 1st of January 1748, when he died peacefully in his sleep.

His writings were collected under his own eye by Gabriel Cramer, professor of mathematics at Geneva, and published under the title of Johannis Bernulli Operi Omnia (Lausannæ et Genevæ), 4 tom. 4to; his interesting correspondence with Leibnitz appeared under the title Lettres de Jean et Daniel Bernulli (Utrecht, 1706); and his Commercialis and Mathematici (Lausannæ, 1730, 3 tom. 4to).

III. NICOLAS BERNULLI (1665-1726), the eldest of the three sons of Jean Bernoulli, was born on the 25th of January 1665. At the age of eight he could speak German, Dutch, French and Latin. When his father returned to Basel he went to the university of that city, where, at the age of sixteen, he took the degree of doctor in philosophy, and four years later the highest degree in law. Meanwhile the study of mathematics was not neglected, as appears not only from his giving instruction in geometry to his younger brother Daniel, but from his writings on the differential, integral, and exponential calculus, and from his father considering him, at the age of twenty-one, worthy of receiving the torch of science from his own hands. ("Lampada nunc tradam filio meo natu maximo, juventi xxi. annorum, ingenio mathematico alligis dotibus satis instructo," Com. Phil. ep. 133.) With his father's permission he visited Italy and France, and during his travels formed friendship with Pierre Varignon and Count Riccati. The invitation of a Venetian nobleman induced him again to visit Italy, where he resided two years, till his return to be a candidate for the chair of jurisprudence at Basel. He was unsuccessful, but was soon afterwards appointed to a similar office in the university of Bern. Here he resided three years, his happiness only marred by regret on account of his separation from his brother Daniel. Both were appointed at the same time professors of mathematics in the academy of St Petersburg; but this office Nicolas enjoyed for little more than eight months. He died on the 26th of July 1726 of a lingering fever. Sensible of the loss which the nation had sustained by his death, the empress Catherine ordered him a funeral at the public expense.

Some of his papers are published in his father's works, and others in the Acta Eruditorum and the Comment. Acad. Petropol.
IV. DANIEL BERNOULLI (1700–1782), the second son of Jean Bernoulli, was born on the 29th of January 1700, at Groningen. He studied medicine and became a physician, but his attention was early directed also to geometrical studies. The severity of his father's manner was ill-calculated to encourage efforts of one so sensitive; but fortunately, at the age of eleven, he became the pupil of his brother Nicolas. He afterwards studied in Italy under Francesco Domenico Michelotti and Giambattista Morgagni. After his return, though only twenty-four years of age, he was invited to become president of an academy then projected at Genoa; but, declining this honour, he was, in the following year, appointed professor of mathematics at St Petersburg. In consequence of the state of his health, however, he returned to Basel in 1733, where he was appointed professor of anatomy and botany, and afterwards of experimental and speculative philosophy. In the labours of this office he spent the remaining years of his life. He had previously published some medical and botanical dissertations, besides his Exercitaciones quaedam Mathematicae, containing a solution of the differential equation proposed by Riccati and now known by his name. In 1738 appeared his Hydrodynamica, in which the equilibrium, the pressure, and varied velocities of fluids are considered both theoretically and practically. One of these problems, illustrated by experiment, deals with an ingenious mode of propelling vessels by the reaction of water ejected from their sides. Another problem, external to this work, was proposed before Pierre Louis M. de Maupertuis and Alexis Clairaut, the name of the Bernoullis having attached to Basel. With a success equalled only by Leonhard Euler, Daniel Bernoulli gained or shared no less than ten prizes of the Academy of Sciences of Paris. The first, for a memoir on the construction of a clepsydra for measuring time exactly at sea, he gained at the age of twenty-four; the second, for one on the physical cause of the inclination of the planetary orbits, he divided with his father; and the third, for a communication on the tides, he shared with Euler, Colin MacLaurin and another competitor. The problem of vibrating cords, which had been some time before resolved by Brook Taylor (1685–1731) and d’Alembert, became the subject of a long discussion conducted in a generous spirit between Bernoulli and his friend Euler. In one of his early investigations he gave an ingenious though indirect demonstration of the problem of the parallelogram of forces. His labours in the decline of life were chiefly directed to the doctrine of probabilities in reference to practical purposes, and in particular to economical subjects, as, for example, to inoculation, and to the duration of married life in the two sexes, as well as to the relationship of numbers of male and female births. He retained his usual vigour of understanding till near the age of eighty, when his nephew Jacques relieved him of his public duties. He was afflicted with asthma, and his retirement was relieved only by the society of a few chosen friends. He died on the 17th of March 1782 at Basel. Excluded by his professional character from the councils of the republic, he nevertheless received all the deference and honour due to a first magistrate. He was wont to mention the following as the two incidents in his life which had afforded him the greatest pleasure,—that a stranger, whom he had met as a travelling companion in his youth, made to his declaration "I am Daniel Bernoulli" the incredulous and mocking reply, "And I am Isaac Newton"; and that, while entertaining König and other guests, he solved without rising from table a problem which that mathematician had submitted as difficult and lengthy. Like his father, he was a member of almost every learned society of Europe, and he succeeded him as foreign associate of the Academy of Paris.

Several of his investigations are contained in the earlier volumes of the Comment. Acad. Petropol., and his separately published works are:—Dissertatio Inaugur. Phys. Med. de Respirazione (Basil. 1721), 4to; Positiones Anatomico-Botanicae. (Basil. 1721), 4to; Exercitaciones quaedam Mathematicae (Venetii, 1724), 4to; Hydrodynamica (Argentorati, 1738), 4to.

V. JEAN BERNOULLI (1710–1790), the youngest of the three sons of Jean Bernoulli, was born at Basel on the 18th of May 1710. He studied law and mathematics, and, after travelling in France, was for five years professor of eloquence in the university of his native city. On the death of his father he succeeded him as professor of mathematics. He was twice a successful competitor for the prizes of the Academy of Sciences of Paris. His prize subjects were, the capstan, the propagation of light, and the magnet. He enjoyed the friendship of P. L. M. de Maupertuis, who died under his roof while on his way to Berlin. He himself died in 1790. His two sons, Jean and Jacques, are the last noted mathematicians of the family.

VI. NICOLAS BERNOULLI (1687–1759), cousin of the preceding, and son of Nicolas Bernoulli, one of the senators of Basel, was born in that city on the 10th of October 1687. He visited England, where he was kindly received by Sir Isaac Newton and Edmund Halley (Com. Phil. ep. 199), held for a time the mathematical chair at Padua, and was successively professor of logic and of law at Basel, where he died on the 29th of November 1759. He was editor of the Ars Conjectandi of his uncle Jacques. His own works are contained in the Acta Eruditorum, the Giornale de’ letterati d’Italia, and the Commercio Philosophicum.

VII. JEAN BERNOULLI (1744–1807), grandson of the first Jean Bernoulli, and son of the second of that name, was born at Basel on the 4th of November 1744. He studied at Basel and at Neuchâtel, and when thirteen years of age took the degree of doctor in philosophy. At nineteen he was appointed professor of mathematics in the university of Groningen, which he visited in 1763. Having been in Germany, France and England, and subsequently Italy, Russia and Poland. On his return to Berlin he was appointed director of the mathematical department of the academy. Here he died on the 13th of July 1807. His writings consist of travels and astronomical, geographical and mathematical works. In 1747 he published a French translation of Leonhard Euler’s Elements of Algebra. He contributed several papers to the Academy of Berlin.

VIII. JACQUES BERNOULLI (1759–1789), younger brother of the preceding, and the second of this name, was born at Basel on the 17th of October 1759. Having finished his literary studies, he was, according to custom, sent to Neuchâtel to learn French. On his return he graduated in law. This study, however, did not check his hereditary taste for geometry. The early lessons which he had received from his father were continued by his uncle Daniel, and such was his progress that at the age of twenty-one he was called to undertake the duties of the chair of experimental physics, which his uncle’s advanced years rendered him unable to discharge. He afterwards accepted the situation of secretary to count de Brauer, which afforded him opportunities of travel in Germany, Bohemia and Italy. In Italy he formed a friendship with Lorgna, professor of mathematics at Verona, and one of the founders of the Società Italiana for the encouragement of the sciences. He was also made corresponding member of the royal society of Turin; and, while residing at Venice, he was, through the friendly representation of Nicolaus von Fuss, admitted into the academy of St Petersburg. In 1788 he was named one of its mathematical professors.

He was tragically drowned while bathing in the Neva in July 1789, a few months after his marriage with a daughter of Albert Euler, son of Leonhard Euler.

Several of his papers are contained in the first six volumes of Nova Acta Acad. Sci. Imper. Petropol., in the Acta Helvetica, in the Memoirs of the Academies of Berlin and Turin, and in his brother’s John’s publications. He also published separately some juridical and physical theses, and a German translation of Mémoires du philosophe de Morien. See generally M. Cantor, Geschichte der Mathematik; J. C. Poggendorff, Biographisch-litterarisches Handbiicher (1859–1904).

BERNSTEIN, AARON (1812–1884), Jewish scientist, author and reformer. In the middle of the 19th century Bernstein took an active part in the movement for synagogue reform in Germany. He was the author of two delightful Ghetto stories, Vagele der Maggid and Mendel Gibbor, being one of the originators of this genre of modern fiction. He was also a publicist, and his History of Revolution and Reaction in Germany (3 vols., 1883–1884) was a collection of important political essays.
BERNSTORFF, ANDREAS PETER, COUNT VON (1735–1797),
Danish statesman, was born at Hanover on the 28th of August 1735. His career was determined by his uncle, Johann Hartwig Eberhard Bernstorff, who only left his nephews to study in the German and Swiss universities and travel for some years in Italy, France, England, and Holland, to prepare himself for a statesman's career. During these Wanderjahre he made the acquaintance of the poets Gellert and Jacobi, the learned Jean-Jacques Barthélemy, the duc de Choiseul, and Gottfried Achenwall, the statistician. At his uncle's desire he rejected the Hanoverian for the Danish service, and in 1759 took his seat in the German chancery at Copenhagen. In 1767, at the same time as his uncle, he was created a count, and in 1769 was made a privy-councillor. He is described at this period as intellectual, upright and absolutely trustworthy, but obstinate and self-opinionated to the highest degree, arguing with antiquaries about coins, with equerries about horses, and with foreigners about their own countries, always certain that he was right and they wrong, whatever the discussion might be. He shared the disgrace of his uncle when Struensee came into power, but re-entered the Danish service after Struensee's fall at the end of 1772, working at first in the financial and economical departments, and taking an especial interest in agriculture. The improvements he introduced in the tenures of his patrimony anticipated in some respects the agricultural reforms of the next generation.

In April 1773 Bernstorff was transferred to the position for which he was especially fitted, the ministry of foreign affairs, with which he combined the presidency of the German chancery (for Schleswig-Holstein). His predecessor, Adolf Siegfried Osten, had been dismissed because he was not persona grata at St Petersburg, and Bernstorff's first official act was to conclude the negotiations which had long been pending with the grand-duke Paul as duke of Holstein-Gottorp. The result was the exchange-treaty of the 1st of June (May 21 O.S.) 1773, confirming the previous treaty of 1767 (see Bernstorff, J. H. E.). This was followed by the treaty of alliance between Denmark and Russia of the 12th of August 1773, which was partly a mutually defensive league, and partly an engagement between the two states to upset the new constitution recently established in Sweden by Gustavus III., when the right moment for doing so should arrive. For this misconceived and immoral alliance, which bound Denmark to the wheels of the Russian empress's chariot and sought to interfere in the internal affairs of a neighbouring state, Bernstorff was scarcely responsible, for the preliminaries had been definitely settled in his uncle's time and he merely concluded them, and he did not desire that the Russian treaty should ever be regarded as part of the Swedish policy as the correct one for Denmark, especially with a monarch like Gustavus III. on the Swedish throne. It is also pretty certain that the anti-Swedish alliance was Russia's price for compounding the Gottorp difficulty.

Starting from the hypothesis that Sweden was "Denmark-Norway's most active and irreconcilable enemy," Bernstorff logically included France, the secular ally of Sweden, among the hostile powers with whom an alliance was to be avoided, and drew near to Great Britain as the natural foe of France, especially during the American War of Independence, and this too despite the irritation occasioned in Denmark-Norway by Great Britain's masterful interpretation of the expression "contraband." Bernstorff's sympathy with England grew stronger still when in 1779 Spain joined her enemies; and he was much inclined, the same winter, to join a triple alliance between Great Britain, Russia and Denmark-Norway, proposed by England for the purpose of compelling the Bourbon powers to accept reasonable terms of peace. But he was overruled by the crown prince Frederick, who thought such a policy too hazardous, when Russia declined to have anything to do with it. Instead of this the Russian chancellor Nikita Panin proposed an armed league to embrace all the neutral powers, for the purpose of protecting neutral shipping in time of war. This league was very similar to one proposed by Bernstorff himself in September 1778 for enforcing the principle "a free ship makes the cargo free;" but as now presented by Russia, he rightly regarded it as directed exclusively against England. He acceded to it indeed (9th of July 1782) because he could not help doing so; but he had every reason to dislike it, for when news came of England, on the 4th of July, from his uncle, came to an understanding with that act of war and the expression "contraband of war." This independence caused great wrath at St Petersburgh, where Bernstorff was accused of disloyalty, and ultimately sacrificed to the resentment of the Russian government (13th of November 1780), the more readily as he already disagreed on many important points of domestic administration with the prime minister Høegh Guldberg.

He retired to his Mecklenburg estates, but on the fall of Guldberg four years later, was recalled to office (April 1784). The ensuing thirteen years were perhaps the best days of the old Danish absolutism. The government, under the direction of such enlightened ministers as Bernstorff, Reinhold and others, held the mean between Struensee's extravagant cosmopolitanism and Guldberg's stiff conservatism. In such noble projects of reform as the emancipation of the serfs (see Reventlow) Bernstorff took a leading part, and so closely did he associate himself with everything Danish, so popular did he become in the Danish capital, that a Swedish diplomatist expressed the opinion that henceforth Bernstorff could not be removed without danger. Liberal-minded as he was, he held that "the will of the nation should be a law to the king," and boldly upheld the freedom of the press as a beginning of liberty.

Meanwhile foreign complications were again endangering the position of Denmark-Norway. As Bernstorff had predicted, Panin's neutrality project had resulted in a breach between Great Britain and Russia. Then came Gustavus III.'s sudden war with Russia in 1788. Bernstorff was bound by treaty to assist Russia in such a contingency, but he took care that the assistance so rendered should be as trifling as possible, to avoid offending Great Britain and Prussia. Still more menacing became the political situation on the outbreak of the French Revolution. Ill-disposed as Bernstorff was towards the Jacobins, he now condemned on principle every interference in the domestic affairs of France, and he was persuaded that Denmark's safest policy was to keep clear of every anti-French coalition. From this unassailable standpoint he never swerved, despite the promises and even the menaces both of the eastern and the western powers. He was rewarded with complete success and the respect of all the diplomatists in Europe. His neutrality treaty with Sweden (17th of March 1794), for protecting their merchants by combined squadrons, was also extremely beneficial to the Scandinavian powers, both commercially and politicially. By the lesson of Poland, he had, in fact, long since abandoned his former policy of weakening Sweden. Bernstorff's great facilities appeared, indeed, to mature and increase with age, and his death, on the 21st of June 1797, was regarded in Denmark as a national calamity.

Count Bernstorff was twice married, his wives being the two sisters of the writers Counts Christian and Friedrich Leopold zu Stolberg. He left seven sons and three daughters. Of his sons the best known is Christian Günther, count von Bernstorff. Another, Count Joachim, was attached to his brother's fortunes so long as he remained in the Danish service, was associated with him in representing Denmark at the congress of Vienna, and in 1815 was appointed ambassador at that court.

Høegh-Guldberg (Copenhagen, 1899); and Bernstorffske og Danmark (Copenhagen, 1903). (R. B.)

BERNSTORFF, CHRISTIAN GÜNThER, COUNT VON (1759–1833), Danish and Prussian statesman and diplomatist, son of Count Andreas Peter von Bernstorff, was born at Copenhagen on the 3rd of April 1769. Educated for the diplomatic service under his father's direction, he began his career in 1787, as attaché to the representative of Denmark at the opening of the Swedish diet. In 1789 he went as secretary of legation to Berlin.
where his maternal uncle, Count Leopold Friedrich zu Stolberg, was Danish ambassador. His uncle's influence, as well as his own social qualities, obtained him rapid promotion; he was soon chargé d'affaires, and in 1797 minister plenipotentiary. In 1794 he exchanged this post for the important of one of ambassador at Stockholm, where he remained until May 1797, when he was summoned to Copenhagen to act as substitute for his father during his illness. On the death of the latter (21st June), he succeeded him as secretary of state for foreign affairs and privy councillor. In 1800 he became head of the ministry. He remained responsible for the foreign policy of Denmark until May 1810, a fateful period which saw the battle of Copenhagen (2nd of April 1801), the bombardment of Copenhagen and capture of the Danish fleet in 1807. After his retirement he remained without office until his appointment in 1811 as Danish ambassador at Vienna. He remained here, in spite of the fact that for a while Denmark was nominally at war with Austria, until, in January 1814, on the accession of Denmark to the coalition against Napoleon, he publicly resumed his functions as ambassador. He accompanied the emperor Francis to Paris, and was present at the signature of the first peace of Paris. With his brother Joachim, he represented Denmark at the congress of Vienna and, as a member for the commission for the regulation of the affairs of Germany, was responsible for some of that confusion of Danish and German interests which was to bear bitter fruit later in the Schleswig-Holstein question (q.v.). He again accompanied the allied sovereigns to Paris in 1815, returning to Copenhagen the same year. In 1817 he was appointed Danish ambassador at Berlin, his brother Joachim going at the same time to Vienna. In the following year Prince Hardenberg made him the formal proposition that he should transfer his services to Prussia, which, with the consent of his sovereign, he did.

It was, therefore, as a Prussian diplomat that Bernstorff attended the congress of Aix-la-Chapelle (October 1818), at the close of which he returned to Berlin as minister of state and head of the department for foreign affairs. Bernstorff's management of Prussian policy during the many years that he remained in office has been variously judged. He was by training and temperament opposed to the Revolution, and he was initiated into his new duties as a Prussian minister by the reactionary Ancillon. He is accused of having subordinated the particular interests of Prussia to the European policy of Metternich and the Holy Alliance. Whether any other policy would in the long run have served Prussia better is a matter for speculation. It is true that Bernstorff supported the Carlsbad decrees, and the Ancillon system, which was the law of the land at that time, of remaining in the good graces of Metternich at the congresses of Laibach, Troppau and Verona. On the other hand, he took a considerable share in laying the foundations of the customs union (Zollverein), which was destined to be the foundation of the Prussian hegemony in Germany. In his support of Russia's action against Turkey in 1828 also he showed that he was no blind follower of Metternich's views.

In the crisis of 1830 his moderation in face of the warlike clamour of the military party at Berlin did much to prevent the troubles in Belgium and Poland from ending in a universal European conflagration.

From 1824 onward Bernstorff had been a constant sufferer from hereditary gout, intensified and complicated by the results of overwork. In the spring of 1832 the state of his health compelled him to resign the ministry of foreign affairs to Ancillon, who had already acted as his deputy for a year. He died on the 18th of March 1835.

BERNSTORFF, JOHANN HARTWIG ERNST, Count von (1712-1773), Danish statesman, who came of a very ancient Mecklenburg family, was the son of Joachim Engelke, Freiherr von Bernstorff, chamberlain to the elector of Hanover, and was born on the 13th of May 1712. His maternal grandfather, Andreas Gottlieb Bernstorff (1695-1766), had been one of the ablest ministers of George L., and under his guidance Johann was very carefully educated, acquiring amongst other things that intimate knowledge of the leading European languages, especially French, which ever afterwards distinguished him. He came into the Danish service by his relations, the brothers Plessen, who were ministers of state under Christian VI. In 1732 he was sent on a diplomatic mission to the court of Dresden; and from 1738 he represented Holstein at the diet of Regensburg, from 1744 to 1750 he represented Denmark at Paris, whence he returned in 1754 to Denmark as minister of foreign affairs. Supported by the powerful favourite A. G. Moltke, and highly respected by Frederick V., he occupied for twenty-one years the highest position in the government, and in the council of state his opinion was decisive. But his chief concern was with foreign affairs. Ever since the conclusion of the Great Northern War, Danish statesmen had been occupied in harvesting its fruits, namely, the Gottorp portions of Schleswig definitely annexed to Denmark in 1721 by the treaty of Nystad, and endeavouring to bring about a definitive general understanding with the house of Gottorp as to their remaining possessions in Holstein. With the head of the Swedish branch of the Gottorps, the crown prince Adolphus Frederick, things had been arranged by the exchange of 1750; but an attempt to make a similar arrangement with the chief of the elder Gottorp line, the cesarevitch Peter Fedorovich, had failed. In intimate connexion with the Gottorp affair stood the question of the political equilibrium of the north. Ever since Russia had become the dominant Baltic power, as well as the state to which the Gottorps looked primarily for help, the necessity for a better understanding between the two Scandinavian kingdoms had clearly been recognized by the best statesmen of both, especially in Denmark from Christian VI's time; but unfortunately this sound and sensible policy was seriously impeded by the survival of the old national hatred on both sides of the Sound, still further complicated by Gottorp's hatred of Denmark. Moreover, it was a diplomatic axiom in Denmark, founded on experience, that an absolute monarchy in Sweden was incomparably more dangerous to her neighbour than a limited monarchy, and after the collapse of Swedish absolutism with Charles XII., the upholding of the comparatively feeble, and ultimately anarchical, parliamentary government of Sweden became a question of principle with Danish statesmen throughout the 18th century. A friendly alliance with a relatively weak Sweden was the cardinal point of Bernstorff's policy. But his plans were traversed again and again by unforeseen complications, the failure of the most promising presumptions, the perpetual shifting of apparently stable alliances; and again and again he had to modify his means to attain his ends. Amidst all these perplexities Bernstorff approved himself a considerably statesman. It seemed almost as if his wits were sharpened into a keener edge by his very difficulties; but since he condemned on principle every war which was not strictly defensive, and it had fallen to his lot to guide a comparatively small power, he always preferred the way of negotiation, even sometimes where the diplomatic tangle would perhaps best have been severed boldly by the sword. The first difficult problem he had to face was the Seven Years' War. He was determined to preserve the neutrality of Denmark at any cost, and this he succeeded in doing, despite the existence of a subsidy-treaty with the king of Prussia, and the suspicions of England and Sweden. It was through his initiative, too, that the convention of Kloster-Severn was signed (10th of September 1757), and on the 4th of May 1758 he concluded a still more promising treaty with France, whereby, in consideration of Denmark's holding an army-corps of 24,000 men in Holstein till the end of the war, to secure Hamburg, Lübeck and the Gottorp part of Holstein from invasion, France, and ultimately Austria also, engaged to bring about an exchange between the king of Denmark and the cesarevitch, as regards Holstein. But the course of the war made this compact inoperative. Austria hastened to repudiate her guarantee to Denmark in order not to offend the new emperor of Russia, Peter III., and one of Peter's first acts on ascending the throne was to declare war against Denmark. The coolness
BEROSSUS—BERRY, DUKE OF

and firmness of Bernstorff saved the situation. He protested that the king of Denmark was bound to defeat Schleswig "sizable as it was wounded in Denmark and a drop of blood in the veins of the Danish people." He rejected the insulting ultimatum of the Russian emperor. He placed the best French general of the day at the head of the well-equipped Danish army. But just as the Russian and Danish armies had come within striking distance, the tidings reached Copenhagen that Peter III. had been overthrown by his consort. Bernstorff was one of the first to recognize the impotence of the French monarchy after the Seven Years' War, and in 1763 he considered it expedient to exchange the French for the Russian alliance, which was cemented by the treaty of the 28th of April (March 11) 1769. This compact engaged Denmark to join with Russia in upholding the existing Swedish constitution, in return for which Catherine II. undertook to adjust the Gottorp difficulty by the cession of the Gottorp portion of Holstein in exchange for the counties of Oldenburg and Delmenhorst. For his part in this treaty Bernstorff was created count. On the accession of Christian VII., in 1766, Bernstorff's position became very precarious, and he was exposed to all manner of attacks, being accused, without a shadow of truth, of exploiting Denmark, and of unduly promoting foreigners. It is remarkable, however, that through Bernstorff's virtuous twenty years he never learnt Danish. His last political achievement was to draw still closer to Russia by the treaty of the 13th of December 1769, the most important paragraph of which stipulated that any change in the Swedish constitution should be regarded by Denmark and Russia as a casus belli against Sweden, and that in the event of such a war Denmark should retain all the territory conquered from Sweden. This treaty proved to be a great mistake on Denmark's part, but circumstances seemed at the time to warrant it. Nine months later, on the 13th of September 1770, Bernstorff was dismissed as the result of Struensee's intrigues, and, rejecting the brilliant offers of Catherine II. if he would enter the Russian service, retired to his German estates, where he died on the 18th of February 1772. Bernstorff was not only one of the ablest but one of the noblest and most conscientious statesmen of his day. The motto he chose on receiving the order of the Danebog was "Integra et rectum custodiem me," and throughout a long life he was never false to it.

BEROSSUS, a priest of Bel at Babylon, who translated into Greek the standard Babylonian work on astrology and astronomy, and compiled (in three books) the history of his country from native documents. He published in Greek in the reign of Antiochus II. (250 B.C.). His works have perished, but extracts from the history have been preserved by Josephus and Eusebius, the latter of whom probably derived them not directly from Berosus, but through the medium of Alexander Polyhistor and Apollodorus. The extracts containing the Babylonian cosmology, the list of the antediluvian kings of Babylonia, and the Chaldaean story of the Deluge, have been shown by the decipherment of the cuneiform texts to have faithfully reproduced the native legends; we may, therefore, conclude that the rest of the History was equally trustworthy. On the other hand, a list of post-diluvian dynasties, which is quoted by Eusebius and Georgius Syncellus as having been given by Berosus, cannot, in its present form, be reconciled with the monumental facts, though a substratum of historical truth is discoverable in it. As it stands, it is as follows:

1. 86 Chaldaean kings 34,080 or 33,091 years
2. Median ... 274
3. 11 other kings ... no number...
4. 49 Chaldaean ... 458
5. 9 Arabian ... 245
6. 6 Assyrian ... 729

After these, according to Eusebius, came the reign of Pal. By means of an ingenious chronological combination, the several items of which, however, are very questionable, J. A. Brandis assigned 258 years to the 3rd dynasty; other summations have been proposed with equally little assurance of certainty. Eusebius can be trusted, the 6th dynasty ended in 729 B.C., the year in which Pulp or Tiglath-pileser III. was crowned king of Babylon. But all attempts to harmonize the scheme of dynasties thus ascribed to Berosus with the list given us in the so-called dynastic Tablets discovered by Dr Pinches have been failures. The numbers, whether of kings or of years, cannot have been handed down to us correctly by the Greek writers. All that seems certain is that Berosus arranged his history so that it should fill the astronomical period of 36,000 years, beginning with the first man and ending with the conquest of Babylon by Alexander the Great.

BERRY, CHARLES ALBERT (1852-1899), English non-conformist divine, was born on the 14th of December 1852 at Bradshawgate, Leigh, Lancashire. At the age of seventeen he entered Airedale College, Bradford, to train for the Congregational ministry, and in 1875 became pastor of St George's Road Congregational church, Bolton. He became widely known as a man of administrative ability, a vigorous platform speaker and eloquent preacher. In July 1882 he undertook the pastorate of the church at Queen Street, Wolverhampton, with the supervision of nine dependent churches in the neighbourhood. Here again he exercised a wide influence, due in part to his evangelical conviction, eloquence, broad views and powers of organization, but also to the magnetic force of his personality. In 1887 he went to America in fulfilment of a promise to Henry Ward Beecher of Brooklyn, and received an unanimous invitation to succeed Beecher in what was then the best-known pulpit in the United States. Berry, however, felt that his work lay in England and declined the invitation. In 1892 he took part in a conference at Grindelwald on the question of Christian Union, and subsequently, with Hugh Price Hughes and Alexander Mackenfall of Bowdon, conducted a campaign throughout England, introducing the ideas and principles of Free Church federation. He was the first president of the Free Church congress. He played an effective part in expressing the popular desire for peace between England and America in reply to President Cleveland's message on the Venezuelan boundary dispute, and was invited to Washington to preach in connexion with the endeavour to establish an international church tribunal. In January 1899 he elected chairman of the Congregational Union of England and Wales. In 1898 his health began to fail, and he died suddenly on the 31st of January 1899. His published works consist chiefly of addresses, and two volumes of sermons, Vision and Duty, and Miscellaneous Goodness.

BERRY, CHARLES FERDINAND, DUKE OF (1778-1830), younger son of Charles X. of France, was born at Versailles. At the Revolution he left France with his father, then comte d'Artois, and served in the army of Condé from 1792 to 1797. He afterwards joined the Russian army, and in 1801 took up his residence in England, where he remained for thirteen years. During that time he married an Englishwoman, Anna Brown, by whom he had two daughters, afterwards the baronne de Charette and the comtesse de Lucinge-Faucigny. The marriage was cancelled for political reasons in 1814, when the duke set out for France. His frank, open manners gained him some favour with his countrymen, and Louis XVIII. named him commander-in-chief of the army at Paris on the return of Napoleon from Elba. He was, however, unable to retain the loyalty of his troops, and retired to Ghent during the Hundred Days. In 1816 he married the princess Caroline (1798-1870), eldest daughter of King Francis I. of Naples. On the 13th of February 1820 he was mortally wounded, when leaving the opera-house at Paris with his wife, by a saddler named Louis Pierre Louvel. Seven months after his death she gave birth to a son, who received the title of duke of Bordeaux.

(D. M.X.)
but who is known in history as the comte de Chambord. A daughter, afterwards duchess of Parma, was born 1819.

The duchess of Berry was compelled to follow Charles X. to Holyrood after July 1830, but it was with the resolution of returning speedily and making an attempt to secure the throne for her son. From England she went to Italy, and in April 1832 she landed near Marseilles, but, receiving no support, was compelled to make her way towards the loyal districts of Vendée and Brittany. Her followers, however, were defeated, and, after remaining concealed for five months in a house in Nantes, she was betrayed to the government and imprisoned in the castle of Blaye. Here she gave birth to a daughter, the fruit of a secret marriage contracted with an Italian nobleman, Count Ettore Lucchesi-Palli (1805-1864). The announcement of this marriage at once deprived the duchess of the sympathies of her supporters. She was no longer an object of fear to the French government, who released her in June 1833. She set sail for Sicily, and, joining her husband, lived in retirement from that time till her death, at Brunensee in Switzerland, in April 1870.

BERRY, JOHN, DUKE OF (1340-1416), third son of John II, king of France and Bonne of Luxemburg, was born on the 30th of May 1340. His father, who was duke of Berry from 1336, was made king's lieutenant in southern France, though the real power rested chiefly with John of Armagnac, whose daughter Jeanne he married in 1360. The loss of his southern possessions by the treaty of Bretigny was compensated by the fiefs of Auvergne and Berry, with the rank of peer of France. The duke went to England in 1360 as a hostage for the fulfilment of the treaty of Bretigny, returning to France in 1367 on the pretext of collecting his ransom. He took no leading part in the war against the English, his energies being largely occupied with the satisfaction of his artistic and luxurious tastes. For this reason perhaps his brother Charles V. assigned him no share in the government during the minority of Charles VI. He received, however, the province of Languedoc.

The peasant revolt of the Fuchius and Coquins, as the insurgents were called, was suppressed with great harshness, and the duke exacted from the states of Languedoc assembled at Lyons a fine of £15,000. He fought at Rosebeke in 1382 against the Flemings and helped to suppress the Parisian revolts. A series of defeats caused the failure of the naval expedition prepared at Shy against England in 1386, and a second accusation of military negligence led to disgrace of the royal princes and the temporary triumph of the marmousets, as the advisers of the late king were nicknamed. Charles VI. visited Languedoc in 1389-1390, and enquired into his uncle's government. The duke was deprived of the government of Languedoc, and his agent, Béziauc, was burnt. When in 1401 he was restored, he delegated his authority in the province, where he was still hated, to Bérard d'Armagnac. In 1366 he negotiated a truce with Richard II. of England, and his marriage with the princess Isabella of France. He tried to mediate between his brother Philip the Bold of Burgundy and his nephew Louis, duke of Orleans, and later between John "sans Peur" of Burgundy and Orleans. He broke with John after the murder of Orleans, though he tried to prevent civil war, and only finally joined the Armagnac party in 1410. In 1413 he resumed his role of mediator, and was for a short time tutoy to the dauphin. In 1416 the Peace of the Treaty of Noyon, leaving vast treasures of jewelry, objects of art, and especially of illuminated MSS., many of which have been preserved. He decorated the Sainte Chapelle at Bourges; he built the Hôtel de Nesle in Paris, and palaces at Poitiers, Bourges, Muhon-sur-Varède and elsewhere.

See also L. Raynal, Histoire du Berry (Bourges, 1848); "Jean, duc de Berry," in S. Luce, La France pendant la guerre de Cent Ans (1890), vol. i.; Toulgoet-Trénard, in Memoire de la Soc. des antiquaires du centre (1849). For illustrative plates of Berry see also the beautiful illustrated Livre d'heures reproduced (Paris, fol. 1904) by P. Durrieu.

BERRY, or BERRY, a former province of France, absorbed in 1790 in the departments of Cher, corresponding roughly with Haut-Berry, and Indre, representing Bas-Berry. George Sand, the most famous of "berrichon" writers, has described the quiet scenery and rural life of the province in the rustic novels of her later life. Berry is the civitas or pagus Bituricensis of Gregory of Tours. The Bituriges were said by Livy (v. 34) to have been the dominating tribe in Gaul in the 7th century, one of their kings, Ambigat, having ruled over all Gaul. In Caesar's time they were dependent on the Aedui. The tribes inhabiting the districts of Berry and Bourbonnais were distinguished as Bituriges Cubi. The numerous menhirs and dolmens to be found in the district, to which local superstitions still cling, are probably monuments of still earlier inhabitants. In 52 B.C. the Bituriges, at the order of Vercingetorix, set fire to their towns, but spared Bourges (Avaricum) their capital, which was taken and sacked by the Romans. The province was amalgamated under Augustus with Aquitaine, and Bourges became the capital of Aquitania Prima. In 475 Berry came into the possession of the west Goths, from whom it was taken (c. 507) by Clovis. The first count of Berry, Chumbert (d. 763), was created by Waifer, duke of Aquitaine, from whom the county was wrested by Pippin the Short, who made it his residence and left it to his son Carloman, on whose death it fell to his brother Charlemagne. The countship of Berry was suppressed (926) by Rudolph, king of the Franks (fl. 923-936). Berry was for some time a fief of the county of Artois. In 1360 Charles V., the chief authority eventually passed to the viscounts of Bourges, who, while owning the royal suzerainty, preserved a certain independence until 1101, when the viscount Odo Arpin de Dun sold his fief to the crown. Berry was part of the dowry of Eleanor, wife of Louis VII., and on her divorce and remarriage with Henry II. of England it passed to the English king. Its possession remained, however, a matter of dispute until 1200, when Berry reverted by treaty with John of England to Philip Augustus, and the various fiefs of Berry were given as a dowry to John's niece, Blanche of Castile, on her marriage with Philip's son Louis (afterwards Louis VIII.). Philip Augustus established an effective control over the administration of the province by the appointment of a royal baili. Berry suffered during the Hundred Years' War, and more severely during the wars of religion in the 16th century. It had been made a duchy in 1366, and its first duke, John [Jean] (1340-1416), son of the French king John II., encouraged the arts and beautified the province with money wrung from his government of Languedoc. Thenceforward it was held as an aparnage of the French crown, usually by a member of the royal family closely related to the king. Charles of France (1447-1472), brother of Louis XI., was Duke of Berry, but was deprived of this province, as subsequently the duchies of Normandy and Guienne, for intrigues against his brother. The duky was also governed by Jeanne de Valois (d. 1505), the repudiated wife of Louis XII.; by Marguerite d'Angoulême, afterwards queen of Navarre; by Marguerite de Valois, afterwards duchess of Savoy; and by Louise of Lorraine, widow of Henry III., after whose death (1601) the province was finally reabsorbed in the royal domain. The title of duke of Berry, bestowed of territorial significance, was held by princes of the royal house. Charles (1666-1714), Duke of Berry, grandson of Louis XIV., and third son of the dauphin Louis (d. 1711), married Marie Louise Elisabeth (1686-1714), eldest daughter of the duke of Orleans, whose intrigues made her notorious. The last to bear the title of duke of Berry was the ill-fated Charles X. (d. 1824), grandson and heir of Charles X.

BERRYER, ANTOINE PIERRE (1790-1868), French advocate and parliamentary orator, was the son of an eminent advocate and counsellor to the parlement. He was educated at the Collège de Juilly, on leaving which he adopted the profession of the law; he was admitted advocate in 1811, and in the same year he married. In the great conflict of the period between Napoleon I. and the Bourbons, Berryer, like his father, was an ardent Legitimist; and in the spring of 1815, at the opening of the campaign of the Hundred Days, he followed Louis XVIII. to Ghent as a volunteer. After the second restoration he distinguished himself as a courageous advocate of moderation in the treatment of the military adherents of the emperor.

1 See R. le Maudre, Jeanne de France, duchesse d'Orléans et de Berry (Paris, 1883).
assisted his father and Dupin in the unsuccessful defence of Marshal Ney before the chamber of peers; and he undertook alone the defence of General Cambronne and General Debelle, procuring the acquittal of the former and the pardon of the latter. By this time he had a very large business as advocate, and was engaged on behalf of journalists in many press prosecutions. He stood forward with a noble resolution to maintain the freedom of the press, and severely censured the rigorous measures of the police department. In 1830, not long before the fall of Charles X., Berryer was elected a member of the chamber of deputies. He appeared there as the champion of the king and encouraged him in his reactionary policy. After the revolution of July, when the Legitimists withdrew in a body, Berryer alone remained his seat as deputy. He resisted, but unsuccessfully, the abolition of the hereditary peerage. He advocated trial by jury in press prosecutions, the extension of municipal franchises and other liberal measures. In May 1832 he hastened from Paris to see the duchess of Berry on her landing in the south of France for the purpose of organizing an insurrection in favour of her son, the duke of Bordeaux, since known as the Comte de Chambord. Berryer attempted to turn her from her purpose; and failing in this he set out for Switzerland. He was, however, arrested, imprisoned, and placed in the Bastille the very same day that Berryer had immediately acquired. In the following year he pleaded for the liberation of the duchess, made a memorable speech in defence of Chateaubriand, who was prosecuted for his violent attacks on the government of Louis Philippe, and undertook the defence of several Legitimist journalists. Among the more noteworthy events of his subsequent career were his defence of Louis Napoleon after the ridiculous affair of Boulogne, in 1840, and a visit to England in December 1843, for the purpose of formally acknowledging the pretender, the duke of Bordeaux, then living in London, as Henry V. and lawful king of France. Berryer was an active member of the National Assembly convoked after the revolution of February 1848, again visited the pretender, then at Wiesbaden, and still fought in the old cause. This long parliamentary career was closed by a courageous protest against the coup d'état of December 2, 1851. After a lapse of twelve years, however, he appeared once more in his forsworn field as a deputy to the Corps Législatif. Berryer was elected member of the French Academy in 1854. A visit paid by this famous orator to Lord Brougham in 1865 was marked by an outburst of enthusiasm given in his honour by the members of the Temples, the hands of King Louis's King. In November 1868 he was removed by his own desire from Paris to his country seat at Augerville, and there he died on the 29th of the same month.

BERSERKER—BERTAT

BERTAT (1832-1880), Italian revolutionist, was born at Milan on the 10th of October 1812. He took part in the insurrection of 1848, though opposed to the fusion of Lombardy with Piedmont. During the Roman republic of 1849, he, as medical officer, organized the ambulance service and, after the fall of Rome, withdrew to Genoa, where he worked with Sir James Hudson for the liberation of the political prisoners of Naples, but held aloof from the Mazzinian conspiracies. In 1859 he founded a revolutionary journal at Genoa, but, shortly afterwards, joined as surgeon the Garibaldian corps in the war of 1859. After Villafranca he became the organizer-in-chief of the expeditions to Sicily, remaining at Genoa after Garibaldi's departure for Marsala, and organizing four separate volunteer corps, two of which were intended for Sicily and two for the papal states. Cavour, however, obliged all to sail for Sicily. Upon the arrival of Garibaldi at Naples, Bertani was appointed secretary-general of the dictator, in which capacity he abolished the secret service fund, founded twelve infant asylums, suppressed the duties upon Sicilian products, prepared for the suppression of the religious orders, and planned the sanitary reconstruction of the city. Entering parliament in 1861, he opposed the Garibaldian expedition, which ended at Appromonte, but nevertheless tended Garibaldi's wound with affectionate devotion. In 1866 he organized the medical service for the 40,000 Garibaldians, and in 1867 fought at Mentana. His parliamentary career, though marked by zeal, was less brilliant than his revolutionary activity. Up to 1870 he remained an agitator, but, after the liberation of Rome, seceded from the historic left, and became leader of the extreme left, a position held until his death on the 29th of April 1886. His chief work as deputy was an inquiry into the sanitary conditions of the peasantry, and the preparation of the sanitary code adopted by the Crispi administration. (H. W. S.)

BERTAT (Arab. Jebalān), negroes of the Shangalla group of Sudanese, were agriculturists. They occupy the fertile valleys of the Yaboe and Tumat, tributaries of the Blue Nile. They are shortish and very black, with projecting jaws, broad noses and thick lips. By both sexes the hair is worn short or the head shaved; on cheeks and temple are tribal marks in the form of scars. The huts of the Bertat are circular, the floor raised on short poles. Their weapons are the spear, throwing-cup, sword and dagger, and also the kulbedo orthrowing-knife. Blocks of salt are the favourite form of currency. Gold washing is practised. Nature worship still struggles against the spread of Mahomedanism. The Bertat, estimated to number some 80,000, c. 1880, were
BERTH., originally a nautical term, probably connected with the verb "to bear," first found in literature at the end of the 16th century, with the alternative spelling "birth." Its primary meaning is "sea-room," whether on the high seas or at anchor. Hence the phrase "to give a wide berth to," meaning "to keep at a safe distance from," both in its literal and its metaphorical use. From meaning sea-room for a ship at anchor, "berth" comes to mean also the position of a ship at moorings ("to berth a ship"). The word further means any place on a ship allotted for a special purpose, where the men mess or sleep, or an office or appointment on board, whence the word has passed into colloquial use with the meaning of a situation or employment. From the Icelandic byrdi, a board, is also derived the ship-building term "berth," meaning to board, put up bulk-heads, etc.

BOILEAU DECELIN PIERRE EUGÈNE (1827–1907), French chemist and politician, was born at Paris on the 29th of October 1832, being the son of a doctor. After distinguishing himself at school in history and philosophy, he turned to the study of science. In 1851 he became a member of the staff of the Collège de France as assistant to A. J. Balard, his former master, and about the same time he began his life-long friendship with Ernest Renan. In 1854 he made his reputation by his doctoral thesis, Sur les combinaisons de la glycérine avec les acides, which described a series of beautiful researches in combination and amplification of M. E. Chevreul's classical work. In 1859 he was appointed professor of organic chemistry at the École Supérieure de Pharmacie, and in 1865 he accepted the new chair of organic chemistry, which was specially created for his benefit at the Collège de France. He became a member of the Faculty of Medicine in 1865, and ten years afterwards entered the Academy of Sciences, of which he became perpetual secretary in 1889 in succession to Louis Pasteur. He was appointed inspector general of higher education in 1876, and after his election as life senator in 1881 he continued to take an active interest in education. He was a member of the Joffre and the Bourgeois cabinet of 1893. He was a member of the cabinet of 1895. He died suddenly, immediately after the death of his wife, on the 18th of March 1907, at Paris, and with her he was buried in the Panthéon.

The fundamental conception that underlay all Berthelot's chemical work was that all chemical phenomena depend on the action of physical forces which can be measured. When he began his active career it was generally believed that, although some instances of the synthetic production of organic substances had been observed, on the whole organic chemistry must remain an analytical science and could not become a constructive one, because the formation of the substances with which it deals required the intervention of vital activity in some shape. To this attitude he offered uncompromising opposition, and by the synthetic production of numerous hydrocarbons, natural fats, sugars and other bodies he proved that organic compounds can be formed by ordinary methods of chemical manipulation and obey the same laws as inorganic substances, thus exhibiting the "creative character in virtue of which chemistry actually realizes the abstract conceptions of its theories and classifications—a prerogative so far possessed neither by the natural nor by the historical sciences." His investigations on the synthesis of organic compounds were published in numerous papers and books, including Chimie organique fondée sur la synthèse (1860) and Les Carbures d'hydrogène (1901). Again he held that chemical phenomena are not governed by any peculiar laws special to themselves, but are explicable in terms of the general laws of mechanics that are in operation throughout the universe; and this view he developed, with the aid of thousands of experiments, in his Mécanique chimique (1883) and in his Théorème chimique (1897). This branch of study naturally conduits him to extending the synthetics, and on the theoretical side led to the results published in his work Sur la force de la poudre et des matières explosives (1872), while on the practical side it enabled him to render important services to his country as president of the scientific defense committee during the siege of Paris in 1870-71 and subsequently as chief of the French explosives committee. In the later years of his life he turned to the study of the earlier phases of the science which he did so much to advance, and students of chemical history are greatly indebted to him for his book on Les Origines de l'alchimie (1885) and his Introduction à l'étude de la chimie des anciens et du moyen âge (1886), as well as for publishing translations of various old Greek, Syriac and Arabic treatises on alchemy and chemistry (Collection des anciens alchimistes grecs, 1887-1888, and La Chimie au moyen âge, 1893). He was also the author of Science et philosophie (1886), which contains a well-known letter to Renan on "La Science idéale et la science positive," of La Révolution chimique, Lavosser (1893), of Science et malheur (1897), and of numerous articles in La Grande Encyclopédie, which he helped to establish.

BÉRÉNICE LOUIS ALEXANDRE (1753–1819), marshal of France and chief of the staff under Napoleon I, was born at Versailles on the 29th of February 1753. As a boy he was instructed in the military art by his father, an officer of the Corps de Génie, and at the age of seventeen he entered the army, serving successively in the staff, the engineers and the prince de Lambesc's dragoons. In 1780 he went to North America with Rochambeau, and on his return, having attained the rank of colonel, he was employed in various staff posts and in a military mission to Prussia. During the Revolution, as chief of staff of the Versailles national guard, he protected the aunts of Louis XVI. From popular violence, and aided their escape (1791). In the war of 1792 he was at once made chief of staff to Marshal Lückner, and he bore a distinguished part in the Argonne campaign of Dumasriéz and Kellermann. He served with great credit in the Vendéan War of 1793-95, and was in the next year made a general of division and chief of staff (Major-Général) to the army of Italy, which, although short of staff officers, had the reputation of being a hard one. His power of work, accuracy and quick comprehension, combined with his long and varied experience and his complete mastery of detail, made him the ideal chief of staff to a great soldier; and in this capacity he was Napoleon's most valued assistant for the rest of his career. He accompanied Napoleon throughout the brilliant campaign of 1796, and was left in charge of the army after the peace of Campo Formio. In this post he organized the Roman republic (1798), after which he joined his chief in Egypt, serving there until Napoleon's return. He assisted in the coup d'état of 18th Brumaire, afterwards becoming minister of war for
a time. In the campaign of Marengo he was the nominal head of the Army of Reserve, but the first consul accompanied the army and Berthier acted in reality, as always, as chief of staff to Napoleon. At the close of the campaign he was employed in civil and diplomatic business. When Napoleon became emperor, Berthier was at once made a marshal of the empire. He took part in the campaigns of Auerstedt, Jena and Friedland, and was created duke of Valengin in 1806, sovereign prince of Neuchâtel in the same year and vice-consable of the empire in 1807. In 1808 he served in the Peninsula, and in 1809 in the Austrian War, after which he was given the title of prince of Wagram. Berthier married a niece of the king of Bavaria. He was with Napoleon in Russia in 1812, Germany in 1813, and France in 1814, fulfilling, till the fall of the empire, the functions of "major-general" of the Grande Armée. He abandoned Napoleon to make his peace with Louis XVIII. in 1814, and accompanied the king in his solemn entry into Paris. During Napoleon's captivity in Elba, Berthier, whom he informed of his projects, was much perplexed as to his future course, and, being unwilling to commit himself, fell under the suspicion both of his old leader and of Louis XVIII.

On Napoleon's return he withdrew to Bamberg, where he died on the 1st of June 1815. The manner of his death is given variously by members of a secret society, others say that, maddened by the sight of Russian troops marching to invade France, he threw himself from his window and was killed. Berthier was not a great commander. When he was in temporary command in 1800 the French army in Bavaria underwent a series of reverses. Whatever merit as a general he may have possessed was completely overshadowed by the genius of his master. But his title to fame is that he understood and carried out that master's directions to the minutest detail.

**BERTHOLLET, CLAUDE LOUIS** (1748-1822), French chemist, was born at Talloire, near Annecy in Savoy, on the 9th of December 1748. He studied first at Chambery and afterwards at Turin, where he graduated in medicine. Settling in Paris in 1772, he became the private physician of Philip, duke of Orleans, and by his chemical work soon gained so high a reputation that in 1780 he was admitted into the Academy of Sciences. In 1785 he declared himself an adherent of the Lavoisian school, though he did not accept Lavoisier's view of oxygen as the only and essential acidifying principle, and he took part in the reform in chemical nomenclature carried out by Lavoisier and his associates in 1787. Among the substances of which he investigated the composition were ammonia, sulphuretted hydrogen and prussic acid, and his experiments on chlorine, which he regarded, not as an element, but as oxygenated mercuric (oxymercuric) acid, led him to propose it as a bleaching agent in 1785. He also prepared potassium chloride and attempted to use it in the manufacture of gunpowder as a substitute for saltpetre. When, at the beginning of the French Revolution, the deficiency in the supply of saltpetre became a serious matter, he was placed at the head of the commission entrusted with the development of its production in French territory, and another commission on which he served had for its object the improvement of the methods of iron manufacture. He was also a member in 1794 of the committee on agriculture and the arts, and technical science was further induced to him for a systematic exposition of the principles of dyeing—"Règles de l'art de la teinture", 1795, of which he published a second edition in 1809, in association with his son, A. B. Berthollet (1783-1811). After 1794 he was teacher of chemistry in the polytechnic and normal schools of Paris, and in 1795 he took an active part in remodelling the Academy as the Institut National. In the following year he and Gaspard Monge were chosen chiefs of a commission charged with the task of selecting in Italy the choicest specimens of ancient and modern art for the national galleries of Paris; and in 1798 he was one of the band of scientific men who accompanied Napoleon to Egypt, there forming themselves into the Institute of Egypt on the plan of the Institut National. On the fall of the Directory he was made a senator and grand officer of the Legion of Honour; under the empire he became a count; and after the restoration of the Bourbons he took his seat as a peer. In the later years of his life he had at Arcueil, where he resided on the 6th of November 1822, a well-equipped laboratory, which became a centre frequented by some of the most distinguished scientific men of the time, their proceedings being published in three volumes, between 1807 and 1817, as the *Mémoires de la société d'Arcueil*. Berthollet's most remarkable contribution to chemistry was his *Essai de statique chimique* (1803), the first systematic attempt to grapple with the problems of chemical physics. His doctrines did not meet with general approval among his contemporaries, partly perhaps because he pushed them too far, as for instance in holding that two elements might combine in constantly varying proportions, a view which gave rise to a long dispute with L. J. Proust; but his speculations, in particular his insistence on the influence of the relative masses of the acting substances in chemical reactions, have exercised a dominating influence on the modern developments of the theory of chemical affinity, of which, far more than T. O. Bergman, whom he controverted, he must be regarded as the founder.

**BERTHON, EDWARD LYON** (1813-1899), English inventor, was born in London, on the 26th of February 1813, the son of an officer of the Bombay Engineers, and educated at King's College, London.

He studied for the medical profession in Liverpool and at Dublin, but after his marriage in 1834 he gave up his intention of becoming a doctor, and travelled for about six years on the continent. Keenly interested from boyhood in mechanical science, he made experiments in the application of the screw propeller for boats. But his model, with a two-bladed propeller, was only ridiculed when it was placed before the British admiralty. Berthon therefore did not complete the patent and the idea was left for Francis Smith to bring out more successfully in 1838. In 1841 he entered Magdalene College, Cambridge, in order to study for the Church. There he produced what is usually known as "Berthon's log," in which the suction produced by the water streaming past the end of a pipe projected below a ship is registered on a mercury column above. In 1845 he was ordained, and after holding a curacy at Lymington was given a living at Fareham. There he was able to carry on experiments with his log, which was tested on the Southampton to Jersey steamboats; but the British admiralty gave him no encouragement, and it remained uncompleted. He next designed some instruments to indicate the trim and rolling of boats at sea; but the idea for which he is chiefly remembered was that of the "Berthon Folding Boat" in 1849. This invention was again adversely reported on by the admiralty. Berthon resigned his living at Fareham, and subsequently accepted the living of Romsey. In 1873, encouraged by Samuel Plimsoll, he again applied himself to perfecting his collapsible boat. Success was at last achieved, and in less than a year he had received orders from the admiralty for boats to the amount of £15,000. Some were taken by Sir George Nares to the Arctic; others were sent to General Gordon at Khartum, and others again were taken to the Zambesi by F. C. Selous. Berthon died on the 27th of October 1890.

**BERTHOUD, FERDINAND** (1727-1807), Swiss chronometer-maker, was born at Plancemont, Neuchâtel, in 1727, and settling in Paris in 1745 gained a great reputation for the excellence and accuracy of his chronometers. He was a member of the Institute and a fellow of the Royal Society of London, and wrote a large Dissertation "Essai sur l'horlogerie" (1763). He died in 1807 at Montmorency, Seine et Oise. He was succeeded in business by his nephew, Louis Berthoud (1759-1813).

**BERTILLON, LOUIS ADOLPHE** (1821-1883), French statistician, was born in Paris on the 1st of April 1821. Entering the medical profession, he practised as a doctor for a number of years. After the revolution of 1870, he was appointed inspector-general of benevolent institutions. He was one of the founders of the school of anthropology of Paris, and was appointed a professor there in 1876. His *Démographie figurée de la France* (1874) is an able statistical study of the population of France. He died at Neully on the 28th of February 1883.

His son Alphonse Bertillon, the anthropometrist, was born in Paris in 1853. He published in 1883 a work *Ethnographie*.
moderne des races savages, but his chief claim to distinction lies in the system invented by him for the identification of criminals, which is described by him in his Photographie judiciaire, Paris, 1806 (see Astronomometry). He was officially appointed in 1804 to report on the handwriting of the borderers in the Dreyfus case, and was a witness for the prosecution before the cour de cassation on the 18th of January 1899.

BERTIN, a family of distinction in the history of French journalism. The most important member of the family, generally regarded as the father of modern French journalism, Louis François Bertin (1766-1841), known as Bertin ainé, was born in Paris on the 14th of December 1766. He began his journalistic career by writing for the Journal Français and other papers during the French Revolution. After the 18th Brumaire he founded the paper, with which the name of his family has chiefly been connected, the Journal des Débats. He was suspected of royalist tendencies by the consulate and was exiled in 1801. He returned to Paris in 1804 and resumed the management of the paper, the title of which had been changed by order of Napoleon to that of Journal de l'Empire. Bertin had submitted to a rigorous censorship, and in 1811 the conduct, together with the profits, was taken over entirely by the government. In 1814 he regained possession and restored the old title and continued his support of the royalist cause—during the Hundred Days he delivered his Mémoire de Gâché till 1823, when the Journal des Débats became the recognized organ of the constitutional opposition. Bertin’s support was, however, given to the July monarchy after 1830. He died on the 13th of September 1841.

Louis François Bertin de Vaux (1771-1842), the younger brother of Bertin ainé, took a leading part in the conduct of the Journal des Débats, to the success of which his powers of writing greatly contributed. He entered the chamber of deputies in 1815, was made councillor of state in 1827, and a peer of France in 1830. The two sons of Bertin ainé, Edouard François (1797-1871) and Louis Marie François (1801-1854), were directors in succession of the Journal des Débats. Edouard Bertin was also a painter of some distinction.

BERTINORO, OBADIAH, Jewish commentator of the Mishnah, died in Jerusalem about 1500. Bertinoro much improved the status of the Jews in the Holy Land; before his migration thither the Jews of Palestine were in a miserable condition of poverty and persecution. His commentary on the Mishnah is the most useful of all helps to the understanding of that work. It is printed in most Hebrew editions of the Mishnah. Surenhusius, in his Latin edition of the last named code (Amsterdami, 1573), translated Bertinoro’s commentary.

BERTINORO, a town and episcopal see of Emilia, Italy, in the province of Forli, 8 m. S.E. direct of Forli and 5½ m. N. of the station of Forlimpopoli, and 800 ft. above sea-level. Pop. (1901) town, 3753; commune, 7786. The town commands a fine view to the north over the plain of Emilia and the lower course of the Po, itself lying on the foothills of the Appennines. It appears to have been first fortified by Frederick Barbarossa, and its castle stood frequent sieges in the middle ages. Polenta, 2½ m. to the south of it, was the birthplace of Francesca da Rimini. The castle is almost entirely ruined, but the church of S. Donato, of the Lombard period, with Byzantine capitals, is intact; Giosuè Carducci has written a fine ode on the subject (La Chiesa di Polenta, Bologna, 1897).

See C. Ricci, "Della Chiesa e castello di Polenta," in Atti Memorie della Deputazione di Storia patria per le province di Romagna, ser. iii. vol. iv. (1848), p. 31 seq. (T. A.)

BERTOLD (1442-1504), elector and archbishop of Mainz, son of George, count of Henneberg, entered the ecclesiastical profession, and after passing through a lower stage was made archbishop of Mainz in 1484. He appears to have been a firm supporter of law and order, an enemy of clerical abuses and a careful administrator of his diocese. Immediately after his election as archbishop he began to take a leading part in the business of the Empire, and in 1486 was very active in securing the election of Maximilian as Roman king. His chief work, however, was done as an advocate of administrative reform in Germany. During the reign of the emperor Frederick III. he had brought this question before the diet, and after Frederick’s death, when he had become imperial chancellor, he was the leader of the party who had suggested to the necessity for reform upon Maximilian at the diet of Worms in 1495. His proposals came to nothing, but he continued the struggle at a series of diets, and urged the Germans to emulate the courage and union of the Swiss cantons. He gained a temporary victory when the diet of Augsburg in 1500 established a council of regency (Reichsregiment), and in 1502 persuaded the electors to form a union to uphold the reforms of 1495 and 1500. The elector died on the 21st of December 1504. Bertold was a man of great ability and resourcefulness, and as a statesman who strove for an ordered and united Germany was far in advance of his age.

See J. Weiss, Berthold von Henneberg, Erzbishof von Mainz (Freiburg, 1866).

BERTOLD VON REGENSBURG (c. 1220-1272), the greatest German preacher of the later middle ages, was a native of Regensburg, and entered the Franciscan monastery there. From about 1250 onwards his fame as a preacher spread over all the German-speaking parts of the continent of Europe. He wandered from village to village and town to town, preaching to enormous audiences, always in the open air; the earnestness and straightforward eloquence with which he insisted that true repentance came from the heart, that pious pilgrimages and the absolution of the Church were mere outward symbols, appealed to all classes. He died in Regensburg on the 13th of December 1272. His German sermons, of which seventy-one have been preserved, are among the most powerful in the language, and form the chief monuments of Middle High German prose. His style is clear, direct and remarkably free from cumbrous Latin constructions; he employed, whenever he could, the pithy and homely sayings of the peasants, and is not reluctant to point his moral with a rough humour. As a thinker he shows little sympathy with that strain of medieval mysticism which is to be observed in all the poetry of his contemporaries.

The best edition of Bertold’s sermons is that by F. Pfeiffer and J. Strobl (2 vols., 1862-1880; reprinted, 1906); there is also a modern German version by F. Göbel (4th ed., 1906). The Latin sermons were edited by G. Jakob (1880); see C. W. Stromer, Bertold von Regensburg, der grofs Vokabredner des deutschen Mittelalters (1877), K. Unkel, Bertold von Regensburg (1882), and E. Bernhardt, Bruder Bertold von Regensburg (1905); A. E. Schönbach, Studien zur Geschichte der altdeutschen Predigt (Publications of the Vienna Academy, 1906).

BERTRAM, CHARLES (1723-1765), English literary impositor, was born in London, the son of a silk dyer. In 1747, being then teacher of English at the school for Danish naval cadets at Copenhagen, he went to Dr. Stukeley, the English antiquarian, who had discovered a manuscript written by a monk named Richard of Westminster, which corrected and supplemented the Itinerary of Antoninus in Britain. He subsequently sent to Stukeley a copy of various parts of the work and a facsimile of a few lines of the manuscript. These were so cleverly executed that they quite deceived the English palaeographers of the period. Stukeley, finding that a chronicler of the fourteenth century, Richard of Cirencester, had also been an inmate of Westminster Abbey, identified him with Bertram’s Richard of Westminster, and, in 1756, read an analysis of the “discovery” before the Society of Antiquaries, which was published with a copy of Richard’s map. In 1757 Bertram published at Copenhagen a volume entitled Britanniarum Gentium Historiae Antiquae Scriptores Tres. This contained the works of Gildas and Nennius and the full text of Bertram’s forgery, and though Bertram’s map did not correspond with that of Richard, Stukeley discarded the latter and adopted Bertram’s concoction in his Itinerarium Curiosum published in 1776. Although Thomas Reynolds in his Iter Britanniarum (1790), an edition of the British portion of the manuscript, “Itinerary,” was distinctly sceptical as to the value of Bertram’s manuscript, its authenticity was generally accepted until the middle of the 18th century. No original of the manuscript could then be found at Copenhagen, and B. B. Woodward, librarian of Windsor Castle, proved conclusively, by a series of articles in the Gentleman’s Magazine in 1866 and 1867, that
the supposed facsimile of calligraphy produced by Bertram was a blend of the style of various periods, while the greater portion of the didactic Latin in the book was a mere translation of 18th century English phraseology. Nevertheless, as late as 1792 a translation of Bertram’s forgery was included in Bohn’s Antiquarian Library as one of the Six English Chronicles, and there is no doubt that the work had a wide and misleading influence upon many antiquarian writers. Bertram died in 1765.

BERTRAND, HENRI GRATIEN, COMTE (1773–1844), French general, was born at Châteauroux. At the outset of the Revolution, he had just finished his studies, and he entered the army as a volunteer. During the expedition to Egypt, Napoleon named him colonel (1798), then brigadier-general, and after Austerlitz his aide-de-camp. His life was henceforth closely bound up with that of Napoleon, who had the fullest confidence in him, honouring him in 1813 with the title of grand marshal of the court. It was Bertrand who in 1809 directed the building of the bridges by which the French army crossed the Danube at Wagram. In 1813, after the battle of Leipzig, it was due to his initiative that the French army was not totally destroyed. He accompanied Napoleon to Elba in 1814, returned with him in 1815, held a command in the Waterloo campaign, and then, after the defeat, accompanied Napoleon to St. Helena. He was allowed to return to France until after Napoleon’s death, and then Louis XVIII. allowed him to retain his rank, and he was elected deputy in 1830. In 1840 he was chosen to go to bring Napoleon’s remains to France. He died at Châteauroux on the 31st of January 1844. His touching fidelity has made his name very popular in France.

BERTRICH, a village and watering place of Germany, in the Prussian Rhine province, in a narrow valley running down to the Mosel near Cochem. Its waters are efficacious in cases of gout, rheumatism and biliary affections. Pop. 500.

BÉRULLE, PIERRE DE (1575–1629), French cardinal and statesman, was born at Sérilly, near Troyes, on the 4th of February 1575. He was educated by the Jesuits and at the University of Paris. Soon after his ordination in 1599, he assisted Cardinal Duperron in his controversy with the Protestant Philippe de Mornay, and made numerous converts. He founded the Congregation of the French Oratory in 1611 and introduced the Carmelite nuns into France, notwithstanding the opposition of the friars of that order, who were jealous of his ascendency. Bérulle encouraged Descartes’ philosophical studies, and it was through him that the Samaritan Pentateuch, recently brought over from Constantinople, was inserted in Lejay’s Polyglot Bible. His treatise, Des Grandes de Jésus, was a favourite book with the Jansenists. He died on the 2nd of October 1629. His works, edited by P. Bourgoing (2 vols., 1644) were reprinted, by Migne in 1857.

See M. de Bérulle et les Carmélites; Le Père de Bérulle et l’oratoire de Jésus; Le Cardinal de Bérulle et Richelieu (3 vols., 1872–1876), by the Abbé M. Houssaye; and H. Sidney Lear’s Priestly Life in France in the Seventeenth Century (London, 1873).

BERVIE, or INVERERIE, a royal and police burgh of Kin- cardineshire, Scotland. Pop. (1901) 1297. It is situated at the mouth of Bervie Water and is the terminus of the North British railway’s branch line from Montrose, which lies 14 m. S.W. The leading industries include manufactures of woollens, flax and chemicals, and there is also a brisk trade in live-stock. Bervie unites with Arbroath, Brechin, Forfar and Montrose in returning one member (for the “Montrose burghs”) to parliament. David II., driven by stress of weather, landed here with his queen Joanna in 1341, and, out of gratitude for the hospitality of the townsfolk, granted them a charter, which James VI. confirmed. Hallgreen Castle, a stronghold of the 14th century, is maintained in repair. About one m. south is the fishing village of Gourdon (pop. 1197), where boat-building is carried on. There is a small but steady export business from the harbour, which has a pier and breakwater. St. Ternan’s, the Romanesque parish church of Arbuthnott, 2½ m. north-west, stands on the banks of the Bervie. In the chapel dedicated to St. Mary, which was afterwards added to it, is the burial-place of the Arbuthnots, who took their title from the estate in 1644. John Arbuthnot, Queen Anne’s physician and the friend of Swift and Pope, was a native of the parish. Kinneff, 2 m. north, is of interest as the place where the Scottish regalia were concealed during the siege of Dunnotar Castle.

BERWICK, JAMES FITZJAMES, DUKE OF (1670–1734), marshal of France, was the natural son of James, duke of York, afterwards James II. of England, by Arabella Churchill (1648–1730), sister of the great duke of Marlborough. He was born at Moulins (Bourbonnais) on the 21st of August 1670. He received his education in France at the hands of the Jesuits, and at the age of fifteen, his father having succeeded to the throne, he was sent to learn the business of a soldier under the famous general of the empire, Charles de Lorraine. He served his first campaign in Hungary, and was present at the siege of Buda. He returned to France and joined the army on the Rhine, and took part in the battle of Breitenfeld in 1683. In 1687 created duke of Berwick, earl of Teignmouth and Baron Bosworth. He then went out afresh to Hungary and was present at the battle of Mohacz. On his return to England he was made K.G., colonel of the 3rd troop of horse guards (Royal Horse Guards Blue) and governor of Portsmouth, but soon afterwards the revolution forced him to flee to France. He served under James II. in the campaign in Ireland, and was present at the battle of the Boyne. For a short time he was left in Ireland as commander-in-chief, but his youth and inexperience unfitted him for the post, and he was a mere puppet in stronger hands. He then took service in the French army, fought under Marshal Luxembourg in Flanders, and took part in the battles of Steinkirk and Neerwinden, at the latter of which he was taken prisoner. He was, however, immediately exchanged for the duke of Ormond, and afterwards he served under Villeroy. In 1695 he married the widow of Patrick Sarsfield, who died in 1698. His second marriage, with Anne Bulkeley, took place in 1700. As a lieutenant-general he served in the campaign of 1704, after which he became naturalized as a French subject in order to be eligible for promotion. He took command of the French army in Spain. So highly was he now esteemed for his courage, abilities and integrity, that all parties were anxious to have him on their side (Élégie, de Montesquieu). His tenure of the command was, however, very short, and after one campaign he was replaced by the Marshal de Téssé. In 1705 he commanded against the Camisards in Languedoc, and when on this expedition he is said to have carried out his orders with remorseless rigour. His successful expedition against Nice in 1706 caused him to be made marshal of France, and in the same year he returned to Spain as commander-in-chief of the Franco-Spanish armies. On the 25th of April 1707, the duke won the great and decisive victory of Almanza, where an Englishman at the head of a French army defeated Ruivigny, earl of Galway, a Frenchman at the head of an English army. The victory established Philip V. on the throne of Spain. Berwick was made a peer of France by Louis XIV., and duke of Liria and of Xerex and lieutenant of Aragon by Philip V. Thenceforward Berwick was recognized as one of the greatest generals of his time, and held in nearly all the theatres of war. From 1709 to 1712 he defended the south-east frontier of France in a series of campaigns which, unmarked by any decisive battle, were yet models of the art of war as practised at the time. The last great event of the War of the Spanish Succession was the storming of Barcelona by Berwick, after a long siege, on the 11th of September 1714. Three years later he was appointed military governor of the province of Guinée, in which post he became intimate with
Monteszquieu. In 1718 he found himself under the necessity of once more entering Spain with an army; and this time he had to fight against Philip V., the king who owed chiefly to Berwick's courage and skill the safety of his throne. One of the marshal's sons, known as the duke of Liria, was settled in Spain, and was counselled by his father not to shrink from doing his duty and fighting for his sovereign. Many years of peace followed this campaign, and Marshal Berwick was not again called to serve in the field till 1732. He advised and conducted the siege of Philipburg, and while the siege was going on was killed by a cannon-shot on the 12th of June 1734. Cool, self-possessed and cautious as a general, Marshal Berwick was at the same time not wanting in audacity and swiftness of action. He was a true general of the 18th century, not less in his care for the lives of his men than in his punctiliousness and rigidity in matters of discipline.

The Memoirs of Marshal Berwick, revised, annotated and continued by the Abbé Hooke, were published by the marquis's grandson in 1778. Monteszquieu made many contributions to this.

BERWICKSHIRE, a county of Scotland, forming its south-eastern extremity, bounded N. by Haddingtonshire and the North Sea; E. by the North Sea; S.E. by the county of the borough and town of Berwick; S. by the Tweed and Roxburghshire, and W. by Mid-Lothian. Its area is 292,577 acres or 457 sq. m., and it has a coast-line of 21 m. The county is naturally divided into three districts: Lauderdale, or the valley of the Leader, in the W.; Lammermuir, the upland district occupied by the hills of that name in the N.; and the Merse (the March or Borderland, giving a title to the earls of Wemyss), the largest district, occupying the S.E. The Lammermuirs are a range of round-backed hills, whose average height is about 1000 ft., while the highest summit, Says Law, reaches 1749 ft. From these hills the Merse stretches to the S. and E., and is a comparatively level tract of country. The coast is lofty, rocky and precipitous, broken by ravines and not accessible, except at Eyemouth Harbour, for small vessels, and at Cocklington and Burnmouth for fishing boats.

St Ab's Head, a promontory with a lighthouse upon it, rises to 310 ft. The Eye is the only river of any size which falls directly into the sea. The others—the Leader, the Eden, the Leet and the Whiteadder with its tributaries, the Blackadder and the Dye—all flow into the Tweed. Of these the largest and most important is the Whiteadder, which has its source in the parish of Whittingham on the East Lothian side of the Lammermuirs, and, following a sinuous course of 35 m., joins the Tweed within the bounds or liberties of Berwick. There are small lochs at Cocklington, Legerwood, Spottiswoode, the Hirsel, near Coldstream, Hume Moss on Greenlaw Moor, and tiny sheets of water near Duns and Mersingston.

Geology.—The north portion of the county embraces that part of the Silurian tableland of the south of Scotland which stretches from the Lammermuir Hills to St Ab's Head. The strata consist mainly of grits, greywackes, flag and shales, repeated by innumerable folds, trending north-east and south-west, which are laid bare in the great cliff section between East Castle and St Ab's Head. This section of the tableland includes sediments, chiefly of Taranonn age, which form a belt 10 m. across from the crest of the Lammermuirs Hills to a point near Westruther and Longformacus. In the Earnsleuch Burn north-east of Lauder representatives of Llandovery, Caradoc and Llandeilo rocks, together with the Arenig cherts, appear along an antiformal fold in the midst of the younger strata. Again in the extreme north-west of the county near Chancelkirk and to the north of the Taranon belt radiolarian cherts and black shales with graptolites of Upper Llandoilo and Caradoc age are met with. The Lower Old Red Sandstone rocks, which rest unconformably on the folded and denuded Silurian strata, appear at Eyemouth and Reston Junction, and at St Ab's Head are associated with contemporaneous volcanic rocks which are evidently on the same horizon as the interbedded lavas of Lower Old Red age in the Cheviots. The intrusive igneous materials of this period are represented by the granitic mass of Cockburn Law and the porphyrites of the Dirrington Laws. The Upper Old Red Sandstone, consisting of conglomerates and sandstones, rest unconformably on the Silurian platform as at Siccar Point and on the lower division of that system. The age of these beds has been determined by the occurrence of remains of Hedopus minutus in the sandstones at Earlston and in the Whiteadder north of Duns. On the Black Hill of Earlston these strata are traversed by a sheet of trachyte resembling the type of rock capping the Eildon Hills (see Roxburghshire: Geology). Overlying the strata just described there is a succession of volcanic rocks extending from Greenlaw southwards by Stichill and Kelso to Carham, which, at several localities, are followed by a band of cornstone resembling that near the top of the Upper Old Red Sandstone in the midland valley of Scotland. Next in order comes a great development of the Cementstone group of the Carboniferous system which spreads over nearly the whole of the low ground of the Merse and attains a great thickness. At Marshall Meadows north of Berwick-on-Tweed, thin bands of marine limestone occur, which probably represent some of the concretionary beds above the Fell sandstones south of Spittal.

Climate and Agriculture.—Owing to the maritime position, the winter is seldom severe in the lowland districts, but spring is a trying season on account of the east winds, which often last into summer. The mean annual rainfall is 30½ in. and the average temperature for the year is 47° F., for January 37° F., and for July 58-6° F. The climate is excellent as regards both the health of the inhabitants and the growth of vegetation. The soils vary, sometimes even on the same farm. Along the rivers is a deep rich loam, resting on gravel or clay, chiefly the former. The less valuable clay soil of the Merse has been much improved by drainage. The more sandy and gravelly soils are suitable for turnips, of which great quantities are grown. Oats and barley are the principal grain crops, but wheat also is raised. The flocks of sheep are heavy, and cattle are pastured in considerable numbers. Large holdings predominate—indeed, the average size is the highest in Scotland—and scientific farming is the rule. The labourers, who are physically well developed, are as a whole frugal, industrious and intelligent, but somewhat migratory in their habits. This feature in their character, which they may have by inheritance as Borderers, has admirably fitted them for colonial life, to which the scarcity of industrial occupation has largely driven the surplus population.

Other Industries.—Next to agriculture the fisheries are the most important industry. The Tweed salmon fisheries are famous, and the lesser rivers of the Merse are held in high esteem by anglers. Eyemouth, Burnmouth, Coldingham and Cove are engaged in the sea fisheries. Cod, haddock, herring, ling, lobsters and crabs are principally taken. The season for herring is from May to the middle of September and for white fish from October to the end of May. Coal, copper ore and ironstone exist in too small quantities to work, and the limestone is so far from a coal district as to be of little economic value. Earlston sends out gingham and woolen cloths. At Cumnide on the Whiteadder, blankets and plaid are manufactured, and paper is made at Chirnside. The other manufactures are all connected with agriculture, such as distilleries, breweries, tanneries, &c. The trade is also mainly agricultural. Fairs are held at Duns, Lauder, Coldstream and Greenlaw; but the sales of cattle and sheep mostly take place at the auction marts at Reston, Duns and Earlston. There are grain markets at Duns and Earlston. Berwick, from which the county derives its name, is still its chief market. There is, however, no legal or fiscal connexion between the county and the borough.

The North British railway monopolizes the communications of the county. The system serves the district from Berwick to Cockburnspath, and there is a branch from Reston to St Boswells.

Population and Government.—The population of Berwickshire was 32,290 in 1891 and 30,824 in 1901, in which year the number of persons speaking Gaelic and English was 74, and one person spoke Gaelic only. The only considerable towns are Eyemouth (pop. in 1901. 2436) and Duns (2205). The county returns one
member to parliament. Lauder is the only royal burgh, and Duns the county town, a status, however, which was held by Greenlaw from 1690 to 1833, after which it was shared by both towns until conferred on Duns alone. Berwickshire forms a shire district with Roxburgh and Selkirk, and there is a resident sheriff-substitute at Duns, who sits also at Greenlaw, Coldstream, Ayton and Lauder. In addition to board and voluntary schools throughout the county, there is a high school, which is also a technical school, at Duns, and Coldstream and Lauder public schools have secondary departments. Duns school is subsidized by the county council, which pays the expenses of students attending it from a distance.

History.—Traces of Roman occupation and of ancient British settlement exist in various parts of the Merse. Edin's or Entin's Hall, on Cockburn Law, 4 m. north of Duns, is still called the Pech's or Pict's House, and is one of the very few brochs found in the Lowlands. After the Romans withdrew (406) the country formed part of the Saxon kingdom of Northumbria, and the inhabitants were converted to Christianity through the missionary efforts of Modan in the 6th, and Oswald, Aidan and Cuthbert (traditionally believed to have been born in the vale of the Leader) in the 7th centuries. The Northmen invaded the seaboard, but the rugged coast strongly resists invasion; domestic Daniel Burnswick was taken in 886, and destroyed the monastery at Coldingham, founded about 650 by Ebba, daughter of Æthelfrith, king of Northumbria, after whom the adjoining promontory of St Abb's Head was named. After the battle of Carham (1018) the district, which then constituted part of the division of Lothian, was annexed to Scotland. Birgham (pron. Birjam), 31 m. west of Coldstream, was the scene of the conference in 1188 between William the Lion and the bishop of Durham, which discussed the attempt of the English church to assert supremacy over the Scottish. Here also met in 1289 a convention of the Scots nobles to consider the projected marriage of Prince Edward of England to the Maid of Norway; and here was signed in 1296 the treaty of Birgham, assuring the independence of Scotland. During the long period of international strife the shire was repeatedly overrun by armies of the English and Scots kings, who were constantly fighting for the ancient frontier town of Berwick. It was finally ceded to England in 1482, and the people afterwards gradually settled down peacefully. The former town of the Weet and Tweed near Coldstream gave access to south-eastern Scotland. Edward I. crossed it with his army in 1296, encamping at Hutton the day before the siege of Berwick, and it was similarly employed as late as 1640, when the marquess of Montrose led the Covenanters on their march to Newcastle, although James VI. already caused a bridge to be constructed from Berwick to Tweedmouth. There are several places of historic interest in the county. Upon the site of the monastery at Coldingham King Edgar in 998 founded a Benedictine priory, which was one of the oldest monastic institutions in Scotland and grew so wealthy that James III. annexed its revenues to deprive his hostages, a step that precipitated the revolt of the nobles (1488). The priory was seriously damaged in the earl of Hertford's inroad in 1545, and Cromwell blew up part of the church in 1650. The chancel (without aisles) was repaired and used as the parish church. The remains contain some fine architectural features, such as, on the outside, the Romanesque arcades surmounted by pointed windows at the east end, and in the interior, the Early Pointed triforium. On the coast, about 4. m. north-west of Coldingham, are the ruins of Fast Castle—the "Wolf's Crag" of Scott's "Bride of Lammermoor"—situated on a precipitous headland. On Sir Patrick Hume it passed to Sir Robert Logan of Restalrig, who is alleged to have been one of the Gowrie conspirators, and to have intended to imprison James VI. within its walls (1600). Four miles west is the Pease or Peaths bridge, built by Thomas Telford in 1786 across the deep pass which was of old one of the strongest natural defences of Scotland. The bridge is 125 ft. high, 300 ft. long and 16 ft. wide. Near it are the ruins of Cockburnspath Tower, once a strong fortress and supposed to be the "Ravenwood" of the Bride of Lammermoor. In the south-west of the shire besides Dryburgh Abbey (q. v.) there are, at Earlston, the remains of the castle that was traditionally the residence of Thomas the Rhymer. Home Castle, the ancient seat of the Home family, a picturesque ruin about 1. m. south of Greenlaw, is so conspicuously situated as to be visible from nearly every part of the county. Coldstream and Lamberton, being close to the Border, were both resettled to (like Gretna Green in the west) by eloping couples for clandestine marriage. In Lamberton church was signed in 1502 the contract for the marriage of James IV. and Margaret Tudor, which led a century later, to the union of the crowns of Scotland and England.

Robson, The Churches and Churchyards of Berwickshire (Kelso, 1875); W. H. Groome, A Short History of Scotland (Kelso, 1887); A. J. Tait, Two Centuries of Border Church Life (Kelso, 1889); Margaret Warrender, Marchmont and the Humes of Polwarth (Edinburgh, 1894); W. K. Hunter, History of the Priory of Coldingham (Edinburgh, 1898).

BERWICK-UPON-TWEED, a market town, seaport, municipal borough and county in itself, of England, at the mouth of the Tweed on the north bank, 339 m. N. by W. from London. Pop. (1901) 15,437. For parliamentary purposes it is in the Berwick constituency. It is a market town, and the junction on the East Coast route from London to Scotland between the North Eastern and North British railways, a branch of the company first named running up the Tweed valley by Coldstream and Kelso. The town lies in a bare district on the slope and flat summit of an abrupt elevation, higher ground rising to the north and south across the river. It has the rare feature of a complete series of ramparts surrounding it. Those to the north and east are formed of earth faced with stone, with bastions at intervals and a ditch now dry. They are of Elizabethan date, but there are also lines of much earlier date, the fortifications of Edward I. Much of these last has been destroyed, and threatened encroachment upon the remaining relics so far aroused public feeling that in 1905 it was decided that the Board of Works should take over these ruins, including the Bell Tower, from the town council, and enclose them as national relics. The Bell Tower, from which alarms were given when border raiders were observed, is in fair preservation. There are slight remains of the castle, which fell into deep decay after the crowns of England and Scotland. There are no traces of the churches, monasteries or other principal buildings of the ancient town. The church of Holy Trinity is a plain building without steeple, of the time of Cromwell. Of modern places of worship, the most noteworthy is Wallace Green United Presbyterian church (1859). The chief public building is the town hall (1790), a stately classic building surmounted by a lofty spire. Educational institutions include an Elizabethan grammar school and a blue-coat school; and there is a local museum. Two bridges connect the town with the south side of the Tweed. The older, which is very substantial, was finished in 1634, having taken twenty-four years in building. It has fifteen arches, and is 924 ft. long, but only 17 ft. wide. A unique provision for its upkeep out of Imperial funds dates from the reign of Charles II. The other, the Royal Border Bridge, situated a quarter of a mile up the river, is a magnificent railway viaduct, 126 ft. high, with twenty-eight arches, which extends from the railway station, a castellated building on part of the site of the old castle, to a considerable distance beyond the river. This bridge was designed by Robert Stephenson and opened by Queen Victoria in 1859.

The reach of the river from the old bridge to the mouth forms the harbour. The entrance to the harbour is protected by a stone pier, which stretches half a mile south-east from the north bank of the river mouth. The depth of water at the bar is 17 ft. at ordinary tides, 22 ft. at spring tides, but the channel is narrow, a large rocky portion of the harbour on the north side being dry at low water. There is a wet dock of 3½ acres. Principal exports are grain, coal and fish; imports are bones and bone-ash, manure stuffs, linseed, salt, timber and iron. The herring and other sea fisheries are of some value, and the salmon fishery, in the hands of a company, has long been famous. A fair is held...
BERYL. — BERYLLIUM 817

annually at the end of May. There are iron-works and boat-building yards.

The custom of specially mentioning Berwick-upon-Tweed after Wales, though abandoned in acts of parliament, is retained in certain local acts. The title of "county in itself" also helps to recall its ancient history. The liberties of the borough, commonly called Berwick Bounds, include the towns of Spittal, at the mouth, and Tweedmouth immediately above it, on the south bank of the river. The first is a watering-place (pop. 2074), with pleasant sands and a chalybeate spa; the second (pop. 3086) has iron foundries, engineering works and fish-curing establishments. Berwick-upon-Tweed is governed by a mayor, 6 aldermen and 18 councillors. Area, 3696 acres.

Very little is known of the history of Berwick before the Conquest. It was not until the Tweed became the boundary between England and Scotland in the 12th century that Berwick as the chief town on that boundary became really important. Until the beginning of the 14th century Berwick was one of the four royal boroughs of Scotland, and although it possesses no charter granted before that time, an inquisition taken in Edward III.'s reign shows that it was governed by a mayor in the reign of Alexander III., who granted the town to the said mayor and the commonalty for an annual rent. After Edward I. had conquered Berwick in 1302 he gave the burgesses another charter, no longer existing but quoted in several inquisitions. The last burgesses has the borough with a gild merchant. The burgesses were given the right to elect annually their mayor, who with the commonalty should elect four bailiffs. They were also to have freedom from toll, portage, &c., two marks to the sixpenny pound of Man-Frith, and fair casting from the feast of Holyrood to that of the nativity of St John the Baptist. Five years later, in 1307, the mayor and burgesses received another charter, granting them their town with all things that belonged to it in the time of Alexander III., for a fee-rent of 500 marks and a yearly rent of 10 marks. In 1319 Berwick was given to the Scotch people for their expenses in defending the town, which was enclosable their town with a wall. While the war with Scotland dragged on through the early years of the reign of Edward II., the fortification of Berwick was a matter of importance, and in 1357 the mayor and burgesses hired an engineer to make up the sum of good marks; but in the following year, "owing to their default," the Scots entered and occupied it in spite of a truce between the two kingdoms. After Edward III. had recovered Berwick the inhabitants petitioned for the recovery of their prison called the Bell-tower, the symbol of their independence, which their predecessors had built before the time of Alexander III., and which had been granted to William de Keythorpe when Edward I. took the town. Edward IV. in 1476 made it a town and chartered of Edward I., and in 1537, evidently to encourage the growth of the borough, granted that all who were willing to reside there and desirous of becoming burgesses should be admitted as such on payment of a fine. In 1482 early charters were confirmed by most of the townsfolk, but until 1567 they did not reside in the town, with an exception made in 1604; but on his accession to the English throne, Berwick of course lost its importance as a frontier town. Berwick was at first represented in the council of the four boroughs and in 1266 in Robert Bruce's government. After being taken by the English it remained unrepealed until it was re-taken by the Scots, when it sent two members to the parliament at Edinburgh from 1476 to 1479. In 1482 the burgesses were allowed to send two members to the English parliament, and were represented there until 1826. The town was included in the Berwick-upon-Tweed division of the county of Northumberland. No manufactures are mentioned as having been carried on in Berwick, but its trade, chiefly in the produce of the surrounding counties, was important in the 12th century. It has been noted for salmon fishery in the Tweed from very early times. There was a bridge over the Tweed at Berwick in the time of Alexander and John, kings of Scotland, but it was broken down in the time of the latter and not rebuilt until the end of the 14th century.

See Victoria County History, Northumberland; Fuller, History of Berwick-upon-Tweed, &c. (1790); John Scott, Berwick-upon-Tweed: History of the Town and Guild (1888).

BERYL, a mineral containing beryllium and aluminium in the form of a silicate; its formula is Be₂Al₂Si₂O₇. The species includes the emerald (q.v.), the aquamarine (q.v.) and other transparent varieties known as "precious beryl," with certain coarse varieties unfit for use as gem-stones. The name comes from the Gr. βηρυλλος, a word of uncertain etymology applied to the beryl and probably several others. It is notable that the relation of the emerald to the beryl, though proved only by chemical analysis, was conjectured at least as far back as the time of Pliny.

Beryl crystallizes in the hexagonal system, usually taking the form of long six-sided prisms, striated vertically and terminated with the basal plane, sometimes associated with various pyramidal faces (see fig.). It cleaves rather imperfectly parallel to the base. The colour of beryl may be blue, green, yellow, brown or rarely pink; while in some cases the mineral is colourless. The specific gravity is about 2·7, and the hardness 7·5 to 8, so that for a gem-stone beryl is comparatively soft. Whilst the gem-varieties are transparent, the coarse beryl may be opaque. The transparent crystals are pleochroic—a character well marked in emerald.

Beryl was much prized as a gem-stone by the ancients, and Greek intaglios of very fine workmanship are extant. The Roman jewellers, taking advantage of the columnar form of the natural crystal, worked it into long cylinders for ear-pendants. It was a favourite stone with the artists of the Renaissance, but in modern times has lost popularity, except in the form of emerald, which remains one of the most valued gem-stones. It is notable that English lapidaries of the 18th century often included the sard under the term beryl—a practice which has led to some confusion in the nomenclature of engraved gems.

Beryl occurs as an accessory in the constitution of many gneissic rocks, especially in veins of pegmatite, whilst it is also found in gneiss and in mica-schist. Rolled pebbles of beryl occur, with topaz, in Brazil, especially in the province of Minas Geraes. Crystals are found in drusy cavities in granite in the Ural, notably near Mursinka; in the Altai Mountains, which have yielded very long prismatic crystals; and in the mining district of Nerchinsk in Siberia, principally in the Adun-Chalan range, where beryl occurs in veins of topaz-rock piercing granite. Among European localities may be mentioned Elba, good crystals being occasionally found in the tourmaline-granite of San Piero. In Ireland excellent crystals of beryl occur in druses of the granite of the Mourne Mountains in Co. Down, and others less fine are found in the highlands of Donegal, whilst the mineral is also known from the Leinster granite. It occurs likewise in the granite of the Grampians in Scotland, and is not unknown in Cornwall, specimens having been found, with topaz, apatite, &c., in joints of the granite of St Michael's Mount.

Many localities in the United States yield beryl, sometimes sufficiently fine to be cut as a gem. It is found, for example, at Hillsboro, Mass., in Alexander county, N.C.; at Haddam and Monroe, Conn.; at Stone, Conn.; at Albany, in Oxford county, Maine; at Royalston, Mass.; and at Mt. Antero, Colorado, where it occurs with phencite. Beryl of beautiful pink colour occurs in San Diego county, California. Coarse beryl, much rifted, is found in crystals of very large size at Granton and Acworth, N.H.; a crystal from Grafton weighing more than 2½ tons. A colourless beryl from Goshen, Mass., has been called Goshenite; whilst crystals of coarse yellow beryl from Rubislaw quarry in Aberdeenshire, Scotland, have been termed Davosdite.

Beryl suffers alteration by weathering, and may thus pass into kaolin and mica. (F. W. R.*).

BERYLLIUM, or GLUCINUM (symbol Be, atomic weight 9·1), one of the metallic chemical elements, included in the same sub-group of the periodic classification as magnesium. It was prepared in the form of its oxide in 1798 by L. N. Vauquelin (Ann. de chimie, 1798, xxvi. p. 155) from the mineral beryl, and though somewhat rare, is found in many minerals. It was first obtained, in an impure condition, in 1828 by A. A. Bussy (1794-1882) and F. Wöhler by reducing the chloride with potassium, and in 1855 H. J. Debray prepared it in the compact state, by reducing the volatile chloridite with potassium, in an atmosphere of nitrogen. F. L. Nilson and O. Petterson (Wied. Ann. 1878, iv. p. 554) have also prepared the metal by heating beryllium potassium fluoride with sodium; P. M. Lebeau (Comptes rendus, 1895-1896, vols. 120-127) has obtained it in lustrous hexagonal crystals by electrolyzing the double fluoride of beryllium and sodium or potassium with an excess of...
beryllonite—

It is a malleable metal, of specific gravity 1-64 (Nilson and Pettersson) and a specific heat of 0-4079. Its melting point is not known. When hot it takes fire on heating in air, but is permanent at ordinary temperatures in oxygen or air; it is readily attacked by hydrochloric and sulphuric acids, but scarcely acted on by nitric acid. It is also soluble in solutions of the caustic alkalis, with evolution of hydrogen a behaviour similar to that shown by aluminium. It combines readily with fluorine, chlorine and bromine, and also with sulphur, selenium, phosphorus, &c.

Considerable discussion has taken place at different times as to the position which beryllium should occupy in the periodic classification of the elements, and as to whether its atomic weight should be 9-1 or 13-65, but the weight of evidence undoubtedly favours its position in Group II, with an atomic weight 9-1 (O=16) (see Nilson and Pettersson, Berichte, 1880, 15, p. 1451; 1884, 17, p. 987; B. Brauner, Berichte, 1881, 14, p. 53; T. Carneley, Journal of Chem. Soc., 1879, xxxv, p. 563; 1880, xxvii., p. 125, and W. N. Hartley, Journal of Chem. Soc., 1883, xliii. p. 316).

The specific heat of beryllium has been calculated by L. Meyer (Berichte, 1886, 15, p. 1780) from the data of L. F. Nilson and O. C. Linköping, he was elected to the professorship of chemistry in the Caroline medico-chirurgical institution of that city. The Stockholm Academy of Sciences elected him a member in 1808, and in 1818 he became its perpetual secretary. The same year he was ennobled by Charles XIV., who in 1835 further made him a baron. His death occurred at Stockholm on the 7th of August 1848. During the first few years of his scientific career Berzelius was mainly engaged on questions of physiological chemistry, but about 1867 he began to devote himself to what he made the chief object of his life—the elucidation of the composition of chemical compounds through study of the law of multiple proportions and the atomic theory. Perceiving the exact determination of atomic and molecular weights to be of fundamental importance, he spent ten years in ascertaining that constant for some two thousand simple and compound bodies, and the results he published in 1818 attained a remarkable standard of accuracy, which was still further improved in a second table that appeared in 1826. He used oxygen—in his view the pivot round which the whole of chemistry revolves—as the basis of reference for the atomic weights of other substances, and the data on which he chiefly relied were the proportions of oxygen in oxygen compounds, the doctrines of isomorphism, and Gay Lussac's law of volumes. When Volta's discovery of the electric cell became known, Berzelius, with W. Hisinger (1766-1832), began experiments on the electrolysis of salt solutions, ammonia, sulphuric acid, &c., and later this work led him to his electrochemical theory, a full exposition of which he gave in his memoir on the Theory of Chemical Proportions and the Chemical Action of Electricity (1814). This theory was founded on the supposition that the atoms of the elements are electrically polarized, the positive side of one element corresponding to the negative side of another, and from it followed his dualistic hypothesis, according to which compounds are made up of two electrically different components. At first this hypothesis was confined to inorganic chemistry, but subsequently he extended it to organic compounds, which he saw might similarly be regarded as containing a group or groups of atoms—a compound radicle—in place of simple elements. Although his conception of the nature of compound radicles did not long retain general favour—indeed he himself changed it more than once—he is entitled to rank as one of the chief founders of the radicle theory. Another service of the utmost importance which he rendered to the study of chemistry was in continuing and extending the efforts of Lavoisier and his associates to establish a convenient system of chemical nomenclature. By using the initial letters of the Latin

Nilson and O. C. Linköping, the Chemistry and Literature of Beryllium (1909).

BERZELIUS, a mineral phosphate of beryllium and sodium, NaBePO₄, found as highly complex orthorhombic crystals and as broken fragments in the disintegrated material of a granitic vein at Stoneham, Maine, where it is associated with felspar, smoky quartz, beryl and columbite. It was discovered by Prof. E. S. Dana in 1888, and named beryllonite because it contains beryllium in large amount. The crystals vary from colourless to white or pale yellowish, and are transparent with a vitreous lustre; there is a perfect cleavage in one direction. Hardness 4-5; specific gravity 2-843. A few crystals have been cut and facetted, but, as the refractive index is no higher than that of quartz, they do not make very brilliant gem-stones.

BERZELIUS, JÖHN CARL, born at Växjö, Sweden, November 15, 1779, died at Stockholm, April 20, 1853. He was appointed professor of botany and pharmacy at Stockholm in the same year, he became full professor in 1807, and from 1815 to 1832 was professor of chemistry in the Caroline medico-chirurgical institution of that city. The Stockholm Academy of Sciences elected him a member in 1808, and in 1818 he became its perpetual secretary. The same year he was ennobled by Charles XIV., who in 1835 further made him a baron. His death occurred at Stockholm on the 7th of August 1848. During the first few years of his scientific career Berzelius was mainly engaged on questions of physiological chemistry, but about 1867 he began to devote himself to what he made the chief object of his life—the elucidation of the composition of chemical compounds through study of the law of multiple proportions and the atomic theory. Perceiving the exact determination of atomic and molecular weights to be of fundamental importance, he spent ten years in ascertaining that constant for some two thousand simple and compound bodies, and the results he published in 1818 attained a remarkable standard of accuracy, which was still further improved in a second table that appeared in 1826. He used oxygen—in his view the pivot round which the whole of chemistry revolves—as the basis of reference for the atomic weights of other substances, and the data on which he chiefly relied were the proportions of oxygen in oxygen compounds, the doctrines of isomorphism, and Gay Lussac's law of volumes. When Volta's discovery of the electric cell became known, Berzelius, with W. Hisinger (1766-1832), began experiments on the electrolysis of salt solutions, ammonia, sulphuric acid, &c., and later this work led him to his electrochemical theory, a full exposition of which he gave in his memoir on the Theory of Chemical Proportions and the Chemical Action of Electricity (1814). This theory was founded on the supposition that the atoms of the elements are electrically polarized, the positive side of one element corresponding to the negative side of another, and from it followed his dualistic hypothesis, according to which compounds are made up of two electrically different components. At first this hypothesis was confined to inorganic chemistry, but subsequently he extended it to organic compounds, which he saw might similarly be regarded as containing a group or groups of atoms—a compound radicle—in place of simple elements. Although his conception of the nature of compound radicles did not long retain general favour—indeed he himself changed it more than once—he is entitled to rank as one of the chief founders of the radicle theory. Another service of the utmost importance which he rendered to the study of chemistry was in continuing and extending the efforts of Lavoisier and his associates to establish a convenient system of chemical nomenclature. By using the initial letters of the Latin
(occasionally Greek) names of the elements as symbols for them, and adding a small numeral subscript, to show the number of atoms of each element in a compound, he introduced the present system of chemical notation (see Chemistry). Mention should also be made of the numerous improvements he effected in analytical methods and the technique of the blowpipe (über die Anwendung des Löthrohres, 1820), of his classification of minerals on a chemical basis, and of many individual researches such as those on tellurium, selenium, silicon, thorium, titanium, zirconium and molybdenum, most of which he isolated for the first time.

Apart from his original memoirs, of which he published over 250, mostly in Swedish in the Transactions of the Stockholm Academy, his remarkable literary activity is attested by his Lehrbuch der Chemie, which went through four editions (first 1803-1818, fifth 1843-1848) and by his Jahresbericht or annual report on the progress of physics and chemistry, prepared at the instance of the Stockholm Academy, of which he published 27 vols. (1821-1848).

BES, or BÉSAS (Egypt. Æs or Æsa), the Egyptian god of recreation, represented as a dwarf with broad head, goggle eyes, protruding tongue, shaggy beard, a bushy tail seen between his bow legs hanging down behind (sometimes clearly as part of a skin girdle) and usually a large crown of feathers on his head. A Bes-like mask was found by Petrie amongst remains of the twelfth dynasty, but the earliest occurrence of the god is in the temple of the queen Hatchepсут at Deir el Bahri (c. 1500 B.C.), where he is figured along with the hippopotamus goddess as present at the queen’s birth. His figure is that of a grotesque mountebank, intended to inspire joy or drive away pain and sorrow, his hideousness being perhaps supposed actually to scare away the evil spirits. In his joyous aspect Bes plays the harp or flute, dances, &c. He is figured on mirrors, ointment vases and other articles of the toilet. Amulets and ornaments in the form of the figure or mask of Bes are common after the New Kingdom; he is often associated with children and with childbirth and is figured in the “birth-houses” devoted to the cult of the child-god. Perhaps the earliest known instance of his prominent appearance of large size in the sculptures of the temples is under Taharqa, at Jebel Barkal, Nubia, at the beginning of the 7th century B.C. As the protector of children and others he is the enemy of noxious beasts, such as lions, crocodiles, serpents and scorpions. Large wooden figures of Bes are generally found to contain the remains of a human focetus. In the first centuries of our era an oracle of Besas was consulted at Abydos, where A. H. Sayce has found graffiti concerning him, and prescriptions exist for consulting Besas in dreams.

It has been held that Bes was of non-Egyptian origin, African, as Wiedemann, or Arabian or even Babylonian, as W. Max Müller contends; he is sometimes entitled “coming from the Divine Land” (i.e. the East or Arabia), or “Lord of Puoni” (Punt), i.e. the African coast of the Red Sea; his effigy occurs also on Greek coins of Arabia. It is remarkable also that, contrary to the usual rule, he is commonly represented in Egyptian sculptures and paintings with full face instead of in profile. But the connexion of the god with Puoni may have grown out of the fact that dwarf dancers were especially brought to Egypt from Ethiopia and Puoni.

BESANÇON, a city of eastern France, capital of the department of Doubs, 76 m. E. of Dijon by the Paris-lyon railway, Pop. (1906) town, 41,760; commune, 56,168. It is situated on the left bank of the river Doubs, 820 ft. above sea-level at the foot of the western Jura, and is enclosed by hills in every direction. The Doubs almost surrounds the city proper forming a peninsula, the neck of which is occupied by a height crowned by the citadel; on the right bank lie populous industrial suburbs. The river is bordered by fine quays, and in places by the shady promenades which are a feature of Besançon. On the right bank there is a fine bathing establishment in the Moulière quarter, supplied by the saline springs of Misery. The cathedral of St. Jean, the chief of the numerous churches of the town, was founded in the 4th century but has often undergone reconstruc-
tion and restoration; it resembles the Rhénish churches of Germany in the possession of apses at each of its extremities. Several styles are represented in its architecture which for the most part is the work of the 12th, 13th and 14th centuries; the eastern apse and the tower date from the reign of Louis XV. In the interior there are a “Madonna and Child” of Fra Bartolommeo and a number of other paintings and works of art. The archiepiscopal palace adjoining the cathedral is a building of the 18th century. The church of St. Madeleine belongs to the 18th and 19th centuries. The Palais de Granvelle, in the heart of the town, was built from 1534 to 1540 by Nicolas Perrenot de Granvelle, chancellor of Charles V., and is the most interesting of the secular buildings. It is built round a square interior court surrounded by arcades, and is occupied by learned societies.

The hôtel de ville dates from the 16th century, to which period many of the old mansions of Besançon also belong. The law-court, rebuilt in recent times, preserves a Renaissance façade and a fine audience-hall of the 18th century; and military architecture survive, among them a cylindrical tower of the 15th century near the Porte Notre-Dame, the southern gate of the city, and the Porte Rivotte, a gate of the 16th century, flanked by two round towers. The Roman remains at Besançon are of great archaeological value. Close to the cathedral there is a triumphal arch decorated with bas-reliefs known as the Porte Noire, which is generally considered to have been built in commemoration of the victories of Marcus Aurelius over the Germans in 167. It is in poor preservation and was partly rebuilt in 1820. Remains of a Roman theatre, of an amphitheatre, of an aqueduct which entered the town by the Porte Tallée, a gate cut in the rock below the citadel, and an arch of a former Roman bridge, forming part of the modern bridge, are also to be seen. Besançon has statues of Victor Hugo and of the Marquis de Joffroy d’Abbans (b. 1751), inventor of steam navigation.

Besançon is important as the seat of an archbishopric, a court of appeal and a court of assizes, as centre of an académie (educational division), as seat of a prefect and as headquarters of the VIIth army corps. It also has tribunals of first instance and of commerce, a chamber of commerce, a board of trade-arbitrators, an exchange and a branch of the Bank of France. Its educational establishments include the university with its faculties of science and letters and a preparatory school of medicine and pharmacy, an artillery school, the lycée Victor Hugo for boys, a lycée for girls, an ecclesiastical seminary, training colleges for teachers, and schools of watch-making, art, music and dairy-work. The library contains over 150,000 volumes, and the city has good collections of pictures, antiquities and natural history. The chief industry of Besançon is watch- and clock-making, introduced from the district of Neuchâtel at the end of the 18th century. It employs about 12,000 workpeople, and produces annually 300,000 to 400,000 watches sold in France. Subsidiary industries, such as enamelling, are also important. The metalurgical works of the Société de la Franche-Comté are established in the city and there are saw-mills, printing-works, paperfactories, distilleries, and manufacturers of boots and shoes, machinery, hoseiy, leather, elastic fabric, confectionery and artificial silk. There is trade in agricultural produce, wine, metals, &c. The canal from the Rhone to the Rhine passes under the citadel by way of a tunnel, and the port of Besançon has considerable trade in coal, sand, &c.

As a fortress Besançon forms one of a group which includes Dijon, Langres and Belfort; these are designed to secure Franche Comté and to cover a field army operating on the left flank of a German army of invasion. The citadel occupies the neck of the peninsula upon which the town stands; along the river bank in a semicircle is the town enceinte, and the suburb of Bittant on the right bank of the Doubs is also “regularly” fortified as a bridge-head. These works, and Forts Chaudanne and Brégille.
overlooking the Doubs at the bend, were constructed prior to 1870. The newer works enclose an area more suited to the needs of modern warfare: the chain of detached forts along the ridge of the left bank has a total length of 7½ m., and the centre of this chain is supported by numerous forts and batteries lying between it and the citadel. On the other bank Fort Chaudanne is now the innermost of several forts facing towards the south-west, and the foremost of these works connects the fortifications of the left bank with another chain of detached forts on the right bank. The latter completely encloses a large area of ground in a semicircle of which Besançon itself is the centre, and the whole of the newer works taken together form an irregular ellipse of which the major axis, lying north-east by south-west, is formed by the Dous.

Besançon is a place of great antiquity. Under the name of Vesanctio it was, in the time of Julius Caesar, the chief town of the Sequani, and in 58 B.C. was occupied by that general. It was a rich and prosperous place under the Roman emperors, and Marcus Aurelius promoted it to the rank of a colonia as Colonis Victoris Sequanorum. During the succeeding centuries it was several times destroyed and rebuilt. The archbishopric dates from the close of the 2nd century, and the archbishops gradually acquired considerable temporal power. As the capital of the free county of Burgundy, or Franche-Comté, it was united with the German kingdom when Frederick I. married Beatrix, daughter of Renaud III., count of Upper Burgundy. In 1184 Frederick made it a free imperial city, and about the same time the archbishop obtained the dignity of a prince of the Empire. It afterwards became detached from the German kingdom, and during the 14th century came into the possession of the dukes of Burgundy, from whom it passed to the emperor Maximilian I., and his grandson Charles V. Cardinal Granvella, who was a native of the city, became archbishop in 1584, and founded a university which existed until the French Revolution. After the abdication of Charles V. it came into the possession of Spain, although it remained formally a portion of the Empire until its cession at the peace of Westphalia in 1648. During the 17th century it was attacked several times by the French, to whom it was definitely ceded by the peace of Nijmegen in 1678. It was then fortified by the engineer Vauban. Until 1789 it was the seat of a parlement. In 1814 it was invested and bombarded by the Austrians, and was an important position during the Franco-German War of 1870-71.

See also Autobiography of Sir Walter Besant (1892), with a preface by S. S. Sprigge; the preface to the library edition (1887) of Ready-Money Mortibey contains a history of the literary partnership of Besant and Rice.

BESNVAL DE BRONSTATT, PIERRE VICTOR, BARON DE (1722-1794), French soldier, was born at Soleure. He was the son of Jean Victor Besnval, colonel of the regiment of Swiss guards in the pay of France, who was awarded in 1707 by Louis XIV. with a mission to Sweden, to reconcile Charles XII. with the tsar Peter the Great, and to unite them in alliance with France against England. Pierre Victor served at first as aide-de-camp to Marshal Broglie during the campaign of 1748 in Bohemia, then as aide-de-camp to the duke of Orleans during the Seven Years War. He then became commander of the Swiss Guards. When the Revolution began Besnval remained firmly attached to the court, and he was given command of the troops which the king had concentrated on Paris in July 1789—a movement which led to the taking of the Bastille on the 14th of July. Besnval showed incompetence in the crisis, and attempted to flee. He was arrested, tried by the tribunal of the Châtelet, but acquitted. He then fell into obscurity and died in Paris in 1794. Besnval de Bronstatt is principally known as the author of Mémoires, which were published in 1805-1807 by the vicomte T. A. de Ségur, in which are reported many scandalous tales, true or false, of the court of Louis XVI. and Marie Antoinette. The authenticity of these memoirs is not absolutely established.

BREMEN, JACOB FRIEDRICH VON, BARON (1750-1868), Swedish dramatist and historian, son of a Stockholm merchant, was born on the 16th of April 1796. His vocation for literature was assisted by his tutor, the poet Johan Magnus Stjernstolpe (1777-1831), whose works he edited. He entered the civil service in 1814, was ennobled in 1826 and received the title of baron in 1843. He held high appointments at court, and was, from 1834 onwards, perpetual secretary of the Swedish academy, using his great influence with tact and generosity. His poetry is over-decorated, and his plays are grandiose historical poems in dramatic form. Among them are "Erik XIV." (2 parts, 1826) and four pieces collected (1836-1838) as Dramatiska Studier, the most famous of which is the tragedy of "Thorkel Knutsson." His works include many academic memoirs, volumes of poetry, philosophy and a valuable historical study, and Conditions of Men (1882) produced a stirring story of East End life in London, which set to foot the movement that culminated in the establishment of the People's Palace in the Mile End Road. Though not himself a pioneer in the effort made by Canon Barnett and others to alleviate the social evils of the East End by the personal contact of educated men and women of a superior social class, his books rendered immense service to the movement by popularizing it. His sympathy with the poor was shown in another attempt to stir public opinion, this time against the evils of the sweating system, in The Children of Gibson (1886).

Other popular novels by him were Dorothy Forster (1884), Armorer of Lyonsse (1890), and Beyond the Dreams of Avarice (1895). He also wrote critical and biographical works, including The French Humorists (1873), Rubalais (1879), and lives of Coligny, Whittington, Captain Cook and Richard Jefferies. Besant undertook a series of important historical and archaeological volumes, dealing with the associations and development of the various districts of London—of which the most important was A Survey of London, unfortunately left unfinished, which he intended to do for modern London what Stow did for the Elizabethan city. Other books on London (1892), Westminster (1895) and South London (1899) showed that his mind was full of his subject. No man of his time evinced a keener interest in the professional side of literary work, and the improved conditions of the literary career in England were largely due to his energetic and capable exposition of the commercial value of authorship and to the unselfish efforts which Sir Walter constantly made on behalf of his fellow-workers in the field of letters.

BESNARD, PAUL ALBERT (1840—  ), French painter, was born in Paris and studied at the École des Beaux-Arts, winning the Prix de Rome in 1874. Until about 1880 he followed the academic tradition, but then broke away completely, and devoted himself to the study of colour and light as conceived by the impressionists. The realism of this group never appealed to his bold imagination, but he applied their technical method to ideological and decorative works on a large scale, such as his frescoes at the Sorbonne, the École de Pharmacie, the Salle des Sciences at the hôtel de ville, the mairie of the first arrondissement, and the chapel of Berck hospital, for which he painted twelve "Stations of the Cross" in an entirely modern spirit. A great virtuoso, he achieved brilliant successes alike in water-colour, pastel, and etching, both in portraiture, in landscape and in decoration. A good example of his felicity is his portrait of Madame Réjane; and his close analysis of light can be studied in his picture "Femme qui se chauffe" at the Luxembourg in Paris.

BESOM (Old Eng. besem, a rod), originally a bundle of rods or twigs, used for sweeping, &c.; a stiff broom.

BESSARABIA, a government of south-west Russia, separated on the W. and S. from Moldavia and Walachia by the Pruth, and on the E. and N. from the Russian governments of Podolia and Kherson by the Dniester; on the S.E. it is washed by the Black Sea. Area, 17,614 sq. m. The northern districts are invaded by offshoots of the Carpathians, which reach altitudes of 800 to 1150 ft., and are cut up by numerous ravines and river valleys. Here, however, agriculture is the prevailing occupation, the soil being the fertile black earth. The crops principally raised are wheat and maize, though, as well as in other parts of the government, barley, flax, tobacco, water-melons, gourds, fruit, wine, saffron and madder are grown. The middle of the government is also hilly (850–1000 ft.), and is heavily timbered, chiefly with beech, oak and mountain-ash, and, though to a smaller extent, with birch. The districts south of the Old Roman earthworks which link the Dniester with the Pruth along the line of the Botna, just south of Bender, consist of level pasture-land known as the Budjak steppes. Here stock-breeding is the predominant calling, the people owning large numbers of sheep, cattle and horses, also goats, pigs and buffaloes. Lagoons fringe the lower course of the Pruth and the coast of the Black Sea, and marshy ground exists beside the Reuth and other tributaries of the Dniester. The climate is rather subject to extremes, the mean temperature for the year, at Kishinev, being 50° Fahr., of January 27°, and of July 72°. The rainfall amounts to over 25 in. annually. Salt, saltitre and marble are the principal mineral products. Manufacturing industry is only just beginning, wine-making (17,000,000 gallons annually), cloth-mills, iron-works, soap-works and tanneries being the principal branches. Both the Dniester and the Pruth are important waterways commercially, the former being navigable up to Mogilev and the latter to Levo (46° 36' N. lat.). Down the Dniester come timber and wooden wares from Galicia, and grain and wool from Bessarabia itself. Three branches of the railway from Odessa to Poland penetrate the government and proceed towards the Carpathians. The population numbered 988,431 in 1860 and 1,938,326 in 1879, of whom only 302,852 were urban, while 942,179 were women. In 1906 it was estimated at 2,262,400. It consists of various races, nearly one-half (920,919 in 1897) being Moldavians, the others Little Russians, Jews (37% in the towns and 12% in the rural districts), Bulgarians (103,225), Germans (60,266), with some Gypsies (Zigan), Greeks, Armenians, Tatars and Albanians. The Germans, who form some thirty prosperous colonies in the Budjak steppes west of Akkerman, have been settled there since about 1814. The government is divided into eight districts, the chief towns of which are Akkerman (pop. 32,479 in 1900), Bender (33,741 in 1900), Byeltsi (18,526 in 1897), Izmail (33,607 in 1900), Khotin (18,120), Kishinev (125,787 in 1900), Orgevey (13,359), and Soroki (25,523 in 1900). The capital is Kishinev. Karag, on the Pruth, and Reni on the Danube (the place to which Alexander of Bulgaria was carried when kidnapped by the Russians in 1886), are small, but lively, river-ports.

The original inhabitants were Cimmerians, and after them came Scythians. During the early centuries of the Christian era Bessarabia, being the key to one of the approaches towards the Byzantine empire, was invaded by many successive races. In the 2nd century it was occupied by theGetae, a Thracian tribe, whom the Roman emperor Trajan conquered in 106; he then incorporated the region in the province of Dacia. In the following century the Goths poured into this quarter of the empire, and in the 5th century it was overruled one after the other by the Huns, the Avars and the Bulgarians. Then followed in the 7th century the Bessi, a Thracian tribe, who gave their name to the region, and in the 9th the Ugrics, that is to say the ancestors of the present Magyars of Hungary, the country being called, in their time, Ungaria. The Ugrics were succeeded farther west by the Turkish tribe of the Petchenges in the time of Bagdad, and these were succeeded in the 11th century by the Kumans (Coman) or Polovtsians, a kindred Turkish stock or federation. In the 13th century Bessarabia was overrun by the irresistible Mongols under the leadership of Batu, grandson of Jenghiz Khan. In this century also the Genoese founded trading factories on the banks of the Dniester. In 1367 Bessarabia was subdued and annexed by the ruling prince of Moldavia. During the 16th century it was in the possession alternately of the Turks and the Nagais or Crimean Tatars. From early in the 18th century it was a bone of contention between the Ottoman Turks and the Russians, the latter capturing it five times between 1711 and 1812. In the latter year it was definitely annexed to Russia, and in 1829 its frontier was pushed southwards so as to include the delta of the Danube. After the Crimean War, however, Russia ceded to Moldavia not only this later addition, but also certain districts in the south of the existing government, amounting altogether to an area of 4290 sq. m. and a population of 180,000. By the treaty of Berlin (1878) Russia recovered of this 3380 sq. m., with a population of 127,000.

See Nako, History of Bessarabia, in Russian (1873).

BESSARION, JOHANNES, or BASILIUS (c. 1395-1472), titular patriarch of Constantinople, and one of the illustrious Greek scholars who contributed to the great revival of letters in the 15th century, was born at Trebizond, the year of his birth being variously given as 1389, 1395 or 1403. He was educated at Constantinople, and in 1423 was sent to the Peloponnesse to hear Gemistus Pletho expound the philosophy of Plato. On entering the order of St Basil, he adopted the name of an old Egyptian anchorite Bessarion, whose story he has related. In 1437 he was made archbishop of Nicea by John VII. Palaeologus, whom he accompanied to Italy in order to bring about a union between the Greek and Latin churches with the object of obtaining help from the West against the Turks. The Greeks had bitterly resented his attachment to the party which saw no difficulty in the accommodation of the two churches. At the councils held in Ferrara and Florence Bessarion supported the Roman church, and gained the favour of Pope Eugenius IV., who invested him with the rank of cardinal. From that time he resided permanently in Italy, doing much, by his patronage of learned men, by his collection of books and manuscripts, and by his own writings, to spread abroad the new learning. He held in succession the archbishopric of Siponto and the bishoprics of Sabina and Frascati. In 1463 he received the title of Latin patriarch of Constantinople; and it was only on account of his Greek birth that he was not elevated to the papal chair. For five years (1450-1455) he was legate at Bologna, and he was engaged on embassies to many foreign princes, among others to Louis XI. of France in 1471. Vexation at an insult offered him by Louis is said to have hastened his death, which took place on the 19th
of November 1472, at Ravenna. Bessarion was one of the most learned scholars of his time. Besides his translations of Aristotle's *Metaphysics* and Xenophon's *Memorabilia*, his most important work is a treatise directed against George of Trebizond, a violent Aristotelian, entitled *In Columniatorum Platonis* Bessarion, though a Platonist, is not so thoroughgoing in his admiration as Gemistus Pletio, and rather strives after a reconciliation of the two philosophies. His work, by opening up the relations of Platonism to modern questions of religion, contributed greatly to the extension of speculative thought in the department of theology. His library, which contained a very extensive collection of Greek MSS., was presented by him to the senate of Venice, and formed the nucleus of the famous library of St Mark.

Voigt, *Die Wiederbelebung des klassischen Alterthums* (1843); on Bessarion at the councils of Ferrara and Florence, A. Sadov, *Bessarion de Nicée* (1883); on his philosophy, monograph by A. Kandelos (in Greek: Athens, 1888); most of his works are in Migne, *Patrologia Graeca*, cix.

**BESSBOROUGH, EARLS OF.** The Ponsonby family, who have contributed many conspicuous men to Irish and English public life, trace their descent to Sir John Ponsonby (d. 1678), of Cumberland, a Commonwealth soldier who obtained lands in Ireland. His son William (1657-1724) was created Baron Bessborough (1721) and Viscount Duncannon (1723), and the latter's son Brabazon was raised to the earldom of Bessborough in 1739. He was the father not only of the 2nd earl (1704-1793), but of John Ponsonby (q.v.), speaker of the Irish House of Commons. The 2nd earl was a well-known Whig politician, who held various offices of state; and his son the 3rd earl (1758-1844) was father of the 4th earl (1817-1847), first commissioner of works in 1831-1834, lord privy seal from 1835 to 1839 and lord-lieutenant of Ireland in 1846. He was succeeded by his three sons, the 5th earl (d. 1880), 6th earl (1815-1895), a famous cricketer and chairman of the Bessborough commission (1881) to inquire into the Irish land system, and 7th earl (d.1900), and the last named by his son the 8th earl.

**BESSÈGES, a town of south-eastern France, in the department of Gard, on the Cèze, 20 m. north of Alès by rail. Pop. (1906) 7602. The town is important for its coal-mines, blast-furnaces and iron smelting.**

**BESSLER, FRIEDRICH WILHELM (1784-1846), German astronomer, was born at Minden on the 22nd of July 1784. Placed at the age of fifteen in a counting-house at Bremen, he was imported by his desire to obtain a supercargo on a foreign voyage to study navigation, mathematics and finally astronomy. In 1804 he calculated the orbit of Halley's comet from observations made in 1607 by Thomas Harriot, and communicated his results to H. W. M. Olbers, who procured their publication (Monatliche Correspondenz, x. 423), and recommended the young aspirant in 1805 for the post of assistant in J. H. Schröter's observatory at Lüneburg. A masterly investigation of the comet of 1807 (Königsberg, 1810) enhanced his reputation, and the king of Prussia summoned him, in 1810, to superintend the erection of a new observatory at Königsberg, of which he acted as director from its completion in 1813 until his death. In this capacity he inaugurated the modern era of practical astronomy. For the purpose of improving knowledge of star-places he reduced James Bradley's Greenwich observations, and derived from them an invaluable catalogue of 32,828 stars, published to the value of rights named *Fundamenta Astronomica* (1818). In *Tabulae Regiomontanae* (1830), he definitively established the uniform system of reduction still in use. During the years 1821-1833, he observed all stars to the ninth magnitude in zones extending from $-15^\circ$ to $+45^\circ$ dec., and thus raised the number of those accurately determined to about 50,000. He corrected the length of the seconds' pendulum in 1826, in a discussion re-published by H. Bruns in 1839; measured an arc of the meridian in East Prussia in 1831-1832; and deduced for the earth in 1841 an ellipticity of $\frac{1}{268}$. His ascertainment in 1838 (Astr. Nach., Nos. 356-366) of a parallax of $0^\circ-31$ for 61 Cygni was the first authentic result of the kind published. He announced in 1839 the binary character of Sirius and Procyon from their disturbed proper motions; and was preparing to attack the problem solved later by the discovery of Neptune, when fatal illness intervened. He died at Königsberg on the 17th of March 1846. Modern astronomy of precision is essentially Bessel's creation. Apart from the large scope of his activity, he introduced such important novelties as the effective use of the heliometer, the correction for personal equation (in 1832), and the systematic investigation of instrumental errors. He issued 21 volumes of *Astronomische Beobachtungen auf der Sternwarte zu Königsberg* (1815-1844), and a list of his writings drawn up by A. L. Busch appeared in vol. 24 of the same series. Special attention should be directed to his *Astromonische Untersuchungen* (2 vols. 1841-1842), *Popularle Vorlesungen* (1848), edited by H. C. Schumacher, and to the important collection entitled *Abhandlungen* (4 vols. 1875-1882), issued by R. Engelmann at Leipzig. His minor treatises numbered over 350. In pure mathematics he enlarged the resources of analysis by the invention of Bessel's Functions. He made some preliminary use of these expressions in 1811, in a paper on Kepler's Problem (Transactions Berlin Academy, 1816-1817, p. 49), and fully developed them seven years later, for the purposes of a research into planetary perturbations (ibid. 1824, pp. 1-52).

**Bessel Function**, a certain mathematical relation between two variables. The *Bessel function of order m* satisfies the differential equation

$$\frac{d^2u}{dx^2} + \frac{1}{x} \frac{du}{dx} + \left(1 - \frac{m^2}{x^2}\right) u = 0,$$

and may be expressed as the series

$$u = \sum_{n=0}^{\infty} \frac{a_n}{x^n},$$

the function of zero order is deduced by making $m = 0$, and is equivalent to the series $1 - \frac{3}{2}\frac{a}{x^2} + \frac{15}{8}\frac{a^3}{x^4} + \ldots$; the symbol generally adopted to represent these functions is $J_m(x)$, where $m$ denotes the order of the function. These functions are named after Friedrich Wilhelm Bessel, who in 1817 introduced them in an investigation on Kepler's Problem. He discussed their properties and constructed tables for their evaluation. Although Bessel was the first to systematically treat of these functions, it is to be noted that in 1732 Daniel Bernoulli obtained the function of zero order as a solution to the problem of the oscillations of a chain suspended at one end. This problem has been fully discussed by Sir A. G. Greenhill. In 1764 Leonard Euler employed the functions of both zero and integral orders in an analysis into the vibrations of a stretched membrane; an investigation which has been considerably developed by Lord Rayleigh, who has also shown (1878) that Bessel's functions are particular cases of Laplace's functions. There is hardly a branch of mathematical physics which is independent of these functions. Of the many applications we may notice: Joseph Fourier's (1822) investigation of the motion of heat in a solid cylinder, a problem which, with the related one of the flow of electricity, has been developed by W. E. Weber, G. F. Riemann and S. D. Poisson; the flow of electromagnetic waves along wires (Sir J. Thomson, H. Hertz, O. Heaviside); the defraction of light (E. Lommel, Lord Rayleigh, Georg Wilhelm Stuve); the theory of elasticity (A. E. Love, H. Lamb, C. Chree, Lord Rayleigh); and to hydrodynamics (Lord Kelvin, Sir G. Stokes).

The remarkable connexion between Bessel's functions and spherical harmonics was established in 1868 by F. G. Mehler, who proved that a simple relation existed between the function of zero order and the zonal harmonic of order $n$. Heinrich Eduard Heine has shown that the functions of higher orders may be considered as limiting values of the associated functions;
this relation was discussed independently, in 1878, by Lord Rayleigh.

For the mathematical investigation see *Spherical Harmonics* and for tables see *Table, Mathematical*.

**BESSEMER, Sir Henry** (1813–1898), English engineer, was born on the 19th of January 1813, at Charlton, in Hertfordshire. Throughout his life he was a prolific inventor, but his name is chiefly known in connexion with the Bessemer process for the manufacture of steel, by which it has been rendered famous throughout the civilized world. Though this process is now largely supplemented, and even displaced, by various rivals, at the time it was brought out it was of enormous industrial importance, since it effected a great cheapening in the price of steel, and led to that material being widely substituted for others which were inferior in almost every respect but that of cost. Bessemer’s attention was directed to the problem of steel manufacture in the course of an attempt to improve the construction of guns. Coming to the conclusion that if any advance was to be made in artillery better metal must be available, he established a small ironworks in St Pancras, and began a series of experiments. These he carried on for two years before he evolved the essential idea of his process, which is the decarboxylation of cast iron by forcing a blast of air through the mass of metal when in the molten condition. The first public announcement of this process was made at the Cheltenham meeting of the British Association in 1856, and immediately attracted considerable notice. Many metallurgists were sceptical on theoretical grounds about his results, and only became convinced when they saw that his process was really able to convert melted cast iron into malleable iron in a perfectly fluid state.

But though five firms applied without delay for licences to work under his patents, success did not at once attend his efforts; indeed, after several ironmasters had put the process to practical trial and failed to get good results, it was in danger of being thrust aside and entirely forgotten. Its author, however, instead of being discouraged by this lack of success, continued his experiments, and in two years was able to turn out a product, the quality of which was not inferior to that yielded by the older methods. But when he now tried to induce makers to take up his improved system, he met with general reproofs, and finally was driven to undertake the exploitation of the process himself. To this end he erected steelworks in Sheffield, on ground purchased with the help of friends, and began to manufacture steel. At first the output was insignificant, but gradually the magnitude of the operations was enlarged until the competition became effective. The purer iron obtained from Cumeiberg manganese, and even with this, he did not meet with much success, until Robert Mushet showed that the addition of a certain quantity of spiegelisen had the effect of removing the difficulties.

Whether or not Mushet’s patents could have been sustained, the value of his procedure was shown by its general adoption in conjunction with the Bessemer method of conversion. At the same time it is only fair to say that whatever may have been the conveniences of Mushet’s plan, it was not absolutely essential; this Bessemer proved in 1865, by exhibiting a series of samples of steel made by his own process alone. The pecuniary rewards of Bessemer’s great invention came to lie with comparative quickness; but it was not till 1879 that the Royal Society admitted him as a fellow and the government honoured him with a knighthood. Bessemer died at Denmark Hill, London, on the 15th of March 1898.

Among Bessemer’s numerous other inventions, not one of which attained a tithe of the success or importance of the steel process, were moveable dies for embossed stamps, a gold paint, sugar machinery, and a ship which was to save her passengers from the miseries of *mal de mer*. This last had her saloon mounted in such a way as to be free to swing relatively to the boat herself, and the idea was that this saloon should always be maintained steady and level, no matter how rough the sea. For this purpose hydraulic mechanism of Bessemer’s design was arranged under the control of an attendant, whose duty it was to keep watch on a spirit-level, and counteract by proper manipulation of the apparatus any deviation from the horizontal that might manifest itself on the floor of the saloon owing to the rolling of the vessel. A boat, called the “Bessemer,” was built on this plan in 1875 and put on the cross-Channel service to Calais, but the mechanism of the swinging saloon was not found to be effective in practice and was ultimately removed.

An *Autobiography* was published in 1905.

**BESSEMER, a town of Jefferson county, Alabama, U.S.A.,** about 12 m. S.W. of Birmingham, a little N. of the centre of the state. Pop. (1890) 4,544; (1900) 6,538, including 3,695 negroes; (1910) 10,864. The town is served by the Alabama Great Southern (Queen & Crescent route), the Louisville & Nashville, the Kansas City, Memphis & Birmingham (St Louis & San Francisco system), the Birmingham Southern, and the Atlantic, Birmingham & Atlantic railways. Bessemer is situated in the midst of the iron ore and limestone district of Alabama, in the south part of Jones’ Valley (about 3 m. wide); to the east is the Red Ore mountain range, rich in red haematite; to the north-west are the Warrior coalfields; to the south-west, south and south-east are immense fossiliferous iron ore seams and the Cahaba coalfields; in the immediate vicinity of the city are limestone quarries, and about 18 m. north-east are the limestone kilns of Gate City. Mining, iron smelting and the manufacture of iron and coke are the chief industries of Bessemer; truck farming is also an important industry. In 1900 Bessemer was the eighth city of the state in population, second in amount of capital invested in manufacturing, and fourth in value of its manufactured product for the year. Bessemer was laid out in 1887, and was incorporated in 1889.

**BESSIÈRES, Jean Baptiste,** duke of Istria (1768–1813), French marshal, was born near Cahors in 1768. He served for a short time in the “Constitutional Guard” of Louis XVI. and as a non-commissioned officer took part in the war against Spain. In the Army of the Eastern Pyrenees and in the Army of the Moselle he repeatedly distinguished himself for valor, and in 1796, as captain, he served in Bonaparte’s Italian campaign. At Rovredo his conduct brought him to his chief’s notice, and after Rivioli he was sent to France to deliver the captured colours to the Directory. Hastening back to the front, he accompanied Napoleon in the invasion of Styria in command of the “Guilde,” who formed the nucleus of the later Consular and Imperial Guard. As chef de brigade he next served in the Egyptian expedition, and won further distinction at Acre and Aboikur. Returning to Europe with Napoleon, he was present at Marengo (1800) as second-in-command of the Consular Guard, and led a brilliant and successful cavalry charge at the close of the day, though its effect on the battle was not as decisive as Napoleon pretended. Promoted general of division in 1802 and marshal of France in 1804, he made the most famous
campaigns of the Grande Armée as colonel-general of the Guard Cavalry (1805, 1806, 1807). In 1809 he had received the Grand Eagle of the Legion of Honour, and in 1809 was created duke of Istria. With the outbreak of the Peninsular War, Marshal Bessières had his first opportunity of an independent command, and his crushing victory over the Spaniards at Medina del Río Seco (1808) justified Napoleon's choice. When disaster in other parts of the theatre of war called Napoleon himself to the Peninsula, Bessières continued to give the emperor the very greatest assistance in his campaign. In 1809 he was again with the Grande Armée in the Danube valley. At Essling his repeated and desperate charges checked the Austrians in the full tide of their success. At Wagram he had a horse killed under him. Replacing Bernadotte in the command of the Army of the North, a little later in the same year, the newly-created duke of Istria successfully opposed the British Walcheren expedition, and in 1811 he was back again, in a still more important command, in Spain. As Masséna's second-in-command he was present at the battle of Fuentes de Oñoro, but Napoleon never detached him for very long, and in 1812 he commanded the Guard Cavalry at Bayonne. When Napoleon in 1813 won further distinction, and at the beginning of the 1813 campaign he was appointed to the command of the whole of Napoleon's cavalry. Three days after the opening of the campaign, while reconnoitring the defile of Poserma-Rippach, Napoleon was killed by a musket-ball. Napoleon, who deeply felt the loss of one of his truest friends and ablest commanders, protected his children, and his eldest son was made a member of the Chamber of Peers by Louis XVIII. As a commander, especially of cavalry, Bessières left a reputation excelled by very few of Napoleon's marshals, and his dauntless courage and cool judgment made him a safe leader in independent command. He was personally beloved to an extraordinary extent amongst his soldiers, and (unlike most of the French generals of the time) amongst his opponents. It is said that masses were performed for his soul by the priests of insurgent Spain, and the king of Saxony raised a monument to his memory.

His younger brother, Bertrand, Baron Bessières (1775–1855), was a distinguished engineer, who served in Napoleon's Army. After serving with a good record in Italy, in Egypt and at Hohenlinden, he had a command in the Grande Armée, and in 1808 was sent to Spain. He commanded a division in Catalonia and played a notable part at the action of Molinis de Rey near Barcelona. Disagreements with his superior, General Dulemes, led to his resignation, but he subsequently served with Napoleon in all the later campaigns of the empire. Placed on the retired list by the Bourbons, his last public act was his defence of the unfortunate Ney. The rest of his long life was spent in retirement.

BESSUS, satrap of Bactria and Sagidiana under Darius III. In the battle of Gaugamela (1st of October 331) he commanded the troops of his satrapy. When Alexander pursued the Persian king on his flight to the East (summer 330), Bessus with some of the other conspirators deposed Darius and shortly afterwards killed him. He then tried to organize a national resistance against the Macedonian conqueror in the eastern provinces, proclaimed himself king and adopted the name Artaxerxes. But he was taken prisoner by the Persians, and Alexander sent him to Ecbatana, where he was condemned to death. Before his execution his nose and ears were cut off, according to the Persian custom; we learn from the Behistun inscription that Darius I. punished the usurpers in the same way.

BEST, WILLIAM THOMAS (1826–1897), English organist, the son of a solicitor, was born at Carlisle on the 13th of August 1826. Having decided upon a musical career, he received his first instruction from the cathedral organist. He applied himself especially to Bach's music, and became a player of great skill. His successive appointments were to Pembroke chapel, Liverpool, 1840; to a church for the blind, 1847, and the Liverpool Philharmonic Society, 1848. For a short time (1854–1855) he was in London at the Panopticon in Leicester Square, the church of St Martin-in-the-Fields, and Lincoln's Inn chapel. In 1855 he returned to Liverpool as organist of St George's, where his performances rapidly became famous throughout England. Ill-health compelled him at last to retire in 1894. He was engaged as solo organist at all the Handel festivals at the Crystal Palace, and also as organist at the Albert Hall, where he inaugurated the great organ in 1871. He had been in the receipt of a civil list pension of £100 a year since 1880, and in 1890 went to Australia to give organ recitals in the town hall of Sydney. Best died at Liverpool on the 10th of May 1897.

His command over all the resources of his own instrument was masterly; his series of Saturday recitals at St George's Hall, carried on for many years, included the whole field of organ music, and of music that could be arranged for the organ, ancient and modern; and his performances of Bach's organ works were particularly fine. His own compositions for the organ, chiefly comprised in the publication entitled Organ Pieces for Church Use, have a strong and marked individuality. Best, unlike many soloists, was an all-round musician, and fully acquainted with every branch of the art. His bust, by Conrad Dressler, has been placed on the platform in front of the Liverpool organ, and in a list of his long series of performances there.

BESTIA, the name of a family in ancient Rome, of which the following were the most distinguished.

1. LUCIUS CALPURNIUS BESTIA, Roman tribune of the people in 121 B.C., consul in 111. Having been appointed to the command of the operations against Jugurtha, he at first carried on the campaign energetically, but soon, having been heavily bribed, concluded a disgraceful peace. On his return to Rome he was brought to trial for his conduct and condemned, in spite of the efforts of Marcus Scaurus who, though formerly his legate and equally guilty, was one of the judges. He is probably identical with the Bestia who encouraged the Italians in their revolt, and went into exile (96) to avoid punishment under the law of Q. Varus, whereby those who had secretly or openly aided the Italian allies against Rome were to be brought to trial (Appian, Bell. Civ. i. 37; Val. Max. viii. 6. 4). Both Cicero and Sallust express a high opinion of Bestia's abilities, but his love of money demoralized him. He is mentioned in a Carthaginian inscription as one of a board of three, perhaps an agricultural commission.

See Sallust, Jugurtha; Cicero, Brutus, xxxiv. 128; for the general history, A. H. J. Greenidge, Hist. of Rome, vol. i. (1904), pp. 346 foll.

2. LUCIUS CALPURNIUS BESTIA, one of the Catilinarian conspirators, possibly a grandson of the above. He was tribune elect in 63, and it had been arranged that, after entering upon his office, he should publicly accuse Cicero of responsibility for the impending war. This was to be the signal for the outbreak of revolution. The conspiracy, however, was put down and Bestia had to content himself with delivering a violent attack upon the consul on the expiration of his office. This Bestia is probably not the Lucius Calpurnius Bestia, aedile, and a candidate for the praetorship in 57. He was accused of bribery during his candidacy, and, in spite of Cicero's defence, was condemned. In 43 he attacked himself to the party of Antony, apparently in the hope of obtaining the consulship.

Sallust, Catilina, xvii. 43; Appian, Bell. Civ. ii. 3; Cicero, Ad Q. Fr. ii. 3, 6.

BESTUZHEV-RYUMIN, ALEXIUS PETROVICH, COUNT (1663–1768), grand chancellor of Russia, the second son of Count Peter Bestuzhev, the early favourite of the empress Anne, was born at Moscow on the 1st of June 1693. Educated abroad, with his elder brother Mikhail, at Copenhagen and Berlin, he especially distinguished himself in languages and the applied sciences. Peter the Great, in 1712, attached him to Prince Kurakin at the Utrecht Congress that he might learn diplomacy, and for the same reason permitted him in 1713 to enter the service of the elector of Hanover. George I. took him to London in 1714, and sent him to St Petersburgh as his accredited minister with a notification of his accession. Bestuzhev then returned to England, where he remained four years. It was the necessary apprenticeship to his brilliant diplomatic career. His passion for intrigue is curiously illustrated by his letter to the tsarovich...
Alexius at Vienna, assuring his “future sovereign” of his devotion, and representing his sojourn in England as a deliberate seclusion of a zealous but powerless well-wisher. This extraordinary indiscretion might well have cost him the tsar's or the tsarina's good graces, but he fortunately destroyed the letter. On his return to Russia he served for two years without any salary as chief gentleman of the Bedchamber at the court of Anne of Courland, and in 1721 succeeded Vasily Dolgoruki as Russian minister at Copenhagen. Copenhagen was then a whirlpool of diplomatic intrigue, for George I. was endeavouring to arm the northern powers against Peter the Great, and this it was Bestuzhev's mission to counteract. On the occasion of the peace of Nystad, which terminated the 21 years' war between Russia and Sweden, Bestuzhev designed and struck a commemorative medal with a panegyrical Latin inscription, which so delighted Peter (then at Derbent) that he sent a letter of thanks written with his own hand and his portrait set in brilliants. It was at this time too that the many-sided Alexius invented his famous “drops,” or tinctura tonicovervina Bestuscheffi, the recipe of which was stolen by the French brigadier Lamotte, who made his fortune by introducing it at the French court, where it was known as Elixir d'Or.

The sudden death of Peter the Great seriously injured Bestuzhev's prospects. For more than ten years he remained at Copenhagen, looking vainly towards Russia as a sort of promised land from which he was excluded by enemies or rivals. He rendered some services,however, to the cause of the cause of Russia, upon which he was decorated and made a privy councillor. He also won the favour of Biren, and on the tragic fall of Artemy Volinsky in 1739 was summoned home to take his place in the council. He assisted Biren to obtain the regency in the last days of the empress Anne, but when his patron fell three weeks later, his own position became extremely precarious. His chance came when the empress Elizabeth, immediately after her accession, summoned him back to court, and appointed him vice-chancellor. For the next twenty years, during a period of exceptional difficulty, he practically controlled the foreign policy of Russia. Bestuzhev rightly recognized that, at this time, France was the natural enemy of Russia. The interests of the two states in Turkey, Poland and Sweden were diametrically opposed, and Russia could never hope to be safe from the intrigues of France in these three borderlands. All the enemies of France were thus necessarily the friends of Russia, and her friends Russia's enemies. Consequently Great Britain, and still more Austria, were Russia's natural allies, while the aggressive and energetic king of Prussia was a danger to be guarded against. It was, therefore, the policy of Bestuzhev to bring about a quadruple alliance between Russia, Austria, Great Britain and Saxony, to counterpoise the Franco-Prussian league. But he was on dangerous ground. The empress herself was aversive from an alliance with Great Britain and Austria, whose representatives had striven to prevent her accession; and many of her personal friends, in the pay of France and Prussia, took part in innumerable conspiracies to overthrow Bestuzhev. Nevertheless, step by step, Bestuzhev, aided by his elder brother Mikhail, carried out his policy. On the 11th of December 1742, a defensive alliance was concluded between Great Britain and Russia. Bestuzhev had previously rejected with scorn the proposals of the French government to mediate between Russia and Sweden on the basis of a territorial surrender on the part of the former; and he conducted the war so vigorously that by the end of 1742 Sweden lay at the mercy of the empress. At the peace congress of Åbo (January–August 1743) he insisted that the whole of Finland should be ceded to Russia, by way of completing the testament of Peter the Great. But the French party contrived to get better terms for Sweden, by artfully appealing to the empress's fondness for the house of Holstein. The Swedes, at the desire of Elizabeth, accepted Adolphus Frederick, duke of Holstein, as their future king, and, in return, received back Finland, with the exception of a small strip of land up to the river Kymmene. Nor could

1 A copy of the letter was taken by way of precaution, beforehand, by the Austrian ministers, and this copy is still in the Vienna archives.

Bestuzhev prevented the signing of a Russo-Prussian defensive alliance (March 1743); but he deprived it of all political significance by excluding from it the proposed guarantee of Frederick's Silesian conquests. Moreover, through Bestuzhev's efforts, the emperor of Russia (whom he rightly regarded as more dangerous than France) as the Russian court fell steadily, and the vice-chancellor prepared the way for an alliance with Austria by acceding to the treaty of Breslau (1st of November 1743). A bogus conspiracy, however, got up by the Holstein faction, aided by France and Prussia, who persuaded Elizabeth that the Austrian ambassador was intriguing to replace Ivan VI. on the throne, alienated the empress from Austria for a time; and Bestuzhev's ruin was regarded as certain when, in 1743, the French agent, the marquis de La Chétardie, arrived to reinforce his other enemies. But he found a friend in need in M. L. Vorontsov, the empress's confidant, who shared his political views. *Still his position was most delicate, especially when the betrothal between the grand-duke Peter and Sophia of Anhalt-Zerbst (afterwards Catharine II.) was carried through against his will, and Elizabeth of Holstein, the mother of the bride, arrived in the Prussian interests to spy upon him. Frederick II., conscious of the instability of his French ally, was now eager to contract an offensive alliance with Russia; and the first step to its realization was the overthrow of Bestuzhev, "upon whom," he wrote to his minister Axel von Mardefeld, "the fate of Prussia and my own house depends." But Bestuzhev succeeded, at last, in convincing the empress that Vorontsov was an impudent intriguer, and on the 6th of June 1744 that diplomatist was ordered to quit Russia within twenty-four hours. Five weeks later Bestuzhev was made grand chancellor (July 15th). Before the end of the year Elizabeth of Holstein was also expelled from Russia, and Bestuzhev was supreme.

The attention of European diplomacy at this time was concentrated upon the king of Prussia, whose insatiable acquisitiveness disturbed all his neighbours. Bestuzhev's offer, communicated to the British government at the end of 1745, to attack Prussia if Great Britain would guarantee subsidies to the amount of some £6,000,000, was rejected as useless now that Austria and Prussia were coming to terms. Then he turned to Austria, and on the 22nd of May 1746, an offensive and defensive alliance was concluded between the two powers manifestly directed against Prussia. In 1747, alliances were also concluded with Denmark and the Porte. At the same time Bestuzhev resisted any rapprochement with France, and severely rebuked the court of Saxony for its intrigues with that of Versailles. About this time he was hampered by the persistent opposition of the vice-chancellor Mikhail Vorontsov, formerly his friend, now his jealous rival, who was secretly supported by Frederick the Great. In 1748, however, he got rid of him by inducing the empress that Vorontsov was in the pay of Prussia. The hour of Bestuzhev's triumph coincided with the peace congress of Aix-la-Chapelle, which altered the whole situation of European politics and introduced fresh combinations, the breaking away of Prussia from France and a rapprochement between England and Prussia, with the inevitable corollary of an alliance between France and the enemies of Prussia. Bestuzhev's violent political prejudices at first prevented him from properly recognizing this change. Passion had always been too large an ingredient in his diplomacy. His Anglomania also misled him. His enemies, headed by his elder brother Mikhail and the vice-chancellor Vorontsov, powerless while his diplomacy was faultless, quickly took advantage of his mistakes. When, on the 16th of January 1756, the Anglo-Prussian alliance were concluded, Vorontsov advocated the accession of Russia to the latter league, whereas Bestuzhev insisted on a subsidy treaty with Great Britain. But his influence was now on the wane. The totally unexpected Anglo-Prussian alliance had justified the arguments of his enemies that England was impossible, while his hatred of France prevented him from adopting the only alternative of an alliance with her. To prevent underground intrigues, Bestuzhev now proposed the election of a council of ministers, to settle all important
affairs, and at its first session (14th–30th of March) an alliance with Austria, France and Poland against Frederick II. was proposed, though Bestuzhev opposed any composition with France. He endeavoured to support its falling credit by a secret alliance with the Hanoverian prince, and he was proposed to raise to the throne instead of her Holstein husband, Peter, from whom Bestuzhev expected nothing good either for himself or for Russia. The negotiations were conducted through the Pole Stanislaus Poniatowski. The accession of Russia to the anti-Prussian coalition (1756) was made over his head, and the cowardice and incapacity of Bestuzhev’s friend, the Russian commander-in-chief, Stephen Apraksin, after the battle of Gross-Jagersdorf (1757), was made the pretext for overthrowing the chancellor. His unwillingness to agree to the coalition was magnified into a determination to defeat it, though it is quite obvious that he could only gain by the humiliation of Frederick, and nothing was ever proved against him. Nevertheless he was deprived of the chancellorship and banished to his estate at Goretovo (April 1759), where he remained till the accession of Catharine II., who recalled him to court and created him a field marshal. But he took no leading part in affairs and died on the 21st of April 1768, the last of his race.

See Stockton’s Historical Society, vols. 1, 2, 3, 5, 7, 12, 22, 26, 66, 79, 80, 81, 85–96, 91–92, 96, 99, 100, 103; (St Petersburg, 1870, &c.); Politische Correspondens Friederich des Grossen, vols. 1–21 (Berlin, 1879–1904); R. Nisbet Bain, The Daughter of Peter the Great (London, 1896) (2nd ed.) (R. N. B.)

Bestuzhev-Ryumin, Mikhail Petrovich (1688–1750), Russian diplomat, eldest brother of the foregoing, was educated at Berlin, and was sent by Peter the Great to represent Russia at Copenhagen in 1705. In 1720 he was appointed resident at London at a time when the English court was greatly inflamed against Peter, who was regarded as a dangerous rival in the Baltic; and Bestuzhev was summarily dismissed for protesting against the lately-formed Anglo-Swedish alliance. On the conclusion of the peace of Nystad in 1721 he was sent as ambassador to the court of Stockholm. His first official act was the signing of a defensive alliance between Russia and Sweden for twelve years, in 1724. He was successively transferred to Warsaw (1726) and to Berlin (1730), but returned to Stockholm in 1732. How far Bestuzhev was concerned in the murder (June 28th, 1739) of the Swedish diplomatic agent Sinclair in Silesia on his journey home from Constantinople, it is difficult to say. It is certain that Bestuzhev sent information to his court of Sinclair’s mission, which was supposed to be hostile to Russia, and even supplied the portrait of the envoy for recognition. The Swedish authorities are unanimous in describing Bestuzhev as the arch-plotter in this miserable affair; yet, while the active agents were banished to Siberia, Bestuzhev was not even censured. The Sinclair murder led ultimately to the Swedish-Russian War of 1741, when Bestuzhev was transferred first to Hamburg and subsequently to Hanover, where he endeavoured to conclude an alliance between Great Britain and Russia. On his return to Russia in 1743, he was made grand marshal, and married Anna, the widow of Paul Yusuphny, Peter the Great’s famous pupil. A few months later his wife was implicated in a bogus conspiracy got up by the French ambassador, the marquis de La Chétardie, to ruin the Bestuzhevs (see Bestuzhev-Ryumin, Alexius), and after a public whipping, had her tongue cut out and was banished to Siberia. Thither Bestuzhev had not the manhood to follow her, but went abroad, and subsequently resumed his diplomatic career. His last and most brilliant mission was to Versailles, shortly after the conclusion of the coalition against Frederick the Great, where he cut a great figure. He died at Paris on the 26th of February 1765.

**BET and BETTING** (probably from O. Fr. abeter, to instigate, Eng. “abet,” i.e. with money). To “bet” is to stake money or something valuable on some future contingency. Betting in some form or other has been in vogue from the earliest days, commencing in the East with royal and noble gamblers, and gradually extending itself westwards and throughout all classes. In all countries where the English tongue is spoken betting is now largely indulged in; and in the United Kingdom it spread to such a extent that gambling was made illegal by the Gaming Act of 1753. During the 18th century, that the interference of the legislature was necessary (see **GAMING and WAGERING**). Bets can, of course, be made on any subject, and are a common method of backing one’s opinion or skill, whether at games of cards or in any other connexion; but the commonest form of betting is associated with the turf. In the early days of horse-racing persons who wished to bet often failed to gratify their inclination because of the difficulty of finding any one ready to wager. To obviate this difficulty the professional bookmaker arose. It was perceived that if a man laid money against a number of horses, conducting his business on discreet principles, he would in all probability receive enough to pay the bettor who was successful and to leave a surplus for himself; for the “bookmaker,” as the professional betting man came to be called, had enormous advantages in his favour. He was presumably shrewd and wary, whereas many of those with whom he dealt were precisely the opposite, and benefit arose to him from the mistakes and miscalculations of owners and trainers of horses, and from the innumerable accidents which occur to prevent anticipated success; moreover, if he carried out the theory of his calling he would so arrange his book, by what is called “off the figures,” that the money he received would be more than he could possibly be called upon to pay. In practice, of course, this often does not happen, because “backers” will sometimes support two or three horses in a race only, and the success of one may result in loss to the bookmaker; but in the long run it has been almost invariably found that the bookmaker grows rich and that the backer of horses loses money. It is the bookmaker who regulates the odds, and this he does, sometimes by anticipating, sometimes by noting, the desire of backers to support certain animals. Such things as stable secrets can scarcely be said to exist at the present time; the bookmaker is usually as well able as any one else to estimate the chances of the various horses engaged in races. Notwithstanding that the reports of a trial gallop are of comparatively little value to any except the few persons who know what weights the animals carried when tried, the bookmaker is extraordinarily keen, and frequently successful, in his search for information; and on this the odds depend.

**Betting** in connexion with horse-racing is of two kinds: “post,” when wagering does not begin until the numbers of the runners are hoisted on the board; and ante-post, when wagering is made many months in advance of the race. In both cases there is far less than formerly the case, doubtless for the reason that before the introduction of so many new and valuable stakes attention was generally concentrated on a comparatively small number of races. Bets on the Derby, the Oaks and the St Leger were formerly common nearly a year before the running of the race, and a few handicaps, such as the Chester Cup, used to occupy attention months beforehand; the weights, of course, being published at a much longer interval prior to the contest than is at present the rule. As regards ante-post betting, bookmakers have their own ideas as to the relative prospects of the horses entered. A person who wishes to back a horse asks the price, and accepts or declines, as the case may be. If the bet is laid it will probably be quoted in the newspapers, and other persons who propose to wager on the race are so likely to follow suit that it is shrewdly suspected that in not a few cases bets are quoted which never have been laid, in order to induce the backers to speculate. According to the public demand for a horse the price shortens. If there is little or no demand the odds increase, the market being almost entirely regulated by the money; so that if a great many people bet on a certain animal the odds become shorter and shorter, till in many cases instead of laying odds against a horse, the bookmaker comes to take odds, that is, to agree to pay a smaller sum than he would receive from the backer if the animal lost. Post betting is conducted on very much the same principles. When the numbers are...
hoisted bookmakers proclaim their readiness to lay or take certain odds, which vary according to the demand for the different animals. Backers are influenced by many considerations: by gossip, by the opinions of writers on racing, and in many cases, unfortunately, by the advice of "tipsters," who by advertisements and circulars profess their ability to indicate winners, a pretense which is obviously absurd, as if these men possessed the knowledge they claim, they would assuredly keep it to themselves and utilize it for their own private purposes.

The specious promises of such men do infinite mischief, as they so often appeal with success to the folly and gullibility of the ignorant, and in recent years the extent to which betting has grown has resulted in attempts to check it by organized means. A society for the purpose was formed in England called the Anti-Gambling League. A bookmaker named Dunn was summoned in 1897 for betting in Tattersall's enclosure, which it was contended contravened the Betting House Act of 1853. This act had been aimed against what were known as "list houses," establishments then kept by bookmakers for betting purposes, and associated with many disgraceful scandals. In the preamble to his bill Lord Cockburn began by remarking that "Whereas a new form of betting has of late sprung up," and Alexander Tollemache, Lord Auckland, seconded: "The form of betting which had not sprung up of late but had on the contrary been carried on without interference for many generations."

The divisional court of the queen's bench (Howe v. Dunn, 13 T.L.R. 281) held that such betting was an infringement of the act, and that the enclosure was a "place" within the meaning of the act, and had been used by the respondent for the purpose of betting with persons resorting thereto, and that he was liable to be convicted. The case was remitted to the justices, who convicted the defendant. A somewhat similar case was decided on the same day (M'Inany v. Hildreth, 1897, 13 T.L.R. 285), in which it was held that a professional bookmaker who went to a place known as the "pit heap" at Jarrow, to which the public had access at all times, and made bets with persons assembled there, was properly convicted, and that the "pit heap" itself and the place where he stood were "places" within the meaning of the act. It was afterwards held by the court of appeal (Fovell v. Kempton Park Racecourse Co., Ltd., 1897, 2 Q.B. 242), in an action brought to restrain a racecourse company from continuing to keep an enclosure on a racecourse by allowing it to be used by bookmakers, that the words "other place" must be construed as meaning a defined place, that the user of such a place implied some exclusive right in the user against others, and that the racecourse owners had not been guilty of permitting the enclosure to be used in the manner prohibited by the act of 1853. The decision in Howe v. Dunn was disapproved of; and the House of Lords afterwards affirmed the decision of the court of appeal.

The Street Betting Act 1906 enacted that any person frequenting or loitering in streets or public places for the purpose of bookmaking, or betting, or wagering, should be liable on summary conviction, in the case of a first offence, to a fine not exceeding ten pounds, in the case of a second offence, to a fine not exceeding twenty pounds, and in the case of a third or subsequent offence, or in any case where he is proved to have committed the offence of having a betting transaction with a person under the age of sixteen years, to a fine, on conviction on indictment, not exceeding fifty pounds or to imprisonment with or without hard labour for a term not exceeding six months. On summary conviction the fine is a sum not exceeding thirty pounds or imprisonment with or without hard labour for a term not exceeding three months. A wide definition is given to the words "street" and "public place," and racecourses are expressly exempted from the operation of the act.

On all French racecourses (since 1866), as on others nearly everywhere else on the continent, and likewise in the British colonies, a system of betting known as the Paris Mutual or Totalizator, is carried on. Rows of offices are established behind or near the stands, on each of which lists are exhibited containing the numbers of the horses that are to run in the coming race. At some of these the minimum wager is five francs, at others ten, twenty, fifty, one hundred, five hundred and in some cases a thousand. The person who proposes to bet goes to the clerk at one of these offices, mentions the number, as indicated on the card, of the horse he wishes to back, and states whether he desires to bet on it to win or for a place only. He receives a voucher for his money. After the race the whole amount collected at the various offices is put together and divided after a percentage has been deducted for the administration and for the poor. As soon as this has been done, the money is divided and the prices to be paid to winners are exhibited on boards. These prices are calculated on a unit of ten francs. Thus, for instance, if the winner is notified as being in twenty-five francs, the meaning is that the backer receives his original stake of ten and fifteen in addition, the money being paid immediately by another clerk attached to the office at which the bet was made. The great French municipalities derive considerable revenue in relief of rates from the Paris Mutuels.

In Japan this system was made illegal in 1906.

**BETAÎNE** (OXYNIEURINE, LICYNINE), C₄H₆N₄O₇, a substance discovered in the sugar beet (Beta vulgaris) in 1869 by C. Scheibler (Ber., 1869, 2, p. 292). It is also found in cotton seed, in the vetch and in various other leguminous plants (Schultes and OH. F. Backer, 1893, 26, p. 2151). It may be synthetically prepared by nitrating choline with chromic acid (O. Liebreich, Ber., 1869, 9, 13), (CH₃)₂N(OH)·CH₂·CH₂OH→CH₂N₂NO₄+H₂O; by heating trimethylamine with monochloracetic acid (Liebreich), (CH₃)₂N+CH₂Cl·COOH=(CH₂N₂)(CH₂)·COOH (betaëne hydrochloride); and by heating amino-acetic acid (glycocol) with methyl iodide in the presence of an alkali (P. Griess, Ber., 1875, 8, p. 1406). It crystallizes from alcohol in large deliquescent crystals; and is readily soluble in water, but insoluble in ether. It is a weak base. As is shown by the various syntheses of the base, it is the methyl hydroxide of dimethylglycocol. This free base readily loses water on heating and gives an internal anhydride of constitution (CH₃)₂N(CH₂CO₂H)→CO₂+CO, which is the type of the so-called "betaënes." These organic betaines are internal anhydrides of carboxylic acids, which contain an ammonium hydroxide group in the α-position. A. Hantsch (Ber., 1886, 19, p. 31) prepared the betaënes of nicotinic, picolinic and collidine carboxylic acids from the potassium salts of the acids, by treatment with methyl iodide, followed by moist silver oxide. The reaction may be shown as follows:

![Betaïne structure](https://example.com/betaïne.png)

The methyl betaëne of nicotinic acid is identical with the alkaloid trigonelline, which was discovered in 1885 by E. Jahns in the seeds of Trigonella foenum-graecum (Ber., 1885, 18, p. 2518). It has also been obtained from nicotine by A. Pictet by oxidizing the methyl hydroxide of nicotine with potassium permanganate (Ber., 1897, 30, p. 2117).

Substances closely related to betaëne are choline, neurine and betaine. (Choline, 2-hydroxyethyltrimethylamine, sincline), (Gr. xoue, bile), CH₂H₄NO₄, HO·CH₂·CH₃·N·CH₃·CO₂H(4a), (β-a-Nor-strychnine). Streecker in 1862 (Ann. 123, p. 353; 148, p. 76), found it in the bile, in brain substance, and in yolk of egg in the form of lecinth, a complex ester of glycerin with phosphoric acid and the fatty acids. It is also found in combination with sinapic acid in sinapum, the glucoside obtained from white mustard, and can be obtained from this glucoside by hydrolysis with baryta water, CH₃H₂N₂+H₂O→CH₂·H₂O₂+N₂+H₂O₄. It can be synthetically prepared by the action of trimethylamine on an aqueous solution of ethylene oxide (A. Wurtz, Ann. Suppl., 1866, 6, p. 201). It forms deliquescent crystals of strongly alkaline reaction, and absorbs carbon dioxide from the air. It is not poisonous. By continued boiling of its aqueous solution, it is resolved into glycol and trimethylamine.

Neurine, trimethyl vinyl ammonium hydroxide (Gr. νευραινεν, nerve), CH₃·C·H·N·(CH₃)₂·OH, is a product of the putrefaction of albumen. It may be prepared by the action of moist silver oxide on ethylene dibromide and trimethylamine, CH₃Br·CH₃Br→CH₂Br·CH₂·N·(CH₃)₂·Br→CH₂·N·(CH₃)₂·H·OH·CH₂·N·(CH₃)₂·H·OH·
BETEL—BETHESDA

It is a crystalline solid, very soluble in water, and is strongly basic and very poisonous. Muscarine, C₉H₁₂NO₅, is an exceedingly poisonous substance found in many fungi. It may be obtained synthetically by oxidizing choline with dilute nitric acid (O. Schmiedeberg, J. prakt. Chem. 1879, 5, 34). The exact constitution has not yet been definitely determined.

**BETEL NUT.** The name betel is applied to two different plants, which in the East are very closely associated in the purposes to which they are applied. The betel nut is the fruit of the Areca or betel palm, Areca catechu, and the betel leaf is the produce of the betel vine or pan, Chavaca Betel, a plant allied to that which yields black pepper. The Areca palm is a native of the Malay Peninsula and Islands and is extensively cultivated over a wide area in the East, including southern India, Ceylon, Siam, the Malay Archipelago and the Philippine Islands. It is a graceful tree with a straight, slender, unbranched stem reaching 40 or 50 ft. in height and about 1½ ft. in circumference, and bearing a crown of 6-8 ft. for the genuine betel palms. The betel nut is about the size of a small hen's egg and within its fibrous rind is the seed or so-called nut, the albumen of which is very hard and has a prettily mottled grey and brown appearance. The chief purpose for which betel nuts are cultivated and collected is for use as a masticatory,—their use in this form being so widespread among Oriental nations that it is estimated that one-tenth of the whole human family indulge in betel chewing. For this use the fruits are annually gathered between the months of August and November, before they are quite ripe, and deprived of their husks. They are prepared by boiling in water, cutting up into slices, and drying in the sun, by which treatment the slices assume a dark brown or black colour. When chewed a small piece is wrapped up in a leaf of the betel vine or pan, with a pellet of shell lime or chunam; and in some cases a little cardamom, turmeric or other aromatic is added. The mastication causes a copious flow of saliva, of a briskly red colour, which dyes the mouth and teeth. Dehydration results in it being absorbed by those addicted to it that it strengthens the gums, sweetens the breath and stimulates the digestive organs. Among the Orientals betel is offered on ceremonial visits in the same manner as wine is produced on similar occasions by Europeans. Betel nuts are further used as a source of catechu, which is procured by boiling the nuts in water. The water of the first boiling becomes red and thick, and when this is insipid after the removal of the nuts it forms a catechu of high astringency and dark colour called in Bombay “Kossa.” The nuts are again boiled, and the insipid juice of the second decoction yields a weaker catechu of a brown or reddish colour. Betel nuts have been used by turners for ornamental purposes, and for coat buttons on account of the beauty of their structure. At one time they were supposed to be useful as a vermifuge. The nuts of other species of Areca are used by the poorer classes in the East as substitutes for tobacco. The alkaloid arecaidine, C₈H₁₉NO₄, occurs in areca or betel nuts, together with three other alkaloids: arecoline, C₉H₁₅NO₃, guvacine, C₄H₆NO₂, and arecine, C₅H₈NO₄. Arecaidine forms white crystals easily soluble in water, and difficulty soluble in alcohol. Chemically it is methyl-tetrahydro-pyridinic acid. Dehydration results in its formation of a “betaine,” which is a tetrahydro-trigoneoline (see Betaine). Arecoline is an oil, and the physiological action of the betel nut is alone due to this substance. Chemically it is the methyl ester of arecalide. Guvacine, named from “gucan,” an Indian designation of the betel palm, forms white crystals. It is a secondary base, but its constitution is uncertain. Arecaine is n-methyl-guvacine.

**BETHANY (mod. al-'Azariyyeh), a village nearly 2 m. E.S.E. from Jerusalem, on the eastern slope of the Mount of Olives, 2208 ft. above the sea. It is interesting as the residence of Lazarus and his sisters, and a favourite retreat of Jesus (see especially John xii., which describes the miracle of the resurrection of Lazarus at this place). From the 4th century down to the time of the Mahomedan invasion several ecclesiastical buildings were erected on the spot, but of these no distinct traces remain. El-'Azariyyeh is a poor village of about thirty families, with few marks of antiquity; there is no reason to believe that the houses of Mary and Martha and of Simon the Leper, or the sculpure of Lazarus, still shown by the monks, have any claim to the names they bear. Another Bethany (with the alternative reading Bethabara) is mentioned in John i. 28, as “beyond Jordan”; it has not been identified.

**BETHPHAL (Heb. “House of God”), originally called Lyse, an ancient city of Palestine, on the N.W. border of the tribe of Benjamin, 11 m. N. of Jerusalem and nearly 2900 ft. above sea-level. From very early times it was a holy place, a circumstance probably due primarily to a very extraordinary group of builders and rock-outcrops north of the town. Abraham recognized its sanctity (Gen. xii. 8); Jacob, in ignorance, slept in the sacred enclosure and was granted a vision ("Jacob's ladder," Gen. xxviii.). For a while the ark seems to have been deposited here (Judg. xx. 27), and it was a place for consulting the oracle (Judg. xx. 18). At the secession of the northern kingdom under Jeroboam, Bethel became a royal residence and a national shrine (1 Kings xii. 29-31, Amos vii. 13), for it was supposed to be the spot of his dream. He died from N. to S. and E. to W. well fitted it. It was taken from Jeroboam's Abijah, king of Judah (2 Chr. xiii. 19). It seems to have continued to flourish down into the Christian era; remains of its ecclesiastical buildings still exist. The present village, which bears the name of Beitin, occupies about three or four acres, and has a population of 2000.

**BÉTHENCOURT, JEAN DE (c. 1360-1422), French explorer, belonged to a noble family of Normandy, and held important offices at the court of Charles VI., king of France. His spirit was fired by hearing of the deeds of explorers and adventurers, and having formed a plan to conquer the Canary Islands he raised some money by pledging his Norman estates, and sailed from La Rochelle on the 1st of May 1402 with two ships, commanded by himself and Gadifer de la Salle. He was delayed by a mutiny off the coast of Spain, but reached the island of Lanzarote in July. Unable to carry out his project of conquest, he left his men at the Canary islands and went to seek help at the court of Castile. He obtained men and provisions from Henry III. king of Castile, through the good offices of his uncle, Robert de Braquemont, who had considerable influence with Henry; he also received the title of king, and did homage to Henry for his future conquests. Returning to the Canaries in 1404 he found that Gadifer de la Salle had conquered Lanzarote and Fuerteventura, and explored other islands. La Salle, unwilling to accept a position of inferiority, left the Canaries and appealed unsuccessfully for redress at the court of Castile. Béthencourt was unable to complete his work of conquest and exploration. In 1405 he visited Normandy, and returned with fresh colonists who occupied Hierro. In December 1406 he left the islands to the government of his nephew, Maciot de Béthencourt, reserving for himself the royal title and a share in any profits obtained. He returned to Normandy, where he appears to have lived for some years. Returning to the Canaries in 1422, he was buried in the church of Grainville la-Teinturière. Béthencourt wrote a very untrustworthy account of his "conquest of the Canary Islands," Le Canarien, livre de la conquête et conversion ses Canaries. This has been published with introduction and notes by G. Gravier (Rouen, 1874), and an English translation was edited by R. H. Major for the Hakluyt Society (London, 1872).

See also CANARY ISLANDS, for the controversy as to the relations between Béthencourt and La Salle.

**BÉTHESDA (i.e. “House of Mercy,” John v. 2), better perhaps Bethithaya or Bethsaida, a pool or public bath in Jerusalem, where miraculous cures were believed to be performed. The following identifications have been suggested: Birket Isra'il, near St Stephen's gate; a large cistern, near St Anne's church; the "Two pools," north of the Harem (the ancient Temple area); the "Hammam est-Beifa," or pool of healing, west of the Harem; the Virgin's fountain, south of the Harem, and the "Pool of Siloam." Which, if any, of these identifications is correct, it is impossible to say.

**BÉTHESDA, an urban district of Carnarvonshire, N. Wales, 5 m. from Bangor, by a branch of the London & North-Western railway. Pop. (1901) 5281. It lies near the lower end of the
fine Nant Ffrancon (valley of the Ogwen stream). The scriptural name is due, as often in Wales, to the village or hamlet taking its title from the Nonconformist church. Here are extensive slate quarries belonging to Lord Penrhyn. A narrow-gauge railway connects these with Port Penrhyn, at the mouth of the stream Cegid (hemlock, "cicuta"), which admits the entry of vessels of 300 tons to the quay at low water.

**BETH-HORON** ("the place of the hollow way"), the name of two neighbouring villages, upper and lower Beth-horon, on the ascent from the coast plain of Palestine to the high tableland of Benjamin, which was until the 16th century the high road from Jerusalem to the sea. The two towns thus played a conspicuous part in Israelitish military history (see Josh. x. 10; 1 Sam. xliii. 18; 1 Kings ix. 17; 1 Macc. iii. 13-24, vii. 30 ff., ix. 50). Josephus (Bell. Jud. ii. 19) tells of the rout of a Roman army under Cestius Gallus in A.D. 66. The Talmud states that many rabbis were born in the place. It is now represented by Beit 'Ur-el-foka and Beit 'Ur-et-tahta.

**BETHLEHEM** (Heb. "House of Bread," or, according to a more questionary etymology, "of the [god] Lakkhu"), a small town in Palestine, situated on a limestone ridge (250 ft. above sea-level), 5 m. S. of Jerusalem. The neighbourhood produces wheat, barley, olives and vines in abundance. It was occupied in very early times, though the references in Judges xvii., xix., and Ruth are of doubtful date. It was the early home of David and of Joab (2 Sam. ii. 32). It was fortified by Rehoboam, and in the neighbouring inn of Chinhim the murderers of Gedaliah took refuge (Jer. xii. 17). Micah (v. 2) and other writers speak of it as Bethlehem-Ephrathah: perhaps Ephrathah was the name of the district. Almost complete obscurity, however, was gathering round it when it became (according to Matt. ii. and Luke ii.) the birthplace of Jesus. The traditional scene of the Nativity, a grotto on the eastern part of the ridge, is alleged to have been desecrated during the reign of Hadrian by a temple of Adonis. In 330 it was enclosed by a basilica built by the orders of the emperor Constantine. This basilica (S. Maria a Praesepio), which is still standing, was restored and added to by Justinian, and was later surrounded by the three convents successively erected by the Greek, Latin and Armenian Churches (see de Vogüé, Les Églises de la Terre Sainte). Captured by the Crusaders in the 12th century, Bethlehem was made an episcopal see; but the bishopric soon sank to a titular dignity. Beside the grotto of the Nativity other traditional sites are shown within the church, such as the Altar of the Magi, the Tomb of Eusebius, the cave wherein Jerome made his translation of the Bible, &c.

There are several monasteries and convents, and British, French and German schools. The village is well built and comparatively few dwell in it. The population (8,000) has been diminished by Moslems since the Moslem quarter was destroyed by Ibrahim Pasha, in revenge for the murder of one of his favourites, after the insurrection of 1834. The carving of crucifixes and other sacred mementoes gives employment to a large proportion of the population. In 1830 a dispute arose between France and Russia, in the name of the Latin and Greek Churches respectively, concerning the possession of the key of the chief door of the basilica, and concerning the right to place a silver star, with the arms of France, in the grotto of the Nativity. The Porte, after much futile temporizing, yielded to France. The disappointment thus inflicted on Russia was a determining cause of the outbreak of the Crimean War (see Kinglake, Invasion of the Crimea, chap. iii.). There is a tiny village of the same name in Zebulun, 7 m. N.W. of Nazareth (Josh. xv. 19).

**SOUTH BETHLEHEM**. For the modern town see Palmer, "Das jetzige Bethlehem," in the Zeitschrift der deutschen Palästina-Verein, xvii. p. 89. (R. A. S. M.)

**BETHLEHEM**, a borough of Northampton and Lehigh counties, Pennsylvania, U.S.A., on the N. bank of the Lehigh river, opposite South Bethlehem and 35 m. N. by W. of Philadelphia. Pop. (1890) 6762; (1900) 7203; (1910) 8377; (1915) 12,837. It is served by the Central of New Jersey, the Lehigh & New England, the Lehigh Valley and the Philadelphia & Reading railways, and is connected by two long bridges with South Bethlehem. The borough lies on a ridge of ground commanding delightful landscape scenery extending north up the course of the river to the Blue Mountains, 20 m. away. In Church Street and its vicinity still stand several specimens of the 17th-century style of architecture of eastern Germany. The same sect that erected these buildings, the Moravians, or United Brethren, maintain here the Moravian College and Theological Seminary, and a well-known school for girls (the Moravian Seminary), founded as a church boarding school in 1740 and reorganized in 1785, for girls of all denominations. During the War of Independence, from December 1776 to April 1777, and from September 1777 to April 1778, the old Colonial Hall in this seminary (built 1748) was used as a general hospital of the continental army. From its roof the famous Moravian trombones were long played on festival or funeral occasions, and later summoned the people to musical festivals. The Moravians have given Bethlehem a national reputation as a musical centre. Only a few years after the city was founded, Benjamin Franklin was strongly impressed with the fine music in its church, and towards the close of the 18th century a choir under the direction of the organist, J. Frederick Wolle, became widely known by rendering for the first time in America Bach's St John Passion (in 1888), followed after short intervals by the St Matthew Passion, the Christmas Oratorio, the Mass in B Minor, and finally by an annual Bach festival continuing for three days, which was discontinued after Wolle's removal to the university of California in 1905. Bethlehem has often been called the American Bayreuth. Among the borough's industrial establishments, the manufactories of iron and steel are the most important, but it also manufactures brass, zinc, and silk and knit goods. The municipality owns and operates its waterworks. Bethlehem was founded by the Moravians, led by Count Nikolaus Ludwig Zinzendorf, shortly before Christmas in 1741, and the season of the year suggested its name; for the first century of its existence it was almost exclusively a settlement of that sect, and it is still their American headquarters. Bethlehem was incorporated as a borough in 1845. In 1904 the borough of West Bethlehem (pop. in 1900, 3465) was consolidated with Bethlehem.

**BETHLEHEMITES**, a name borne at different times by three orders in the Roman Catholic Church. (1) A community of friars at Cambridge, in 1257, whose habit was distinguished from that of the ordinary Dominicans by a five-rayed red star (in reference to Matt. ii. 9 f.). (2) An order of knighthood similar to the Knights of St John, established by Pius II. in 1459 to resist the inroads of the Turks. (3) The Bethlehemite Order of Guatemalans, a nursing community founded in 1650 by Pedro Betancourt (d. 1667), extended by the brothers Rodrigo and Antonio of the Cross, and raised to an order by Innocent XI. in 1687. They wore a dress like that of the Capuchins, and Clement XI. in 1707 gave them the privileges of the mendicant orders. They spread throughout Central America and Mexico and as far south as Lima, and with the order of sisters, founded in 1668 by Anna Maria del Galdo, were conspicuous for their devotion during times of plague and other contagious diseases. This order became extinct about 1850. The name Bethlehemites has also sometimes been given to the Hussites of Bohemia because their leader preached in the Bethlehem church at Prague.

**BETHLEN, GABRIEL** (Gábor) (1580-1629), prince of Transylvania, the most famous representative of the Íkári branch of a very ancient Hungarian family, was born at Ilyéf, and educated at Szarhegy, at the court of his uncle, András Lázár. Thence he was sent to the court of Prince Zichy of Béthlen, whom he accompanied on his famous Wallachian campaign in 1600. Subsequently he assisted Stephen Bocskay to mount the throne of Transylvania (1603), and remained his chief counsellor. Béthlen also supported Bocskay's successor Gabriel Báthory (1608-1613), but the prince became jealous of Béthlen's superior abilities, and he was obliged to take refuge with the Turks.
In 1613 he led a large army against his persecutor, on whose murder by two of his officers that year Bethlen was placed on the throne by the Porte, in opposition to the wishes of the emperor, who preferred a prince who would incline more towards Vienna than towards Constantinople. On the 13th of October 1613, the diet of Klausenburg confirmed the choice of the sultan. In 1615 Gábor was also officially recognized by the emperor Matthias. Bethlen no sooner felt firmly seated on his throne than he seized the opportunity presented to him by the outbreak of the Thirty Years' War to take up arms in defence of the liberties and the constitution of the extra-Transylvanian Hungarian provinces, with the view of more effectually assuring his own position. While Ferdinand was occupied with the Bohemian rebels, Bethlen led his armies into Hungary (1610), and soon won over the whole of the northern counties, even securing Pressburg and the Holy Crown. Nevertheless he was not averse to a peace, nor to a preliminary suspension of hostilities, and negotiations were opened at Pressburg, Kassa and Beszercezbreva successively, but came to nothing because Bethlen insisted on including the Bohemians in the peace, whereupon (20th of August 1620) the estates of North Hungary elected him king. Bethlen accepted the title but refused to be crowned, and war was resumed, till the defeat of the Czechs at the battle of the White Hill gave a new turn to affairs. In Bohemia, Ferdinand II., took a fearful revenge upon the vanquished; and Bethlen, regarding a continuation of the war as unprofitable, concluded the peace of Nikolsburg (31st of December 1621), renouncing the royal title on condition that Ferdinand confirmed the peace of Vienna (which had granted full liberty of worship to the Protestants) and engaged to summon a general diet within six months. For himself Bethlen secured the title of prince of the Empire, the seven counties of the Upper Thesius, and the fortresses of Tokaj, Munákcs and Esced. Subsequently Bethlen twice (1623 and 1626) took up arms against Ferdinand as the ally of the anti-Habsburg Protestant powers. The first war was concluded by the peace of Vienna, the second by the peace of Pressburg, both confirmatory of the peace of Nikolsburg. After the second of these insurrections, Bethlen attempted a rapprochement with the court of Vienna on the basis of an alliance against the Turks and his own marriage with one of the Austrian archduchesses; but Ferdinand had no confidence in him and rejected his overtures. Bethlen was obliged to renounce his anti-Turkish projects, which he had hitherto cherished as the great aim and object of his life, and continue in the old beaten paths. Accordingly, on his return from Vienna he wedded Catherine, the daughter of the elector of Brandenburg, and still more closely allied himself with the Protestant powers, especially with Gustavus Adolphus of Sweden, who, he hoped, would assist him to obtain the Polish crown. He died before he could accomplish any of his great designs (15th of November 1629), having previously secured the election of his wife Catherine as princess. His first wife, Susannah Károlyi, died in 1622.

Gabriel Bethlen was certainly one of the most striking and original personages of his century. A zealous Calvinist, whose boast it was that he had read the Bible twenty-five times, he was nevertheless no persecutor, and even helped the Jesuit Kalandy to translate and print his version of the Scriptures. He was in communication all his life with the leading contemporary statesmen, so that his correspondence is one of the most interesting and important of historical documents. He also composed hymns.

The best editions of his correspondence are those by Sándor Sedlák (Budapest, 1866 and 1870) and both published at Buda (1886 and 1891). Of his letters the best is that by the Bohemian historian Anton Grubler, Acta et documenta historiarum Gabrielis Bethleini illustrantia (Budapest, 1890). This work has been largely utilized by Ignác-Acsády in his excellent Gabriel Bethlen (Budapest, 1893) (Hung., 1894) (R. N. B. 11578-11600).

BETHNAL GREEN, part of the London County, bounded N. by Hackney, E. by Poplar, S. by Stepney and W. by Shoreditch. Pop. (1901) 129,680. It is a district of poor houses, forming part of the area commonly known as the "East End." The working population is employed in the making of match-boxes, boot-making, cabinet-making and other industries; but was formerly largely devoted to silk-weaving, which spread over the district from its centre in Spitalfields (see Stepney). This industry is still maintained. The Bethnal Green museum was opened in 1872. It contains exhibits of food and animal products, formerly at South Kensington, entomological collections, &c.; and various loan exhibitions are held from time to time. The Museum also housed the Wallace collection until the opening of Hertford House, and the pictures now in the National Portrait Gallery. It stands in public gardens; there are several other small open spaces; and some 70 out of the 217 acres of Victoria Park are within the borough. Close by the park there stood, until the 19th century, a house believed to have belonged to the notorious Bishop Bonner, the persecutor of Protestants in the reign of Mary; his name is still attached to a street here. Among institutions are the missionary settlement of the Oxford House, founded in 1884, with its women's branch, St Margaret's House; the North-Eastern hospital and children, the Craft school and the Leather Trade school. The parliamentary borough of Bethnal Green has two divisions, each returning one member. The borough council consists of a mayor, 5 aldermen and 30 councillors. Area, 759-3 acres.

BÉTHUNE (FAMILY). The seigneurs de Béthune, avoués (advocati) of the great abbey of Saint-Vaast at Arras from the 12th century, were the ancestors of a great French house whence sprang the dukes of Sully, Charost, Orval, and Ancenis; the marquises of Rosny, Courville and Chabris; the counts of Selles and the princes of Boisbelle and Henrichemont. Conon de Béthune (q.v.), the crusader and poet, was an early forebear. The most illustrious member of the Béthune family was Maximilian, baron of Rosny, and afterwards duke of Sully (q.v.), minister of Henry IV. His brother Philip, count of Selles and of Charost, was ambassador to Scotland, Rome, Savoy and Picardy, and died in 1649. Hippolyte de Béthune, count of Selles and marquis of Chabris, who died in 1555, bequeathed to the king a magnificent collection of historical documents and works of art. The Charost branch of the family gave France a number of generals during the 17th and 18th centuries.

The last duke of Charost, Armand Joseph de Béthune (1738–1800), French economist and philanthropist, served in the army during the Seven Years' War, after which he retired to his estates in Berry, where, and also in Brittany and Picardy, he sought to ameliorate the lot of his peasants by abolishing feudal dues, and introducing reforms in agriculture. During the Terror he was arrested, but was liberated after the 9th Thermidor.

He was mayor of the 19th arrondissement of Paris under the Consulate, and died at Paris on the 27th of October 1800, of small-pox, contracted during a visit to a workshop for the blind which he had founded. He published essays on the way to destroy mendicancy and to improve the condition of the labourers, and also on the establishment of a fund for rural relief and the organization of rural education. His life throws light on some phases of the ancien régime which are often overlooked by historians. Louis XV. said of Charost, "Look at this man, his appearance is insignificant, but he has put new life into three of my provinces." His only son, Armand Louis de Béthune, marquis de Charost, was beheaded on the 28th of April 1794.

BÉTHUNE, CONON or QUESNES, DE (c. 1150–1224), French troubadour of Arras, was born about the middle of the 12th century. He came about 1180 to the court of France, where he met Marie de France, countess of Champagne. To this princess his love poems are dedicated, and much of his time was passed at her court where the troubères were held in high honour. At the French court he met with some criticisms from Queen Alix, the widow of Louis VII., on the roughness of his verse and on his Picard dialect. To these criticisms, interesting as proof of the already preponderant influence of the dialect of his native place, the poet replied by some verses in the satirical vein that best suited his temperament. Some of his best songs were inspired by anger at the delays before the crusade of 1188–1192. His plain-speaking made him many enemies, and when he returned
with the rest after the fruitless capture of Acre, these were not slow to take advantage of the opportunity for retaliation. Conon took part with Baldwin of Flanders in the crusade which resulted in 1204 in the capture of Constantinople, and he is said to have been the first to plant the crusaders’ standard on the walls of the city. He held high office in the new empire and died about 1224. His verses, of which the crusading song Amor com dure departir is well known, are marked by vigour and martial spirit which distinguish them from the work of other trouvères.

The complete edition of his works is in the Trouvères belges of Aug. Scheler (1876).

BÉTHUNE, a town of northern France, capital of an arrondissement in the department of Pas-de-Calais, 24 m. N.N.W. of Arras, on the Northern railway between that town and St Omer. Pop. (1906) 12,601. Béthune is situated on a low hill at the confluence of the Lave with the canal from Aire to Bouvignes. Once strongly fortified, it is now surrounded by wide boulevards, and new quarters have grown up on its outskirts. The old town is composed of winding streets and culs-de-sac bordered by old houses in the Flemish style. A few remains of the fortressANELLS and the towers and gates of the old walls of northern France, a square structure surmounted by a wooden campanile, dating from the 14th century. St Vaast, the principal church of Béthune, belongs to the 16th century. The town is the seat of a sub-prefecture, and has a tribunal of first instance, a chamber of commerce and a communal college among its public institutions. Béthune lies in the midst of the richest coal mines in France. Its industries include the distillation of oil, tanning, salt-refining, brewing, and the manufacture of earthenware and earthenware and glass. Trade is carried on in flax, cloth, cereals, oilseeds, &c.

The town, which dates from the 11th century, was governed by its own lords till 1248, after which date it passed through the ownership of the counts of Flanders, the dukes of Burgundy and the kings of France and Spain. Ceded to France by the peace of Nijmegen (1678), it was taken by the allied forces in 1710, and restored to France by the treaty of Utrecht.

BETROTHAL (A.S. treowth, “truth”), the giving “one’s truth,” or pledging one’s faith to marry. Although left optional by the church and not necessary in law, betrothal was anciently a formal ceremony which in most cases preceded the actual marriage service, usually by a period of some weeks, but the marriage might have various reasons be delayed for years. The canon law distinguished two types of betrothal:—(1) Sponsalia de præsencti, (2) Sponsalia de futuro. The first was a true though irregular marriage, and was abolished by the council of Trent as leading to clandestine unions and therefore being incompatible with the religious life. The second, or betrothal properly so called, was a promise to marry at a future date, which promise without further ceremony became a valid marriage upon consummation. The church never precisely determined the form of the ceremony, but demanded for its validity that it should have been entered into freely and at a legal age, i.e. after the seventh birthday. The church further declared that females between the ages of seven and twelve, and males between seven and fourteen, could be betrothed, but not married, and that all such betrothals were to be public. The ill-defined laws as to betrothals tended to encourage abuses; and the people, especially in the rural districts, inclined to hold betrothal sufficient justification for cohabitation. Such pre-contract is known to have existed in the case of Shakespeare (q.v.). Francis Douce (History of the English Language, 2nd ed., 1807) says that betrothal consisted of the “interchange of rings—the kiss—the joining of hands, to which is to be added the testimony of witnesses.” In France the presence of a priest seems to have been considered essential, and though this was not so elsewhere it was customary for the couple to get their parish priest to witness their promise. In England solemn betrothal was almost universally practised. Among the peasantry the place of rings was taken by a coin which was broken between the pair, each taking a part. But almost any gift sufficed. A case in 1382 is recorded where the lover gave the girl a pair of gloves, two oranges, two handkerchiefs and a red silk girdle. Sometimes the bride-elect received a bent or crooked sixpence. At the conclusion of the ceremony, which by no means always took place in a church, it seems to have been usual for the couple to pledge each other in a cup of wine, as do the Jews and Russians to-day. This binding together was over the universal custom of parties in ratification of a bargain. Joseph Strutt (1749–1802) states that by the civil law gifts given at betrothal could be recovered by the parties, if the marriage did not take place. But only conditionally, for if the man “had a kiss for his money, he should lose one half of that which he gave. Yet with the woman it is otherwise, for, kissing or not kissing, whatever she gave, she may ask and have it again. However, this extends only to gloves, rings, bracelets and such-like small wares.” Though the church abstained from prescribing the form of the ceremony, it jealously watched over the fulfilment of such contracts and punished their violation. Betrothal, validly contracted, could be dissolved either by mutual consent, or by the supervening of some radical physical or social change in the parties. This, in the words of the conduct, is one of the conditions of the contract. But here the church stepped in, and endeavoured to overcome such law as existed in the matter by decreeing that whoever, after betrothal, refused to marry in facie ecclesiae, was liable to excommunication till relieved by public penance. In England the law was settled by an act of 1753, which enacted that an aggrieved party could obtain redress only by an action at common law for breach of promise of marriage (see MARRIAGE).

Formal betrothal is no longer customary in England, but on the European continent it retains much of its former importance. There it is either solemn (publicly in church) or private (simply before witnesses). Such betrothals are legal contracts. They are only valid between persons of legal age, both of whom consent, and they are rendered void by fraud, intimidation and duress. The period of delay is only so that the parties may avoid inconvenient legal consequences; it is in fact a matter of convenience; but if there be unreasonable withheld the couple may appeal to a magistrate, who can sanction the betrothal. If the parents disagree, the father’s wish prevails. Public betrothal carries with it an obligation to marry, and in case of refusal an action for “betrothal” (see MARRIAGE), and in Germany the betrothal is generally celebrated before the relatives, and the couple are called bride and bridegroom from that time until marriage. In Russia, where it was once as binding as marriage, it is now a mere formal part of the marriage ceremony.

Among the ancient Jews betrothal was formal and as binding as marriage. After the ceremony, which consisted of the handing of a ring or some object of value to the bride and formal reading of the contract, and the mutual pledging of the couple in consecrated wine, a period of twelve months elapsed before the marriage was completed by the formal home-taking; unless the bride was a widow or the groom a widower, when this interval was reduced to thirty days. Latterly the ceremony of betrothal has become a part of the marriage ceremony, and the engagement has become the informal affair it is in England.

For betrothal customs in China, see K. L. Milne, Warnings and Weddings in Many Climes (London, 1900), and A. H. Balfour,ifting Custom in the Chinese and Malay Lands (London, 1898). See also J. O. Halliwell-Phillipps, Outlines of the Life of Shakespeare (London, 1848, 1883).

BETTERMENT (i.e. “making better,” as opposed to “worsement”), a general term, used particularly in connexion with the increase in value given to real property by causes for which a tenant or the public, but not the owner, is responsible; it is thus of the nature of “unearned increment.” When, for instance, some public improvement results in raising the value of a piece of private land, and the owner is thereby “bettered” through no merit of his own, he gains by the betterment, and many economists and politicians have sought to arrange, by taxation or otherwise, that the increased value shall come into the pocket of the public rather than into his. A betterment tax would be so assessed as to divert from the owner of the property the profit
thus accruing “uneared” to him. (See also Compensation.) The whole problem is one of the incidence of taxation and the question of land values, and various applications of the principle of betterment have been tried in America and in England, raising considerable controversy from time to time.

See A. A. Baumann, Betterment, Worsenment and Recompence (1894).

**BETTERTON, THOMAS** (c. 1635–1710), English actor, son of an under-cook to King Charles I., was born in London. He was apprenticed to John Holden. Sir William Davenant's publisher, and possibly later to a bookseller named Rhodes, who had been wardrobe-keeper to the theatre in Blackfriars. The latter obtained in 1639 a licence to set up a company of players at the Cockpit in Drury Lane; and on the reopening of this theatre in 1660, Betterton made his first appearance on the stage. His talents at once brought him to prominence, and he was given leading parts. On the opening of the new theatre in Lincoln's Inn Fields in 1661, Sir William Davenant, the patentee, engaged Betterton and all Rhodes's company to play in his Siege of Rhodes. Betterton, besides being a public favourite, was held in high esteem by Charles II., who sent him to Paris to examine stage improvements there. According to Cibber it was after his return that shifting scenes instead of tapestry were first used in an English theatre. In 1692, in an unfortunate speculation, Betterton and his friend Sir Francis Watson were ruined; but Betterton's affection for Sir Francis was so strong that he adopted the latter's daughter and educated her for the stage. In 1693, with the aid of friends, he erected the New Playhouse in the tennis court in Lincoln's Inn Fields. It was opened in 1695 with Congreve's Love for Love. But in a few years the profits fell off; and Betterton, labouring under the infirmities of age and gout, determined to quit the stage. At his benefit performance, when the profits are said to have been over £500, he played Valentine in Love for Love. In 1710 he made his last appearance as love-sick Tedalus in Troilus and Cressida; he died on the 28th of April, and was buried in Westminster Abbey.

In appearance he was athletic, slightly above middle height, with a tendency to stoutness; his voice was strong rather than melodious, but in recitation it was used with the greatest dexterity. Pepys, Pope, Steele and Cibber all bestow lavish praise on his acting. His repertory included a large number of Shakespearean roles, and although many of these were presented in the tasteless versions of Davenant, Dryden, Shadwell and Nahum Tate, yet they could not hide the high histrionic gifts which Betterton possessed, nor does his reputation rest on these performances alone. The blameworthiness of his life was conspicuous in an age and a profession notorious for dissolute habits. Betterton was author of several adaptations which were popular in their day. In 1662 he had married Mary Sanderson (d. 1712), an admirable actress, whose Ophelia shared the honours with his Hamlet.

See Howe, Thomas Betterton (1891); The Life and Times of Thomas Betterton (1886).

**BETTIA,** a town of British India, in the Champaran district of Bengal; situated on a former branch of the Harba river, with a station on the Tirhoot section of the Bengal & North-Western railway. Bettia is the residence of one of the leading noblemen of northern Behar, who enjoys a rent-roll of £66,000. In 1901, owing to a disputed succession, the estate was under the management of the court of wards. It comprises land in no fewer than ten districts, much of which is let on permanent leases to indigo-planters. Besides the palace of the maharaja, the town contains a middle English school and a female dispensary, entirely supported out of the estate. There is a Roman Catholic mission, with about 1,000 converts, which was founded by an Italian priest in 1746.

**BETTINI, SAVESIO** (1718–1808), Italian Jesuit and man of letters, was born at Mantua on the 18th of July 1718. After studying under the Jesuits in his native city and at Bologna he entered the society in 1736. He taught the belles-lettres from 1730 to 1744 at Brescia, where Cardinal Quirini, Count Mazzuchelli, Count Duranti and other scholars, formed an illustrious academy. He next went to Bologna, to pursue the study of divinity, and there he enjoyed the society of many learned and literary men. At the age of thirty he went to Venice, where he became professor of rhetoric, and was on friendly terms with the most illustrious persons of that city and state. The superintendence of the college of nobles at Parma was entrusted to him in 1751; and he had principal charge of the studies of poetry and history, and the entertainments of the theatre. He remained there eight years, visiting, at intervals, other cities of Italy, either on the affairs of his order, for pleasure or for health. In 1755 he traversed part of Germany, proceeded as far as Strassburg and Nancy, and returned by way of Germany into Italy, taking with him two young sons or nephews of the prince of Hohenlohe, who had requested him to take charge of their education. He made, the year following, another journey into France, along with the eldest of his pupils; and during this excursion he wrote his famous Lettere di Virgilio agli Argoli, which were published at Oxford with his sciolti versi, and those of Frugoni and Algarotti. The opinions maintained in these letters against the two great Italian poets and particularly against Dante, created him many enemies, and embroiled him with Algarotti. In 1758 he went into Lorraine, to the court of King Stanislaus, who sent him on a matter of business to visit Voltaire. Voltaire presented him with a copy of his works, with a flattering inscription in allusion to Bettinelli's Letters of Virgil. From Geneva he returned to Parma, where he arrived in 1759. He afterwards lived for some years at Verona and Modena, and he had just been appointed professor of rhetoric there, when, in 1773, the order of Jesuits was abolished in Italy. Bettinelli then returned into his own country, and resumed his literary labours with new ardour. The siege of Mantua by the French compelled him to leave the city, and he retired to Verona, where he formed an intimate friendship with the chevalier Hippolito Pindemonte. In 1799 he returned to Mantua. Though nearly eighty years old, he resumed his labours and his customary manner of life. He undertook in 1799 a complete edition of his works, which was published at Venice in 24 vols. 12mo. Arrived at the age of ninety years, he still retained his gaiety and vivacity of mind, and died on the 13th of September 1808. The works of Bettinelli are now of little value. The only one still deserving remembrance, perhaps, is the Risorgimento negli stagi, nelle Arti e nei Comodi dopo il Mille (1775–1786), a sketch of the progress of literature, science, the fine arts, industry, &c., in Italy.

**BETTWS Y COED,** an urban district of Carmarvonshire, North Wales, 4 m. from Llanrwst and 16 m. from Llandudno, on a branch of the London & North-Western railway. Pop. (1901) 1070. The name means “warm place of the wood,” according to Llyn's definition of bettws. The other derivation of the word from Abbatis (domus) agrees with its vicinity to Yspytty 1Han (Teuan), Hamlet (Pepys), Yspytty (Tate). The words "y coed" are added to distinguish this Bettws from several others in Wales, especially that near Llandeilo Fawr, Carmarthenshire, not far from the Bettws hills. Bettws y coed is a favourite village for artists and tourists. It is a centre for excursions towards Capel Curig and Snowdon, or towards Blaenau Ffestiniog, via Roman Bridge. There is excellent fishing for salmon and trout, and in summer coaches leave their daily loads of tourists here. The best-known streams and waterfalls are Llugwy, Lledr, with Rhiaadr y wenol (Swallow falls), Conway and Machinials. In the neighbourhood are Dolwyddelan castle and the hill of Moel Siabod.

**BETY, WILLIAM HENRY WEST** (1791–1874), English actor, known as “the young Roscius,” was born on the 13th of September 1791 at Shrewsbury. He first appeared on the stage at Belfast before he was twelve years old, as Osman in Aaron Hill’s Zara, an English version of Voltaire’s Zétié. His success was immediate, and he shortly afterwards appeared in Dublin, where it is said that in three hours of study he committed the

1 Other places named “Yspytty” are Y. Cyfnyn and Y. Ystrwyth. For the name “Yspytty” see, in “The King John,” 225: “So many maesedecens (maisons Dies), hospita and spyttie howses.”
part of Hamlet to memory. His precocious talents aroused great enthusiasm in Glasgow and Edinburgh, and he was favourably compared with some of the greatest tragedians. In 1804 he first appeared at Covent Garden, when the troops had to be called out to preserve order, so great was the crush to obtain admittance. At Drury Lane the house was similarly packed, and he played for the then unprecedented salary of over 75 guineas a night. He was a great success socially, George III. himself presenting him to the queen, and Pitt upon one occasion adjourning the House of Commons that members might be in time for his performance. But this enthusiasm gradually subsided, and in 1808 he made his final appearance as a boy actor, and entered Christ's College, Cambridge. He reappeared four years later, but the public would have none of him, and he retired to the enjoyment of the large fortune which he had amassed as a proddy. He died on the 24th of August 1874. His son Henry Betty (1810–1897) was also an actor.

**BETUL,** a town and district of British India, in the Nerbudda division of the Central Provinces. In 1901 the population of the town was 47,931. The administrative headquarters of the district have been transferred to the town of Badnur (q.v.), 3 m. north.

The district of **Betul** has an area of 38,664 sq. m. In 1901 the population was 282,636, showing a decrease of 12% in the decade, due to the results of famine. The mean elevation above the sea is about 2000 ft. The country is essentially a highland tract, divided naturally into three distinct portions, differing in their superficial aspects, the character of their soil and their geological formation. The northern part of the district forms an irregular plain of the sandstone formation. It is a well-wooded tract, in many places stretching out in charming glades like an English park, but it has a very sparse population and little cultivated land. In the extreme north a line of hills rises abruptly out of the great plain of the Nerbudda valley. The central tract alone possesses a rich soil, well watered by the Machna and Sampna rivers, almost entirely cultivated and studded with villages. To the south lies a rolling plateau of basaltic formation (with the sacred town of Multai, and the springs of the river Tapti at its highest point), extending over the whole of the southern face of the district, and finally merging into the wild and broken line of the Ghats, which lead down to the plains. This tract consists of a succession of stony ridges of trap rock, enclosing valleys or basins of fertile soil, in which cultivation is for the most part confined, except where the shallow soil on the tops of the hills has been turned to account. The principal crops are wheat, millet, other food-grains, pulse, oil-seeds, and a little sugar-cane and cotton. A large part of the area is covered with forests, which yield teak and other timber. The only manufacture is cotton cloth. A railway is projected from Itarsi through the district to Bar. General red of his few; and none of the rivers is navigable. This district suffered very severely from the famine of 1896–1897, in 1897 the death-rate being as high as 73 per 1000. It suffered again in 1900, when in May the number of persons relieved was to one-third of the total population.

Little is known of the early history of the district except that it must have been the centre of the first of the four ancient Gond kingdoms of Kherla, Deogah, Mandla and Chanda. According to Ferishta, the Persian historian, these kingdoms engrossed in 1398 all the hills of Gondwana and adjacent countries, and were of great wealth and power. About the year 1418 Sultan Husain Shah of Malwa invaded Kherla, and reduced it to a dependency. Nine years later the jangle rebelled, but although with the help of the Bahmani kings of the Deccan he managed for a time to assert his independence, he was finally subdued and deprived of his domains by Muhammad bin Tughlak, the Bahmani king, but was afterwards restored to Malwa. Around this period the kingdom of Malwa became incorporated into the dominions of the emperor of Delhi. In 1703 a Musulman convert of the Gond tribe held the country, and in 1743 Raghoji Bhonsla, the Mahatta ruler of Bara, annexed it to his dominions. The Marathas in the year 1818 ceded this district to the East India Company as payment for a contingent, and by the treaty of 1826 it was formally incorporated with the British possessions.

Detachments of British troops were stationed at Multai, Betul and Shahpur to cut off the retreat of Apa Sahib, the Mahatta general, and a military force was quartered at Betul until June 1862. The ruined city of Kherla formed the seat of government under the Gonds and preceding rulers, and hence the district was, until the time of its annexation to the British dominions, known as the "Kherla Sarkar." The town of Multai contains an artificial tank, from the centre of which the Tapti is said to take its rise: hence the reputed sanctity of the spot, and the accumulation of temples in its honour.

The climate of Betul is fairly healthy. Its height above the plains and the neighbourhood of extensive forests moderate the heat, and render the temperature pleasant throughout the greater part of the year. During the cold season the thermometer at night falls below the freezing point; little or no hot wind is felt before the end of April, and even then it ceases after sunset. The nights in the hot season are comparatively cool and pleasant. During the monsoon the climate is very damp, and at times very cold and raw, thick clouds and mist enveloping the sky for many days together. The average annual rainfall is 40 in. In the denser jungles malaria prevails for months after the cessation of the rains, but the Gonds do not appear to suffer much from its effects. Travellers and strangers who venture into these jungles run the risk of fever of a severe type at almost all seasons of the year.

**Betwa,** a river of India, which rises in the native state of Bhopal in Malwa, and after a course of 360 m., for the most part in a north-easterly direction, falls into the Jumna at Hamipur. A weir is thrown across the Betwa about 15 m. from Jhansi town, whence a canal 168 m. long takes off, irrigating 166,000 acres of the Jalaun district; similar works have been carried out elsewhere on the river.

**Beaudant, François Sulpice** (1757–1850), French mineralogist and geologist, was born at Paris on the 5th of September 1787. He was educated at the École Polytechnique and École Normale, and in 1811 was appointed professor of mathematics at the lycée of Avignon. Thence he was called, in 1813, to the lycée of Marseilles to fill the post of professor of physics. In the following year the royal mineralogical cabinet was committed to his charge to be conveyed into England, and from that time his attention was directed principally towards geology and cognate sciences. In 1817 he published a paper on the phenomena of crystallization, treating especially of the variety of forms assumed by the same mineral substance. In 1818 he undertook, at the expense of the French government, a geological journey through Hungary, and the results of his researches, Voyage minéralogique et géologique en Hongrie, 3 vols. 4to, with plates, published in 1822, established for him a European reputation. In 1820 he was appointed to the professorship of mineralogy in the Paris Faculty of Sciences, and afterwards became inspector-general of the university. He subsequently published treatises on physics and on mineralogy and geology, and died on the 20th of December 1850.

**Beugnot, Jacques Claude,** Count (1761–1835), French politician, was born at Bar-sur-Aube. A magistrate under the old régime, he was elected deputy to the Legislative Assembly (1791), then to the Convention. He was involved in the proscription of the Girondists and imprisoned until the 9th Thermidor. He next entered into relations with the family of Bonaparte, and in 1796, after the 18th Brumaire, again entered politics, becoming successively prefect of the lower Seine, councillor of state, and finance minister to Jerome Bonaparte. In 1807 Kherla was seized by the Bahmani king, but was afterwards restored to Malwa. A century later the kingdom of Malwa became incorporated into the dominions of the emperor of Delhi. In 1703 a Musulman convert of the Gond tribe held the country, and in 1743 Raghoji Bhonsla, the Mahatta ruler of Bara, annexed it to his dominions. The Marathas in the year 1818 ceded this district to the East India Company as payment for a contingent, and by the treaty of 1826 it was formally incorporated with the British possessions.
one of his confidants. He contributed to draw up Louis's charter, and in his memoirs boasted of having furnished the text of the proclamation addressed by the king to the French people before his return to France; but it is known now that it was another text that was adopted. Lacking the support of the ultra-royalists, he was given the title of minister without portfolio, with the equivalent of a retirement. Elected deputy, he attached himself to the moderate party, and defended the liberty of the press. In 1831 Louis Philippe made him a peer of France and director-general of manufactures and commerce. He died on the 24th of June 1835.

His son, AUGUSTE ARTHUR BEUGNOT (1797–1865), was an historian and scholar, who published an Essai sur les institutions de Saint Louis (1821), Histoire de la destruction du pagnerie en occident (2 vols., 1885), and edited the Olim of the parlement of Paris, the Assises de Jerusalem, and the Coutumes de Beauvaisis of Philippe de Beaumanoir. He was a member of the chamber of peers under Louis Philippe, and opposed Villenain's plan for freedom of education. After 1848 he maintained the same rôle, acting as reporter of the loi Folloux. He retired from public life after the coup d'état of Napoleon III., and died on the 15th of March 1865.

The Mémoires of J. C. Beugnot were published by his grandson, Count Albert Beugnot (2nd ed., Paris, 1868); see H. Wallon, Éloges académiques (1882); and E. Dejean, Un Prétét du Consulat: J. C. Beugnot (Paris, 1907).

BEULÉ, CHARLES ERNEST (1826–1894), French archaeologist and politician, was born at Saumur on the 29th of June 1826. He was educated at the École Normale, and after having held the professorship of rhetoric at Moulins for a year, was sent to Athens in 1851 as one of the professors in the École Française there. He had the good fortune to discover the propylae of the Acropolis, and his work, L'Acropole d' Athènes (2nd ed., 1863), was published by order of the minister of public instruction. On his return to France, promotion and distinctions followed rapidly upon his first successes. He was made doctor of letters, chevalier of the Legion of Honour, professor of archaeology at the Bibliothèque Impériale, member of the Académie des Inscriptions et Belles-Lettres and perpetual secretary of the Académie des Beaux-Arts. He took great interest in political affairs, with which the last few years of his life were entirely occupied. Elected a member of the National Assembly in 1871, he zealously supported the Orleanist party. In May–November 1872 he was minister of the interior in the Broglie ministry. He died by his own hand on the 4th of April 1874. His other important works are: Études sur le Péléonpode (2nd ed., 1875); Les Monnaies d' Athènes (1858); L'Architecture au siècle de Pissistrate (1860); Foulées à Carthage (1861). Beulé was also the author of high-class popular works on artistic and historical subjects: Histoire de l'art grec avant Pélicles (2nd ed., 1870); Le Procès des Césars (1867–1870, in four parts; Auguste, sa famille et ses amis; Tible et l'hériliste d'Auguste; Le Sang de Germanicus; Titus et sa dynastie).

See Ideville, Monsieur Beulé, Souvenirs personnels (1874).

BEURNONVILLE, PIERRE DE RUEL, MARQUIS DE (1752–1821), French general. After service in the colonies, he married a wealthy Creole, and returning to France purchased the post of lieutenant of the Swiss guard of the count of Provence. During the Revolution he was named lieutenant-general, and took an active part in the battles of Valmy and Jemmapes. Minister of war in February 1793, he denounced his old commander, C. F. Dumouriez, to the Convention, and was one of the four deputies sent to watch him. Given over by him to the Austrians on the 3rd of April 1793, Beurnonville was not exchanged until November 1795. He entered the service again, commanded the armies of the Sambre-et-Meuse and of the North, and was appointed inspector of infantry of the army of England in 1798. In 1800 he was sent as ambassador to Berlin, in 1802 to Madrid. Napoleon made him a senator and count of the empire. In 1814 he was a member of the provisional government organized after the abdication of Napoleon, and was created a peer of France. During the Hundred Days he followed Louis XVIII. to Ghent, and after the second restoration was made marquis and marshal of France.

BEUST, FRIEDRICH FERDINAND VON (1809–1886), Austrian statesman, was descended from a noble family which had originally sprung from the Mark of Brandenburg, and of which one branch had been for over 300 years settled in Saxony. He was born on the 1st of January 1809 in Dresden, where his father held office at the Saxon court. After studying at Leipzig and Göttingen he entered the Saxon public service; in 1836 he was made secretary of legation at Berlin, and afterwards held appointments at Paris, Munich and London. In March 1848 he was summoned to Dresden to take the office of foreign minister, but in consequence of the outbreak of the revolution was not appointed. In May he was appointed Saxon envoy at Berlin, and in February 1849 was again summoned to Dresden, and this time appointed minister of foreign affairs, an office which he continued to hold till 1866. In addition to this he held the ministry of education and public worship from 1849 to 1853; that of internal affairs in 1855; and in the same year was appointed minister-president. From the time that he entered the ministry he was, however, the leading member of it, and he was chiefly responsible for the events of 1849. By his advice the king refused to accept the constitution proclaimed by the Frankfort parliament, a policy which led to the outbreak of war in Dresden, which was suppressed after four days' fighting by Prussian troops, for whose assistance Beust had asked. On Beust fell also the chief responsibility for governing the country after order was restored, and he was the author of the so-called coup d'état of June 1850 by which the new constitution was overthrown. The vigour he showed in repressing all resistance to the government, especially that of the university, and in reorganizing the police, made him one of the most unpopular men among the Liberals, and his name became synonymous with the worst form of reaction, but it is not clear that the attacks on him were justified. After this he was chiefly occupied with foreign affairs, and he soon became one of the most conspicuous figures in German politics. He was the leader of that party which hoped to maintain the independence of the smaller states, and was the opponent of all attempts on the part of Prussia to attract them into a separate union; in 1849–1850 he had been obliged to join the anti-Prussian, Hanover and Saxony, but he was careful to keep open a loophole for withdrawal, of which he speedily availed himself. In the crisis of 1851 Saxony was on the side of Austria, and he supported the restoration of the diet of the confederation. In 1854 he took part in the Bamberg conferences, in which the smaller German states claimed the right to direct their own policy independent of that of Austria or of Prussia, and he was the leading supporter of the idea of the Trias, i.e. that the smaller states should form a closer union among themselves against the preponderance of the great monarchies. In 1863 he came forward as a warm supporter of the claims of the prince of Augustenburg to Schleswig-Holstein (see SCHLESWIG-HOLSTEIN QUESTION); he was the leader of the party in the German diet which refused to recognize the settlement of the Danish question effected in 1852 by the treaty of London, and in 1864 he was appointed representative of the diet at the congress of London. He was thus thrown into opposition to the policy of Bismarck, and he was exposed to violent attacks in the Prussian press as a "particularist," i.e. a supporter of the independence of the smaller states. The expulsion of the Saxon troops from Rendsburg nearly led to a conflict with Prussia. Beust was accused of having brought about the war of 1866, but the responsibility for this must rest with Bismarck. On the outbreak of war Beust accompanied the king to Prague, and thence to Vienna, where they were received by the emperor with the news of Königgrätz. Beust undertook a mission to Paris to procure the help of Napoleon. When the terms of peace were discussed he resigned, for Bismarck refused to negotiate with him.

After the victory of Prussia there was no place for Beust in
BEUTEN—BEVERLEY, W. R.

Germany, and his public career seemed to be closed, but he quite unexpectedly received an invitation from the emperor of Austria to become his foreign minister. It was a bold decision, for Beust was not only a stranger to Austria, but also a Protestant; but the choice of the emperor fell on him, and he threw himself into his new position with great energy; it was owing to him that the negotiations with Hungary were brought to a successful issue. When difficulties came he went himself to Budapest, and acted directly with the Hungarian leaders. In 1876 he also held the position of Austrian minister-president, and he carried through the measures by which parliamentary government was restored. He also carried on the negotiations with the pope concerning the repeal of the concordat, and in this matter also did much by a liberal policy to relieve Austria from the pressure of institutions which had checked the development of the country. In 1868, after giving up his post as minister-president, he was appointed chancellor of the empire, and received the title of count. His conduct of foreign affairs, especially in the matter of the Balkan States and Crete, successfully maintained the position of the empire. In 1890 he accompanied the emperor on his expedition to the East. He was still to some extent influenced by the anti-Prussian feeling he had brought from Saxony. He maintained a close understanding with France, and there can be little doubt that he would have welcomed an opportunity in his new position of another struggle with his old rival Bismarck. In 1897, however, he helped to bring the affairs of Luxembourg to a peaceful terminus. In 1890 he did not disguise his sympathy for France, and the failure of all attempts to bring about an intervention of the powers, joined to the action of Russia in denouncing the treaty of Paris, was the occasion of his celebrated saying that he was nowhere able to find Europe. After the war was over he completely accepted the new organization of Germany.

As early as December 1870 he had opened a correspondence with Bismarck with a view to establishing a good understanding with Germany. Bismarck accepted his advances with alacrity, and the new entente, which Beust announced to the Austro-Hungarian delegations in July 1871, was sealed in August by a friendly meeting of the two old rivals and enemies at Gastein.

In 1871 Beust interfered at the last moment, together with Andrassy, to prevent the emperor accepting the federalist plans of Hohenwart. He was successful, but at the same time he was dismissed from office. The precise cause for this is not known, and no reason was given. At his own request he was appointed Austrian ambassador at London; in 1878 he was transferred to Paris; in 1882 he retired from public life. He died at his villa at Altwanger, near Breslau, on the 6th of October 1886, leaving two sons, both of whom entered the Austrian diplomatic service. His wife, a Bavarian lady, survived him only a few weeks. His elder brother Friedrich Konstantin (1806–1891), who was at the head of the Saxon department for mines, was the author of several works on mining and geology, a subject in which other members of the family had distinguished themselves.

Beust was in many ways a diplomatist of the old school. He had great social gifts and personal graces; he was proud of his proficiency in the lighter arts of composing waltzes and vers de société. His chief fault was vanity, but it was an amiable weakness. It was more vanity than rancour which made him glad to appear even in later years as the great opponent of Bismarck; and if he cared too much for popularity, and was very sensitive to neglect, the saying attributed to Bismarck, that if his vanity were taken away there would be nothing left, is very unjust. He was apt to look more to the form than the substance, and attached too much importance to the verbal victory of a well-written despatch; but when the opportunity was given him he showed a higher quality. In the crisis of 1840 he displayed considerable courage, and never lost his judgment even in personal danger. If he was defeated in his German policy, it must be remembered that Bismarck held all the good cards, and in 1866 Saxony was the only one of the smaller states which entered on the war with an army properly equipped and ready at the moment. That he was no mere reactionary the whole course of his government in Saxony, and still more in Austria, shows. His Austrian policy has been much criticized, but it is plain that in establishing the system of dualism he gave too much to Hungary, and did not really understand Austrian affairs; and the Austro-Hungarian crisis during the early years of the present century has given point to this view. Yet it remains the fact that in a crisis of extraordinary difficulty he carried to a successful conclusion a policy which, even if it was not the best imaginable, was the most desirable in the circumstances.

Beust was the author of reminiscences: Aus drei Viertel-Jahrhunderten (2 vols., Stuttgart, 1887; English trans. edited by Baron von Konstantin, 3 vols., fac-sims. of the original, London, 1888; also Konstantin von Beust, Erinnerungen (Leipzig, 1881), in answer to attacks made on him by his former colleague, Herr v. Frieser, in his reminiscences. See also Ebeling, F. F. Graf v. Beust (Leipzig, 1876), a full and careful account of his political career, especially up to 1866; Diplomatische Skizzen; No. 1. Count Beust by Outsider (Baron Carl v. Malortie); Fläche, Geschichte von Sachsen, vol. iii. (Gotha, 1877); Friesen, Erinnerungen aus meinem Leben (Dresden, 1880). (J. W. H.)

BEUTEN, or NIEDERBEUTEN, a town of Germany, in the north of Prussian Silesia, on the Oder, the capital of the mediatised principality of Carolath-Beuten. Pop. (1900) 3164. The chief industries of the place are straw-plaiting, building, and the manufacture of pottery; and a considerable traffic is carried on by means of the river. BEUTEN is a town of Germany, in the extreme south-east of Prussian Silesia, on the railway between Breslau and Cracow, 121 m. S.E. of the former. Pop. (1905) 60,078. It is the centre of the mining district of Upper Silesia, and its population is mainly engaged in such operations and in iron and zinc smelting. Beuthen is an old town, and was formerly the capital of the Bohemian duchy of Beuthen, which in 1620 was ultimately granted, as a free lordship of the Empire, to Lazarus, Baron Henckel von Donnersmark, by the emperor Ferdinand II., and parts of which, now mediatized, are held by two branches of the counts Hencikel von Donnersmark.

BEVEL (from an O. Fr. word, cf. mod. biveau, a joiner's instrument), the inclination of one surface of a solid body to another; also, any angle other than a right angle, and particularly, in joinery, the angle to which a piece of timber has to be cut. The mechanic's instrument known as a bevel consists of a rule with two arms so jointed as to be adjustable to any angle. In heraldry, a bevel is an angular break in a line. Bevelment, as a term of crystallography, means the replacement of an edge of a crystal by two planes equally inclined to the adjacent planes. As an architectural term "bevel" is a sloped or canted edge given to a sill or horizontal course of stone, but is more frequently applied to the canted edges worked round the projecting bands of masonry which for decorative purposes are employed on the quoins of walls or windows and in some cases, with vertical joints, cover the whole wall. When the outer face of the stone band is left rough so that it forms what is known as rusticated masonry, the description would be bevelled and rusticated. The term is sometimes applied to the spaying of the edges of a window on the outside, but the wide expansion made inside in order to admit more light is known as a splay.

BEVERLEY, WILLIAM ROXBY (1814–1888), English artist and scene-painter, was born at Richmond, Surrey, about 1814, the son of William Roxby, an actor-manager who had assumed the name of Beverley. His four brothers and his sister all entered the theatrical profession, and Beverley soon became both actor and scene-painter. In 1831 his father and his brothers took over the old Durham circuit, and he joined them to play heavy comedy for several seasons, besides painting scenery. His work was first seen in 1831 in London, for the pantomime Baron Munchausen at the Victoria theatre, which was being managed by his brother Henry. He was appointed scenic director for the Covent Garden opera in 1853. In 1854 he entered the service of the Drury Lane theatre under the management of E. T. Smith, and for thirty years continued to produce
wonderful scenes for the pantomimes, besides working for Covent Garden and a number of other theatres. In 1857 he executed part of a great diorama of Jerusalem and the Holy Land, and produced dioramic views of the ascent of Mont Blanc, exhibited at the Egyptian Hall, Piccadilly, and the Palace of Fine Arts, Chicago. In 1881 he constructed the diorama of the Lakes of Killarney. He was a frequent exhibitor of sea pictures at the Royal Academy from 1865 to 1880. In 1884 failing eyesight put an end to his painting. He died in comparative poverty at Hampstead on the 17th of May 1889. He was the last of the old school of one surface painters, and famed for the wonderful atmospheric effects he was able to produce. Although he was skilled in all the mechanical devices of the stage, and painted in 1881 scenery for Michael Strograb at the Adelphi, in which for the first time in England the still life of the stage was placed in harmony with the background, he was strongly opposed to the new school of scene-builders.

BEVERLEY, a market town and municipal borough in the Holderness parliamentary division of the East Riding of Yorkshire, England, 8 m. N.N.W. of Hull by a branch of the North-Eastern railway. Pop. (1901) 13,183. It lies in a level country east of the line of slight elevations known as the Wolds, near the river Hull, and has communication by canal with Hull. The church of St John the Evangelist, commonly called Beverley Minster, is a magnificent building, exceeding in size and splendour some of the English cathedrals. A monastery was founded here by John of Beverley (c. 640–712), a native of the Riding, who was bishop successively of Hexham and of York, and was canonized in 937. A college of secular canons followed in the 10th century, the provostship of which subsequently became an office of high dignity, and was held by Thomas Becket, afterwards archbishop of Canterbury. Of the existing building, the easternmost bay of the nave, the transepts with east and west aisles, the choir with aisles and short transepts, and the Lady chapel, are Early English, a superb example of the finest development of that style. The remainder of the nave is Decorated, excepting the westernmost bay which is Perpendicular, as is the ornate west front with its graceful flanking towers. The north porch is also a beautiful example of this style. The most noteworthy details within the church are the exquisite Early English staircases which led to the chapter house (no longer remaining), and the Percy tomb, a remarkable example of Decorated work, commemorating Eleanor, wife of Henry Percy (d. 1328). The church of St Mary is a cruciform building with central tower, almost entirely of Decorated and Perpendicular work. Though overshadowed by the presence of the minster, it is yet a very fine example of its style, its most noteworthy features being the tower and the west front. Beverley was walled, and one gate of the 15th century remains; there are also some picturesque houses; the town is a centre for tanning, iron-working, brewing and the manufacture of chemicals; and there is a large agricultural trade. Beverley is the seat of a suffragan bishop in the diocese of York. The municipal borough is under a mayor, 6 aldermen and 18 councillors, and has an area of 2,404 acres, including a large extent of common pasture land.

Beverley (Bevlerac) is said to be on the site of a British settlement. Evidently a church had existed there before 704, since in that year it was restored by St John of Beverley, who also founded a monastery there. In 1069 the town was granted to the bishop of York, who held it in the name of the king, but under his protection, and in 1212 it was taken by the Normans from the Normans. In 1285, when the town was under the protection of a new bishop, it was returned to the Normans.

BEVERLEY—BEVIS OF HAMPTON

BEVIS OF HAMPTON, the name of an English metrical romance. Bevis is the son of Guy, count of Hampton (Southampton) and his young wife, a daughter of the king of Scotland. The countess asks a former suitor, Doon or Devon, emperor of Almaine (Germany), to send an army to murder Guy in the forest. The plot is successful, and she marries Doon. When threatened with future vengeance by her ten-year-old son, she determines to make away with him also, but he is saved from death by a faithful tutor, is sold to heathen pirates, and reaches the court of King Hermin, whose realm is variously placed in Egypt and Armenia. The exploits of Bevis, his love for the king's daughter Josiane, his mission to King Bradmof of Damascus with a sealed letter demanding his own death, his
imprisonment, his final vengeance on his stepfather are related in detail. After succeeding to his inheritance he is, however, driven into exile and separated from Josiane, to whom he is reunited only after each of them has contracted, in form only, a second union. The story also relates the hero’s death and the fortunes of his two sons.

The oldest extant version appears to be Boevo de Haumtone, an Anglo-Norman text which dates from the first half of the 13th century. The English metrical romance, Sir Beues of Hamtoun, is founded on some French original varying slightly from those which have been preserved. The oldest Ms. dates from the beginning of the 14th century. The French chanson de geste, Boevo d’Hastune, was followed by numerous prose versions. The printed editions of the story were most numerous in Italy, where Boevo d’Antona was the subject of more than one poem, and the tale was interpolated in the Reali di Francia, the Italian compilation of Carolingian legend. Although the English version that we possess is based on a French original, it seems probable that the legend took shape on English soil in the 10th century, and that it originated with the Danish invaders. Doon may be identified with the emperor Otto the Great, who was the contemporary of the English king Edgar of the story. R. Zenker (Boevo-Amlethus, Berlin and Leipzig, 1904) establishes a close parallel between Bevis and the Hamlet legend as related by Saxo Grammaticus in the Historia Danica. Among the more obvious coincidences which point to a common source are the vengeance taken on a stepfather for a father’s death, the letter bearing his own death-warrant which is entrusted to the hero, and his double marriage. The motive of the feigned madness is, however, lacking in Bevis. The princess who is Josiane’s rival is less ferocious than the Hermuthrad of the Hamlet legend, but she threatens Bevis with death if he refuses her. Both seem to be modelled on the type of Thryddo of the Beowulf legend. A fanciful etymology connecting Bevis (Boevo) with Béowulf (Béwulf), on the ground that both were dragon-slayers, is inadmissible.

Bibliography.—The Romance of Sir Beues of Hamtoun, edited from six MSS. and the edition (without date) of Richard Pynson, by E. Kölling (Early Eng. Text Soc., 1885-1886-1894); A. Stimming, “Der anglo-normannische Boevo de Haumtone,” in H. Sichler’s Bibl. Norm. vol. vii. (Halle, 1899); the Welsh version, with a translation by E. B. Lewis, Seithlins, second ed. (London, 1892); the old Norse version by G. Cederlöf, Forntider Sverirdana (Lund, 1884); A. Wesselsky, “Zum russischen Bovo d’Antonsa” (in Archiv für slav. Phil. vol. viii., 1885); for the earliest printed edition, with a French Romance of the same name see G. Brunet, Manuel du libraire, s.w. Bevis, Beufes and Buovo.

Bewdley.—a market town and municipal borough in the Bewdley parliamentary division of Worcestershire, England; 137 m. N.W. by W. from London and 14½ N. by W. from Worcester by rail. Pop. (1901) 2866. The Worcester–Shrewsbury line of the Great Western is here joined by lines east from Birmingham and west from Tenbury. Bewdley is pleasantly situated on the sloping right bank of the Severn, on the eastern border of the forest of Wyre. A bridge by Telford (1797) crosses the river. A free grammar school, founded in 1591, was re-founded by James I. in 1606, and possesses a large library bequeathed in 1812. The town manufactures combs and horn goods, brass and iron wares, leather, malt, bricks and ropes. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 2105 acres.

Bewdley (i.e. Beaulieu) is probably referred to in the Domesday survey as Bealei and Bealeford, and was the manor, then called Bellius Locus or Beaulieu on account of its beautiful situation, was afterwards granted to the Mortimers, in whose family it continued until it was merged in the crown on the accession of Edward II. It was not until this time that Bewdley dates its importance. Through its situation on the Severn it was connected with the sea, and in 1250 a bridge, the only one between it and Worcester, was built across the river and added greatly to the commerce of the town. From Edward IV. Bewdley received its charter in 1472, and there appears to be no evidence that it was a borough before this time. Other charters were granted in 1605, 1685 and 1708. By James I.’s charter the burgesses sent one member to parliament, and continued to do so until 1885. A fair and a market on Wednesday were granted by Edward III. and in 1708, by Henry VI. Edward IV. also granted the burgesses a market on Saturdays, and three fairs, which were confirmed to them by Henry VII. Coal-mines were worked in Bewdley as early as 1699, and the town was formerly noted for making caps.

BEWICK, THOMAS (1753-1828), English wood-engraver, was born at Cherryburn, near Newcastle-on-Tyne, in August 1753. His father rented a small colliery at Mickleybank, and sent his son to school at Mickley. He proved a poor scholar, but showed, at a very early age, a remarkable talent for drawing. He had no tuition in the art, and no models save natural objects. At the age of fourteen he was apprenticed to Mr Beilby, an engraver in Newcastle. In his office Bewick engraved on wood for Dr Hutton a series of diagrams illustrating a treatise on mensuration. He seems thereafter to have devoted himself entirely to engraving on wood, and in 1775 he received a premium from the Society for the Encouragement of Arts and Manufactures for a woodcut of the Huntsman and the Old Hound. In 1784 appeared his Select Fables, the engravings in which, though far more polished, were believed by some to have been made by an assistant superior to anything that had yet been done in that line. The Quadrupeds appeared in 1790, and his great achievement, that with which his name is inseparably associated, The British Birds, was published from 1797 to 1804. Bewick, from his intimate knowledge of the habits of animals acquired during his constant excursions into the country, was thoroughly qualified to do justice to his great task. Of his other productions the engravings for Goldsmith’s Traveller and Deserted Village, for Parnell’s Hermit, for Somerville’s Chase, and for the collection of Fables of Aesop and Others, may be specially mentioned. Bewick was for many years in partnership with his former master, and in later life had numerous pupils, several of whom gained distinction as engravers. He died on the 8th of November 1828.

His autobiography, Memoirs of Thomas Bewick, by himself, appeared in 1862.

BEXHILL, a municipal borough and watering-place in the Rye parliamentary division of Sussex, England, 62 m. S.E. by S. from London, on the London, Brighton & South Coast, and the South-Eastern & Chatham railways. Pop. (1891) 2506; (1901) 12,213. The ancient village, with the Norman and Early English church of St Peter, lies inland on the slope of the low hills fringing the coast, but the watering-place on the shore has developed very rapidly since about 1884, owing to the exertions of Earl De la Warr, who owns most of the property. It has a marine parade, pier, golf links, and the usual appointments of a seaside resort, while the climate is bracing and the neighbouring country pleasant. Bexhill was incorporated in 1902, the corporation consisting of a mayor, 6 aldermen and 18 councillors. Area, 8013 acres.

BEXLEY, NICHOLAS VANSITTART, BARON (1766-1851), English politician, was the fifth son of Henry Vansittart (d. 1770), governor of Bengal, and was born in London on the 29th of April 1784. Educated in Chichester Church, Oxford, he entered Lincoln’s Inn in 1787, and was called to the bar at Lincoln’s Inn in 1791. He began his public career by writing pamphlets in defence of the administration of William Pitt, especially on its financial side, and in May 1796 became member of parliament for Hastings, retaining his seat until July 1802, when he was returned for Old Sarum. In February 1801 he was sent on a diplomatic errand to Copenhagen, and shortly after his return was appointed joint secretary to the treasury, a position which he retained until the resignation of Addington’s ministry in April 1804. Owing to the influence of his friend, Ernest, duke of Cumberland, he became secretary for Ireland under Pitt in January 1805, resigning his office in the following September. With Addington, now Viscount Sidmouth, he joined the government of Fox and Grenville as secretary to the treasury in February 1806, leaving office with Sidmouth just before the fall of the ministry in March
1807. During these and the next few years Vansittart's reputation as a financier was gradually rising. In 1809 he proposed and carried without opposition in the House of Commons thirty-eight resolutions on financial questions, and only his loyalty to Sidmouth prevented him from joining the cabinet of Spencer Perceval as chancellor of the exchequer in October 1809. He opposed an early resumption of cash payments in 1811, and became chancellor of the exchequer when the Earl of Liverpool succeeded Perceval in May 1812. Having forsaken Old Sarum, he had represented Helston from November 1806 to June 1812; and after being member for East Grinstead for a few weeks, was returned for Harwich in October 1812.

When Vansittart became chancellor of the exchequer the country was burdened with heavy taxation and an enormous debt. Nevertheless, the continuance of the war compelled him to increase the custom duties and other taxes, and in 1813 he introduced a complicated scheme for dealing with the sinking fund. In 1816, after the conclusion of peace, a large decrease in taxation was generally desired, and there was a loud outcry when the chancellor proposed only to reduce, not to abolish, the property or income tax. The abolition of this tax, however, was a measure totally opposed to Vansittart, and Vansittart became very unpopular in the country, and he resigned his office in December 1812. His system of finance was severely criticized by Huskisson, Tierney, Brougham, Hume and Ricardo. On his resignation Liverpool offered Vansittart the post of chancellor of the duchy of Lancaster. Accepting this offer in February 1812, he was created Baron Bexley in March, and granted a pension of £3000 a year. He resigned in January 1818. In the House of Lords Bexley took very little part in public business, although he introduced the Spitalfields weavers bill in 1813, and voted for the removal of Roman Catholic disabilities in 1822. He took a good deal of interest in the British and Foreign Bible Mission, the Church Missionary Society and kindred bodies, and assisted to found King's College, London. He died at Foot's Cray, Kent, on the 8th of February 1831. His wife, whom he married in July 1806, was Isabella (d. 1810), daughter of William Eden, 1st Baron Auckland, and as he had no issue the title became extinct on his death. There are nine volumes of Vansittart's papers in the British Museum.

**BEXLEY**, an urban district in the Dartford parliamentary division of Kent, England, 12 m. S.E. by E. of London by the South-Eastern & Chatham railway. Pop. (1901) 12,918. Bexley, which is mentioned in Domesday Book, has had a church since the 9th century. The present church of St Mary is Early English and later. With the rental of the manor of Bexley, William Camden, the antiquary, founded the ancient history professorship at Oxford. Hall Place, which contains a fine Jacobean staircase and oak-panelled hall, is said to occupy the site of the dwelling-place of the Black Prince. The course of Watling Street may be traced over Bexley Heath, where, too, there exist deep pits, widening into vaults below, and probably of British origin.

**BEY** (a modern Turk. word, the older form being beg, cf. Pers. baig), the administrator of a district, now generally an honorific title throughout the Turkish empire; the granting of this in Egypt is made by the sultan of Turkey through the khedive. In Tunis "be" has become the hereditary title of the reigning sovereigns (see TUNISIA).

**BEYBAZAR**, the chief town of a kasa of the Angora vilayet in Asiatic Turkey, situated on an affluent of the Sakaria (anc. Sangorius), about 52 m. W. of Angora. It corresponds to the

Inc. Lagania, renamed Anastasiopolis under the emperor Anastasius (491–518), a bishopric by the 5th century. Its well-built wooden houses cover the slopes of three hills at the mouth of a gorge filled with fruit gardens and vineyards. The chief products are rice, cotton and fruits. From Beybazar come the fine pears sold in Constantinople as "Angora pears"; its muskmelons are equally esteemed; its grapes are used only for a sweetmeat called *jerdal-sujuk* ("nutty fruit sausage"). There are few remains of antiquity apart from numerous rock-cut chambers lining the banks of the stream. Pop. about 4000 to 5000.

**BEYLE, MARIE HENRI** (1783–1842), better known by his nom de plume of STENDHAL, French author, was born at Grenoble on the 23rd of January 1783. With his father, who was an avocat in the parlement of Grenoble, he was never on good terms, but his intractable disposition sufficiently explains his unhappy childhood and youth. Until he was twelve years old he was educated by a priest, who succeeded in inspiring him with a lasting hatred of clericalism. He was then sent to the newly established École Centrale at Grenoble, and in 1799 to Paris with a letter of introduction to the Daru family, with which the Beyle were connected. Pierre Daru, however, was at that time minister for war, and with the brothers Daru he followed Napoleon to Italy. Most of his time in Italy was spent at Milan, a city for which he conceived a lasting attachment. Much of his *Charnière de Parme* seems to be autobiographical of this part of his life.

He was a spectator of the battle of Marengo, and afterwards enlisted in a dragoon regiment. With rapid promotion he became adjutant to General Michaud; but after the peace of Amiens in 1802 he returned to study in Paris. There he met an actress, Mélanie Guilbert, whom he followed to Marseilles. His father cut off his supplies on hearing of this escapade, and Beyle was reduced to serving as clerk to a grocer. Mélanie Guilbert, however, soon abandoned him to marry a Russian, and Beyle returned to Paris. Through the influence of Daru he obtained a place in the commissariat, which he filled with some distinction from 1806 to 1814. Charged with raising a levy in Brunswick of five million francs, he extracted seven; and during the retreat from Moscow he discharged his duties with efficiency. On the fall of Napoleon he was for a time under the new régime, and retired to Milan, where he met Silvio Pellico, Manzoni, Lord Byron and other men of note. At Milan he contracted a liaison with a certain Angelina P., whom he had admired fruitlessly during his earlier residence in that city. In 1814 he published, under the pseudonym of Alexandre César Bombet, his *Lettres érotiques de Vienne en Autriche sur le célèbre compositeur, Joseph Haydn, suivies d'une vie de Mozart, et de considérations sur Méthastase et l'état présent de la musique en Italie*. His letters on Haydn were borrowed from the Haydini (1812) of Joseph Carpani, and the section on Mozart had no greater claim to originality. The book was reprinted (1817) as *Vies de Haydn, Mozart et Méthastase*. *Son Histoire de la peinture en Italie* (2 vols., 1817) was originally dedicated to Napoleon.

His friendship with some Italian patriots brought him in 1821 under the notice of the Austrian authorities, and he was exiled from Milan. In Paris he felt himself a stranger, as he had never recognized French contemporary art in literature, music or painting. He frequented, however, "many literary salons in Paris", and "had some friends in the "idéologues" who gathered Round Destutt de Tracy. He was the most closely allied with Prosper Mérimée, a dilettante and an ironist like himself. He published at this time his *Essai sur l'amour* (1822), of which only seventeen copies were sold in eleven years, though it afterwards became famous, *Rocine et Shakespeare* (1823–1825), *Vie de Rossini* (1824), *D'un nouveau complot contre les industriels* (1825), *Promenades dans Rome* (1826), and his first novel, *Armance, ou quelque scènes de Paris* in 1827 (1827). After the Revolution of 1830 he was appointed consul at Trieste, but the Austrian government refused to accept him, and he was sent to Civita Vecchia instead. *Le Rouge et le noir, chronique du XIXe siècle* (2 vols., 1830) appeared in Paris after his departure, but attracted
small notice. He had published in 1838 Mémoires d'un touriste, and in 1839 La Chartreuse de Parme (2 vols.), which was the last of his publications, and the first to secure any popular success, though his earlier writings had been regarded as significant by a limited public. It was enthusiastically reviewed by Balzac in his Revue Parisienne (1840). Beyle remained at Civita Vecchia, discharging his duties as consul perfunctorily and with frequent intervals of absence until his death, which took place in Paris on the 23rd of March 1842. He wrote his own epitaph, describing himself as a Milanese.

Beyle's posthumous works include a fragmentary Vie de Napoléon (1875); Mélanges d'art et de littérature (1867); Chroniques italiennes (1883), including "L'Abbesse de Castro," "Les Cenci," "Vittoria Accoramboni," "Vanina Vanini," "La Duchesse de Paltiano," some of which has appeared separately; Romans et nouvelles et Nouvelles inédites (1855); Correspondance (2 vols., 1855); Lamiel (ed. C. Streyiens, 1889); his Journal 1801-1854 (ed. Streyiens and F. de Nion, 1888), of which the section dealing with the Russian and German campaigns is unfortunately lost; Vie de Henri Brulard (1860), a disguised autobiography, chiefly the history of his numerous love affairs; Lettres intimes (1892); Lucca di Camerino (1895); and Souvenirs d'égoïsme (ed. C. Streyiens, 1892), autobiography and unpublished letters.

Stendhal's reputation practically rests on the two novels Le Rouge et le noir and La Chartreuse de Parme. In the former of these he borrowed his plot from events which had actually happened some years previously. Julien Sorel in the novel is tutor in a noble family and seduces his pupil's mother. He eventually kills her to avenge a letter accusing him to the family of his betrothed, Mille de la Mole. Julien is a picture of Beyle as he imagined himself to be. The Chartreuse de Parme has less unity of purpose than Le Rouge et le noir. For its setting the author drew largely on his own experiences. Fabrice's experiences at Waterloo are his own in the Italian campaign, and the countess Pietranera is his Milanese Angelina. But of the two novels it is more picturesque and has been more popular. Stendhal's real vogue dates from the early sixties, but his importance is essentially literary. In spite of his egoism and the limitations of his ideas, his acute analysis of the motives of his personages has appealed to successive generations of writers, and a great part of the development of the novel up to the present day may be traced to him. Brunetière has pointed out (Manual of French Lit., Eng. trans., 1898) that Stendhal supplied the Romanticists with the notion of the interchange of the methods and effects of painting, poetry, and music, and that in his worship of Napoleon he agreed with their glorification of individual energy. Stendhal, however, thoroughly disliked the Romanticists, though Sainte-Beuve acknowledged (Causiers du lundi, vol. ix) that his books gave ideas. Taine (Essais de critique et d'histoire, 1857) found in him a great psychologist; Zola (Romanciers naturalistes, 1881) actually claimed him as the father of the naturalistic school; and Paul Bourget (Essais de psychologie contemporaine, 1883) cited Le Rouge et le noir as one of the classic novels of analysis.

Of the 1846 edition of La Chartreuse de Parme contains a prefatory notice by R. Colom, and a reprint of Balzac's article. In addition to the correspondence (1855) between Beyle and Prosper Mérimée, A. A. Paton, Henry Beyle, a Critical and Biographical Study (1874); Adolphe Paupe, Histoire des œuvres de Stendhal (1903); A. Chiquet, Stendhal-Beyle (1902); a review by R. Doumis (Revue des deux mondes, February 1902) deprecating the excessive attention paid to Beyle's writings; and Edouard Rod, Stendhal (1892) in the "Grands écrivains français" series. See also Correspondance de Stendhal, 1800-1842, with preface by M. Barrès (Paris, 1908).

BEYRICHT, HEBRICH ERNST VON (1815-1869), German geologist, was born at Berlin on the 31st of August 1815, and educated at the university in that city, and afterwards at Bonn, where he studied under Goldfuss and Nögerath. He obtained his degree of Ph.D. in 1837 at Berlin, and was subsequently employed in the mineralogical museum of the university, becoming director of the palaeontological collection in 1857, and director of the museum in 1875. He was one of the founders of the German Geological Society in 1848. He early recognized the value of palaeontology in stratigraphical work; and he made important researches in the Rheno-Rhenish mountains, in the Harz and Alps districts. In later years he gave special attention to the tertiary strata, including the brown coal of North Germany. In 1854 he proposed the term Oligocene for certain tertiary strata intermediate between the Eocene and Miocene; and the term is now generally adopted. In 1865 he was appointed professor of geology and palaeontology in the Berlin University, where he was eminently successful as a teacher; and when the Prussian Geological Survey was instituted in 1873 he was appointed co-director with Wilhelm Hauchecorne (1828-1900). He published Beiträge zur Kenntniss der Versteuerungen des rheinischen Übergangsgebirges (1837); Uber einige böhmisiche Tribolitien (1845); Die Conchylien des norddeutschen Tertiärgebirges (1853-1857). He died on the 9th of July 1866.

BEY SCHLAG, WILLIBALD (1823-1900), German Protestant divine, was born at Frankfort-on-Main on the 5th of September 1823. He studied theology at Bonn and Berlin (1849-1844), and in 1856 was appointed court-preacher at Karlsruhe. In 1864 he was named to Halle as professor ordinarius of practical theology. A theologian of the mediatorial school, he was leader of the Mittelpartei, and with Albrecht Wolters founded as its organ the Deutsches evangelische Blätter. As a representative of this party, he took a prominent part in the general synods of 1875 and 1876. His championship of the rights of the laity and his belief in the autonomy of the church led him to advocate the separation of church and state. He died at Halle on the 25th of March 1900. Among his numerous works are Die Christologie des Neuen Testaments (1866), Der Altkatholicismus (three editions, 1876-1883), Leben Jesu (2 vols., 1885, 3rd ed., 1893), Neutestamentliche Theologie (2 vols., 1891-1892; 2nd ed., 1896), Christenlehre auf Grund des kleinen luth. Katechismus (1900), and an autobiography Aus meinem Leben (2 parts, 1896-1898).

BEZA (DE BÈZE), THEODORE (1519-1605), French theologian, son of bailli Pierre de Beze, was born at Vezelay, Burgundy, on the 24th of June 1519. Of good descent, his parents were known for generous piety. He owed his education to an uncle, Nicolas Béza, a noted jurist and law professor, who placed him (1529) under Melchior Wolmar. In 1539 he was later at Bourges, Wolmar, who had taught Greek to Calvin, grounded Beza in Scripture from a Protestant standpoint; after his return to Germany (1534) Beza studied law at Orleans (May 1535 to August 1539), beginning practice in Paris (1539) as law licentiate. To this period belong his exercises in Latin verse, in the loose taste of the day, foolishly published by him as Juvenilia in 1548. Though not in orders, he held two benefices. A severe illness wrought a change; he married his mistress, Claude Desnoz, and joined the church of Calvin at Geneva (October 1548). In November 1549 he was appointed Greek professor at Lausanne, where he acted as Calvin's adjuvant in various publications, including his defence of the burning of Servetus, De Haereticis a civilis magistratur puniendis (1554). In 1558 he became professor in the Geneva academy, where his career was brilliant. His conspicous ability was shown in the abortive Colloquy of Poissy (1561). On Calvin's death (1564) he became his biographer and administrative successor. As a historian, Beza, by his chronic and judicial method, was the source of serious mistakes; as an administrator, he softened the rigour of Calvin. His editions and Latin versions of the New Testament had a marked influence on the English versions of Geneva (1557 and 1560) and London (1611). The famous codex D. was presented by him (1581) to Cambridge University, with a characteristically dubious account of the history of the manuscript. His works are very numerous, but of little moment, except those already mentioned. He resigned his offices in 1600, and died on the 15th of October 1605. He had taken a second wife (1588), Catherine del Piano, a widow, but left no issue. He was not the author of the Histoire ecclésiastique (1586), sometimes ascribed
to him; nor, probably, of the vulgar skit published under the name of Benedict Pananvantius (1531).

See Laingaeus, De Vita et Mortibus (1585, calumnious); Antoine la Faye, De Vita et Vita (1860, eulogistic); Schlosser, Leben (1860); Baum, Th. Best, portrait (1843–1851); Hepple, Leben (1861).

BEZANT or BYZANT (from Byzantium, the modern Constanti-nople), originally a Byzantine gold coin which had a wide circulation throughout Europe up to about 1250. Its average value was about nine shillings. Bezs were also issued in Flanders and Spain. Silver bezants, in value from one to two shillings, were in circulation in England in the 13th and 14th centuries.

Bezs were represented by gold circles on the shield, and were introduced by the crusaders.

BEZANTÉE, in architecture, a name given to an ornamented moulding much used in the Norman period, resembling the coins (bezants) struck in Byzantium.

BEZBORODKO, ALEKSANDER ANDREEVICH, prince (1747–1799), grand chancellor of Russia, was born at Gluchova on the 14th of March 1747, and educated at home and in the clerical academy at Kiev. He entered the public service as a clerk in the office of Count P. A. Rumyantsev, then governor-general of Little Russia, whom he accompanied to the Turkish War in 1768. He was present at the engagements of Larga and Kaluga, and at the storming of Siliistra. On the conclusion of the peace of Kuchuk-Kainarji (1774) the field marshal recommended him to Catharine II., and she appointed him in 1775 her petition-secretary. He thus had the opportunity of impressing the empress with his brilliant gifts, the most remarkable of which were exquisite manners, a marvellous memory, and a clear and pregnant style. At the same time he set to work to acquire the principal European languages, especially French, of which he became a master. It was at this time that he wrote his historical sketches of the Tatar wars and of Little Russia.

His activity was prodigious, and Catharine called him her factotum. In 1780 he accompanied her on her journey through White Russia, meeting the emperor Joseph, who urged him to study diplomacy. On his return from a delicate mission to Copen-hagen, he presented to the empress “a memorial on political affairs” which comprised the first plan of a partition of Turkey between Russia and Austria. This document was transmitted almost word for word to Vienna as the Russian proposals. He followed this up by Epitomized Historical Information concerning Moldavia. For these two state papers he was rewarded with the posts of “plenipotentiary for all negotiations” in the foreign office and postmaster-general. From this time he was inseparably associated with Catharine in all important diplomatic affairs, though officially he was the subordinate of the vice-chancellor, Count Alexander Osterman. He wrote all the most important despairs to the Russian ministers abroad, concluded and subscribed all treaties, and performed all the functions of a secretary of state. He identified himself entirely with Catharine’s political ideas, even with that of re-establishing the Greek empire under her grandson Constantine.

The empress, as usual, richly rewarded her comes with pensions and principalities. In 1786 he was promoted to the senate, and it was through him that the empress communicated her will to that august state-decor. In 1787 he accompanied Catharine on her triumphal progress through South Russia in the capacity of minister of foreign affairs. At Kaniev he conducted the negotiations with the Polish king, Stanislaus II., and it seems as if he was in the empress’s carriage when she received Joseph II.

The second Turkish War (1787–92) and the war with Gustavus III. (1788–90) heaped fresh burdens on his already heavily laden shoulders, and he suffered from the intrigues of his numerous jealous rivals, including the empress’s latest favourite, A. M. Mamonov. All his efforts were directed towards the conclusion of the two oppressive wars by an honourable peace. The peace of Verelà with Gustavus III. (14th of August 1790) was on the terms dictated by him. On the sudden death of Potemkin he was despatched to Jassy to prevent the peace congress from breaking up, and succeeded in the face of all but insuperable difficulties, in concluding a treaty exceedingly advantageous to Russia (6th of September 1793). For this service he received the thanks of the empress, the ribbon of St Andrew and 50,000 roubles. On his return from Jassy, however, he found his confidential post of secretary of petitions occupied by the empress’s last favourite, P. A. Zubov. He complained of this “diminution of his dignity” to the empress in a private memorial in the course of 1793. The empress reassured him by fresh honours and distinctions on the occasion of the solemn celebration of the peace of Jassy (2nd of September 1793), when she publicly presented him with a golden olive-branch encrusted with brilliants. Subsequently Catharine reconciled him with Zubov, and he resumed the conduct of foreign affairs. He contributed more than any other man to bring about the downfall and the third partition of Poland, for which he was magnificently recompensed. But diplomacy by no means exhausted Bezborodko’s capacity for work. He had a large share in the internal administration also. He reformed the post-office, improved the banking system of Russia, regulated the finances, constructed roads, and united the Uniate and Orthodox churches.

On the death of Catharine, the emperor Paul entrusted Bezborodko with the examination of the late empress’s private papers, and shortly afterwards made him a prince of the Russian empire, with a correspondingly splendid apanage. On the retirement of Osterman he received the highest dignity in the Russian empire—that of imperial chancellor. Bezborodko was the only Russian minister who retained the favour of Paul to the last. During the last two years of his life the control of Russia’s diplomacy was entirely in his hands. His programme at this period was peace with all the European powers, revolutionary France included. But the emperor’s growing aversion from this pacific policy induced the astute old minister to attempt to “seek safety in moral and physical repos.” Paul, however, refused to accept his resignation and would have sent him abroad for the benefit of his health, had not a sudden stroke of paralysis prevented Bezborodko from taking advantage of his master’s kindness. He died at St Petersburg on the 6th of April 1799. In private life Bezborodko was a typical Catharinian, corrupt, licentious, conscienceless and self-seeking. But he was infinitely generous and affectionate, and spent his enormous fortune liberally. His banquets were magnificent, his collections of pictures and statues unique in Europe. He was the best friend of his innumerable poor relatives, and the Maecenas of all the struggling authors of his day. Sympathetic he might have been, but he was neither ungrateful nor vindictive. His patriotism is as indisputable as his genius.

See Sbornik (Collections) of the Imperial Russian Historical Society (Fr. and Russ.), vols. 60–100 (St Petersburg, 1870–1904); Nikolai Ivanovich Grigorovich, The Chancellor A. A. Bezborodko in Connection with the Events of His Time (Russ., St Petersburg, 1879–1881). (K. N. B.)

BEZEL (from an O. Fr. word, cf. Mod. Fr. biseau, basile, possibly connected with Lat. bis, twice), a sloping edge, as of a cutting tool, also known as basil. In jewelry, the term is used for the oblique sides or faces of a gem; the rim which secures the crystal of a watch in position or a jewel in its setting, and particularly the enlarged part of a ring on which the device is engraved (see RING).

BÉZIERS, a town of southern France, capital of an arrondisment in the department of Hérault, 47 m. S.W. of Montpellier; 525 ft. above sea-level, situated in a wine-growing district on a hill on the left bank of the river Orb, which is joined at this point by the Canal du Midi. The Allées Paul Riquet, named after the creator of the canal, occupy the centre of Béziers and divide the old town with its maze of narrow and irregular streets from the new quarter to the east. They form a long and shady promenade, terminating at one end in the Place de la République and the theatre, the front of which is decorated with bas-reliefs by David d’Angers,
and at the other in a beautiful park, the Plateau des Poëtes.

The most interesting portion of the town is the extreme west where the old ramparts overlook the Orb. Above them towers St. Nazaire, the finest of the churches of Béziers; it dates from the 12th to the 14th centuries and is a good specimen of the ecclesiastical fortification common in southern France. Its chief artistic features are the rose window in the western façade, and the stained glass and curious iron grilles of the choir-windows, which belong to the 14th century. Adjoining the south transept there are Gothic cloisters of the 14th century. The Orb is crossed by four bridges, the railway bridge, an ancient bridge of the 13th or 14th century, a modern bridge and the fine aqueduct by which the Canal du Midi is carried over the river. About half a mile to the south-west of the town are the locks of Fonserannes, in which 330 yds. the water of the canal descends 80 ft. to reach the level of the Orb. There are remains of a Roman arena which have been built into the houses of the rue St. Jacques. Béziers is seat of a sub-prefecture and has tribunals of first instance and of commerce, communal colleges and several learned societies.

It is an agricultural market and carries on an active trade in wine, brandy, fruit, leather and sulphur. Its industries are chiefly connected with the wine trade (cask and cork making, &c.), and there are important distilleries. It also has iron-wor
crafts and tanneries.

The Romans established a colony at Béziers, and it was the headquarters of the seventh legion, under the title of Baeterrae Septimanaorum. The present name occurs in the form Besara as early as Festus Avienus (later 4th century). The town was completely destroyed in 1229 by the forces of Simon de Montfort in the crusade against the Albigensians, on which occasion 20,000 persons were massacred. The walls were rebuilt in 1289; but the town again suffered severely in the civil and religious wars of the 16th century, and all its fortifications were destroyed in 1632.

BÉZIQUE (probably from Span. besite, little kiss, in allusion to the meeting of the queen and knave, an important feature in the game), a game at cards played with two similar packs from which the twos, threes, fours, fives and sixes have been rejected, shuffled together and used as one. It is modelled on a group of card games which possess many features in common; the oldest of these is mariage, then follow brisquemblle, l'homme de brou, briscan or brisque, and cinq-cents. Bézique (also called besi and besigue) is, in fact, brisque played with a double pack, and with certain modifications rendered necessary by the introduction of additional cards. The cards rank as follows:—Ace, ten, king, queen, knave, nine, eight, seven.

The usual game is for two players. The players cut for deal, and the higher bézique card deals. The objects of the play are: (1) to promote in the hand various combinations of cards, which, when declared, entitle the holder to certain scores; (2) to win aces and tens, known as "brisques"; (3) to win the so-called last trick. The dealer deals eight cards to each, first three, then two, and again three. The top card of those remaining (called the "stock" ) is turned up for trumps. As sometimes played, the first trick, or the first sequence, decides the trump suit; there is then no score for the rest of tricks (see below). The stock is placed face downwards between the players and slightly spread. The non-dealer leads any card, and the dealer plays to it, but need not follow suit, nor win the trick. If he wins the trick by playing a higher card of the same suit led, or a trump, the lead fails to him. In case of ties the leader wins. Whoever wins the trick leads to the next; but before playing again each player takes a card from the stock and adds it to his hand, the winner of the trick taking the top card. This alternate playing and drawing a card continues until the stock (including the trump card or card exchanged for it, which is taken up last) is exhausted. The tricks remain face upwards on the table, but must not be searched during the play of the hand.

The scores are shown as follows:—

| Marriage (king and queen of any suit) | Royal marriage (king and queen of trumps) | Bézique (queen of spades and knave of diamonds) | Double bézique (all the four bézique cards) | Four aces (any four, whether duplicates or not) | Four kings (any four) | Four queens (any four) | Four knaves (any four) | Aces and tens, in tricks, the winner for each one mark.

Last trick of all (as sometimes played, the last trick before the stock is exhausted) the winner marks 10

A "declaration" can only be made by the winner of a trick immediately after he has won it, and before he draws from the stock. It is effected by placing the declared cards (one of which at least must not have been declared before) face upwards on the table, where they are left, unless they are played, as they may be. A player is not bound to declare. A card led or played cannot be declared. More than one declaration may be made at a time, provided no card of one combination forms part of another that is declared with it. Thus four knaves and a marriage may be declared at the same time; but a player cannot declare king and queen of spades and knave of diamonds together to score marriage and bézique. He must first declare one combination, say bézique; and when he wins another trick he can score marriage, then declaring the king, declare not to be a top card, then read just been declared. If, then, four knaves (one a bézique knave) and four queens (one a bézique queen) have been declared, the knave and queen already declared cannot be declared again as bézique. To score all the combinations with these cards, after the knaves are declared and another trick won, bézique must next be made, after which, on winning another trick, the three queens can be added and four queens scored. Lastly, a card once declared can only be used again in declaring in combinations of a different class. For example: the bézique queen can be declared in bézique, marriage and four queens; but having once been declared in single bézique, she cannot form part of another single bézique. Two declarations may, in a sense, be made to a trick, but only one can be scored at the time. Thus with four kings declared, including the king of spades, bézique can be declared and scored, but the spade marriage cannot be scored till the holder wins another trick. The correct formulæ is "Forty, and forty more." The seven of trumps may be either declared or exchanged for the turn-up after winning a trick, and before drawing. When exchanged, the turn-up is taken into the player's hand, and the seven put in its place. The second seven can, of course, be declared. A seven when declared is not left on the table, but is simply shown.

The winner of the last trick can declare anything hitherto undeclared in his hand. After this all declarations cease. The winner of the last trick takes the last card of the stock, and the loser the turn-up card (or seven exchanged for it). All cards on the table, that have been declared and not played, are taken up by their owners. The last eight tricks are then played, but the second player must follow suit if able, and must win the trick if able. Finally, each player counts his tricks for the aces and tens they may contain, unless (as is often done) they are scored at the time. If a player revokes in the last eight tricks, or does not win the card led, if able, the last eight tricks belong to his adversary. The deal then passes on alternately until the game (1000) is won. If the loser does not make 500, his opponent counts a double game, or double points, according as they have agreed. The score is best kept by means of a special bézique marker.

Three- and Four-Handed Bézique.—When three play, three packs are used together. All play against each other. The player on the left of the dealer is first dealt to and has the first lead. The rotation of dealing goes to the left. If double bézique has been scored, and one pair has been played, a second double bézique may be made with the third pair and the pair on the table. Triple bézique scores 500. All the cards of the triple bézique must be on the table at the same time and unemployed to a trick. All may be declared together, or a double bézique may be added to a single one, or a third bézique may be added to a double bézique already declared. The game is 2000

up. Sometimes the three players cut, the one who cuts the highest card plays against the other two in consultation, and continues to do so till the allies win a game, when the two cut as before to see who shall be the single player. Only two packs are then used.

When four play, four packs are used. The player who then score the highest card of a set of tricks are played, a card, double bôizique or triple bôizique may be scored as before; to form the bôiziques may be declared from the hand of either partner. A player may declare: when he or his partner makes a trick. In playing the last eights, nine, and ten, may be used, the tricks are taken from the player who left their cards against each other, and then the other two similarly play theirs. Four people may also play in pairs by consultation, only two packs being then required.

Bôizique and its four varieties (Modern, Russian, „Feldiski” and „Fildiski”) differs from ordinary bôizique in the following particulars. The game is not less than 2000 up. Whenever a scoring card is played, the winner of the trick places it face upwards in front of him (the same with a card four eights, nines, and ten), declaring to his partner and to his opponent his declaration. Sometimes of bezique four tricks, against the grand of eight, kings, queens, and knaves and trump tens (called open cards). Cards of the same denomination are placed overlapping one another lengthwise from the player towards his adversary to economise space. When a scoring card is placed as before, the open cards in the seven, eight, nine, and ten, plain suit tens in the tricks are turned down and put on one side. Open cards cannot be played a second time, and can only be used in declaring. Whether or not they remain face upwards on the table until the end of the hand. A dealer who continues a trick after winning a trick and before drawing again, when the trick won contains a card or cards included in the open cards complete any combination that scores. Every declaration must include a card played in addition, and is to be put face downwards in the open cards as won, and not at the end of the hand. There are seven of the tricks may be exchanged by the winner of the trick containing it; and if the turn-up card is one that can be used in declaring, it becomes an open card whereby the player wins them. When a trick is exchanged is scored for by the player winning the trick containing it.

Compound declarations are allowed, i.e. cards added to the open cards can be declared, without waiting to win another trick, in as many tricks as there are cards, other than the trick taken by the other player's open cards. For example: A has three open kings, and he wins a trick containing a king. Before drawing again he places the fourth king with the other three, and scores 50 for kings. This is scored by A. He also scores 40 points by the quadruple of the two cards, 40 by the quadruple of the three cards, 40 by the quadruple of the four cards, and 40 by the quadruple of the five cards. A wins the trick with the king and has the following open cards—three kings, three queens, and ace, ten, knave of trumps. He at once declares royal marriage (40); four kings (80); four queens (60); and sequence (250); and scores 430. A ace, four, eight, and ten, are heads led. The second player has two open aces, and wins the ace of hearts with the seven of trumps and exchanges. He scores for the exchange, 10; for the ace of hearts, 10; for the ace of spades, 10; and adds the aces to his score, 30. He must therefore declare, or part of a compound declaration is omitted, and the winner of the trick draws again, he cannot amend his score.

The ordinary rule holds that a second declaration cannot be made of the same denomination in the same game. Thus, if a married cannot be married again; a fifth king added to four already declared does not entitle to another score for kings. The fundamental point to be borne in mind is, that no declaration can be effected by the exceptions already made, the scores for declarations three open queens and a queen in hand cannot add it to his open cards. He must win another trick containing a queen, when he can declare queens. Declarations continue during the play of the last eight tricks just the same as during the play of the other cards.

Rubicon Bôizique.—Four packs are used. Nine cards are dealt by three to each player. The rules of Polish bôizique hold good in regard to the position of the cards, to the value of them in the open cards; but a player who receives a hand containing no picture-card (kings, queens, or knave) scores 50 for carte blanche, which he shows. If he does not draw a picture-card, he can again score for carte blanche. The trick is decided by the first sequence or marriage declared. As four packs are used, the bôizique is higher. Triple bôizique counts 1500, quadruple 4500. Tricks are left face upwards till a biseque (ace or ten) is played, when the winner takes all the played cards and puts them in a heap; their only value is the value of the ace, so that when a player wins without the ace, if the trick is closed, then they are used to decide the game. They may be counted during the play, provided there are not more than twelve cards in the stock. Declarations can only be made after winning a trick and before drawing again. A card, double bôizique or triple bôizique may be scored as before; to form the bôiziques may be declared from the hand of either partner. A player may declare: when he or his partner makes a trick. In playing the last eights, nine, and ten, may be used, the tricks are taken from the player who left their cards against each other, and then the other two similarly play theirs. Four people may also play in pairs by consultation, only two packs being then required. A player may declare: when he or his partner makes a trick. In playing the last eights, nine, and ten, may be used, the tricks are taken from the player who left their cards against each other, and then the other two similarly play theirs. Four people may also play in pairs by consultation, only two packs being then required.

BEZWA, a town of British India, in the Kistna district of Madras, on the left bank of the river Kistna, at the head of its delta. Pop. (1901) 24,224. Here are the headquarters of the Kistna canal system, which irrigates more than 500,000 acres, and also provides navigation throughout the delta. The anicut or dam at Bezwada, begun in 1852, consists of a mass of rubble, faced with masonry, 1,240 yds. long. Here also is the central junction of the East Coast railway from Madras to Cuttack, 267 m. from Madras, where one branch line comes down from the Wallangal coalfield in the Nizam's Dominions, and another from Bellary on the Southern Mahatta line. Ancient cuttings on the hills west of Bezwada have been held by some to mark the site of a Buddhist monastery; but others are considered have been quarries. At Undavalle to the south are some noted caves, famed by their inscriptions.

BHAGALPUR, a city of British India, in the Behar province of Bengal, which gives its name to a district and to a division; situated on the right bank of the Ganges, 265 m. from Cuttack. It is a station on the East Indian railway. Pop. (1901) 75,260, showing an increase of 6% in the decade. The chief educational institution is the Tejnarayan Jubilee college (1887), supported almost entirely by fees. Adjacent to the town are the two Augustus Cleveland monuments, one erected by government, and the other by the Hindu, to the memory of the civilian, who, as collector of Bhagalpur at the end of the 18th century, "by conciliation, confidence and benevolence, attempted and accomplished the entire subjection of the lawless and savage inhabitants of the Jungletory of Rajmahal." The District of Bhagalpur stretches across both banks of the Ganges. It has an area of 4,226 sq. m. In 1891 the population was 2,088,955, showing an increase of 3% in the decade. Bhagalpur is a long and narrow district, divided into two unequal parts by the river Ganges. In the southern portion of the district the scenery in parts of the hill-ranges and the highlands which connect them is very beautiful. The hills are of primary formation, with fine masses of contorted gneiss. The ground is broken up into picturesque gorges and deep ravines, and the whole is covered with fine forest trees and a rich undergrowth. Within this portion also lie the lowlands of Bhagalpur, fertile, well planted, well watered, and highly cultivated. The country north of the Ganges is level, but beautifully diversified with trees and verdure. Three fine rivers flow through the district—the Ganges, Kusi and Ghagri. The Ganges runs a course of 60 m., through Bhagalpur, is navigable all the year round, and has an average width of 3 m. The Kusi rises in the Himalayas and falls into the Ganges near Colgong within Bhagalpur. It is a fine stream, navigable up to the foot of the hills, and receives the Ghagri 8 m. above its debouches.

In the early days of British administration the hill people, the Nats and Santals, gave much trouble. They were the original inhabitants of the country, and had considerable influence over the hill tribes. Their numbers are now very small, and they have been gradually driven back into the barren hills and unhealthy forests.

This they avenged from generation to generation by plundering and ravaging the plains. The efforts to subdue or restrain these marauders proved fruitless, till Augustus Cleveland won them by mild measures, and successfully made over the protection of the
district to the very hill people who a few years before had been its scourge. Rice, wheat, barley, oats, Indian corn, various kinds of millet, pulses, oil-seeds, tobacco, cotton, indigo, opium, flax and hemp and sugar-cane, are the principal agricultural products of Bhagalpur district. The jungles afford good pasturage in the hot weather, and abound in lac, silk cocoons, catechu, resin and the mahud fruit, which is both used as fruit and for the manufacture of spirits. Lead ores (chiefly argentiferous galena) and building stone are found, and iron ore is distributed over the hilly country. Attempts made to work the galena in 1878-79 and 1900 were abandoned, and the iron ore is little worked. Gold is washed from the river sand in small particles.

The climate of Bhagalpur partakes of the character both of the deltaic districts of Bengal and of the districts of Behar, between which it is situated. The hot season sets in about the end of March, and continues till the beginning of June, the temperature at this time rising as high as 110° F. The rains usually begin at the end of June and last till the middle of September; average annual rainfall, 55 in. The cold season commences at the beginning of November and lasts till March. During December and January the temperature falls as low as 47° F. The average annual temperature is 78°. Bhagalpur formed a part of the ancient Sanskrit kingdom of Anga. In later times it was included in the powerful Hindu kingdom of Magadha or Behar, and in the 7th century A.D. it was an independent state, with the city of Champa for its capital. It afterwards formed a part of the Mahomedan kingdom of Gaur, and was subsequently subjugated by Akbar, who declared it to be a part of the Delhi empire. Bhagalpur passed to the East India Company by the grant of the emperor Shah Alam in 1765.

There are indigo factories, and other industries include the weaving of tussur silk and the making of coarse glass. A large trade is carried on by rail and river with Lower Bengal. The tract south of the Ganges is traversed by the loop-line of the East Indian railway, and there is also a railway across the northern tract.

The Division of Bhagalpur stretches across the Ganges from the Nepal frontier to the hills of Chota Nagpur. It comprises the five districts of Monghyr, Bhagalpur, Purnea, Darjeeling, and the Santal Parganas. The total area is 19,776 sq. m.; and in 1901 the population was 8,601,405.

BHAMO, a town and district of Burma. The town was in ancient times the capital of the Shan state of Mannaw, later the seat of a Burmese governor. It is now the headquarters of a district in the Mandalay division of Upper Burma (Chinese frontier). It is situated about 300 m. up the river from Mandalay. It is the highest station on the Irrawaddy held by British troops, and the nearest point on the river to the Chinese frontier. In 1901 it contained 10,734 inhabitants, of whom a considerable number were Chinamen, natives of India and Shan-Chinese. It stretches for a distance of nearly 4 m. along the Irrawaddy bank in a series of small villages, transformed into quarters of the town, but the town proper is confined mainly to the one high ridge of land running at right angles to the river. The surface of the ground varies from up land and dry up land on the rise and fall of the river. When the Irrawaddy is at its height the lower portion of the town is flooded, and the country all round is a sheet of water, but usually for no very long time. Here or hereabouts has long been the terminus of a great deal of the land commerce from China. For years after its annexation by Great Britain in 1885 the trade routes were unsafe owing to attacks from Kachins. These have now ceased, and the roads, which were mere bridle-tracks, have been greatly improved. The two chief are the so-called Santa and Ponlaing route, through Manyin (Manwaing) and Nantien to Momein, and the southern or Sawadi route by way of Namkam. Cart roads are now being constructed on both routes, and that south of the Taiping river could easily be continued through Manyin to Momein if the Chinese should be induced to co-operate. There is a fairly large military garrison in Bhamo distributed between two forts to the north and east of the town. There are in general stationed here a native regiment, two sections of a battery and the wing of a European regiment. Besides the barracks there are a circuit house, dak bungalow, courthouse, and post and telegraph offices. There is a branch railway from Myitkyina to Katha, whence there is daily communication by river to Bhamo.

The District of Bhamo lies wholly in the basin of the Irrawaddy, which, as well as its tributaries, runs through the heart of it. On the east of the river is the Shan plateau, running almost due north and south. West of the Irrawaddy there is a regular series of ranges, enclosing the basins of the Kaukkwe, Mosit, Indaw and other streams, down which timber is floated. Beyond the Kaukkwe there is a ridge of hills, which starts at Leka, near Moguang, and diverges to the south, the eastern ridge dividing the Kaukkwe from the Mosit, and the western forming the eastern watershed of the Nam Yim and running south into Katha. It is an offshoot from the latter of these ridges that forms the third defile of the Irrawaddy between Bhamo and Sinbo. The district covers an area of 41,649 sq. m., and the population in 1901 was 79,515. It is mainly composed of Shan-Burmese and Kachins. The Shan-Burmese inhabit the valleys and alluvial land on each side of the river. The Kachins, who probably came from the sub-regions of the Himalayas, occupy the hills throughout the district. There are also settlements of Shans, Shan-Chinese, Chinese and Assamese. There are extensive fisheries in the Shwegu and Mo-hnyin circles, and in the Indaw, a chain of lakes just behind the Mosit, opposite Shwegu. The district abounds in rich teak forests, and there are reserves representing 60,000 acres of teak plantation. The whole of the country along the banks of the Irrawaddy, the Moe, Taiping and Kaukkwe, is generally in a water-logged condition during the rains. The climate in the district is therefore decidedly malarious, especially at the beginning and end of the rains. From November to March there is very bracing cold weather. The highest temperatures range about a few degrees over 100° F. up to 106°, and the lowest a few degrees under 40°. The average maximum for the year is about 87°, the average minimum about 62°. The rainfall averages 72 in. a year.

BHANDARA, a town and district of British India, in the Nagpur division of the Central Provinces. The town (pop. in 1901, 14,023) is situated on the left bank of the river Wainganga, 7 m. from a station on the Bengal-Nagpur railway. It has considerable manufactures of cotton cloth and brass-ware, and a first-grade middle school, with a library.

The District of Bhundara has an area of 3665 sq. m. In 1901 the population was 663,636, showing a decrease of 11% since 1891 compared with an increase of 8% in the preceding decade. The district is bounded on the N., N.E. and E. by lofty hills, inhabited by Gonds and other aboriginal tribes, while the W. and N.W. are comparatively open. Small branches of the Satpura range make their way into the interior of the district. The Ambagar or Sendurjhari hills, which skirt the south of the Chandpur pargana, have an average height of between 300 and 400 ft. above the level of the plain. The other elevated tracts are the Balahi hills, the Kanheri hills and the Undari hills. The Wainganga is the principal river in the district, and the one stream that does not dry up in hot weather,—its affluents within the district being the Bawanthari, Bagh, Kanhan and Chulhan. There are 3648 small lakes and tanks in Bhundara district, whence it is called the "lake region of Nagpur"; they afford ample means of irrigation. More than one-third of the district lies under jungle, which yields gums, medicinal fruit and nuts, edible fruits, lac, honey and the blossoms of the mahua tree (Bassia latifolia), which are eaten by the poorer classes, and used for the manufacture of a kind of spirit. Tigers, panthers, deer, wild hogs and other wild animals abound in the forests, and during the rainy season many deaths occur from snake-bites. Iron is the chief mineral product. Gold is also found in the bed of the Sone river. Laterite, shale and sandstone occur all over the district. Native cloth, brass wares, post-stone wares, cartwheels, straw and reed baskets, and a small quantity of silk, form the only manufactures.

1. The principal crops are rice, wheat, millet, other food-grains,
pulse, linseed, and a little sugar-cane. The district is traversed by the main road from Nagpur to the east, and also by the Bengal-Nagpur railway. It suffered in the famine of 1896-1897, and more severely in 1900.

Bhandara district contains 25 semi-independent chiefships. These little states are exempted from the revenue system, and only pay a light tribute. Their territory, however, is included within the returns of area and population above given. The climate of Bhandara is unhealthy,—the prevailing diseases being fever, small-pox and cholera. Nothing is known of the early history of the district. Tradition says that at a remote period a tribe of men, called the Gaulis or Gaulars, overran and conquered it. At the end of the 17th century it belonged to the Gond reja of Deogarh. In 1743 it was conquered by the Maharrattas, who governed it till 1853, when it lapsed to the British government, the raja of Nagpur having died without an heir.

Bhang, an East Indian name for the hemp plant, *Cannabis sativa* (i.e. Hemp), but applied specially to the leaves dried and prepared for use as a narcotic drug. In India the products of the plant for use as a narcotic and intoxicant are recognized under the three names and forms of Bhang, Gunja or Ganja, and Churrus or Charas. Bhang consists of the larger leaves and capsules of the plant on which an efflorescence of resinous matter has occurred. The leaves are in broken and partly agglutinated pieces, having a dark-green colour and a heavy but not unpleasant smell. Bhang is used in India for smoking, with or without tobacco; it is prepared in the form of a cake or manjan, and it is made into an intoxicating beverage by infusing in cold water and straining. Gunja is the flowering or fruit-bearing tops of the female plants. It is gathered in stalks of several inches in length, the tops of which form a mat-like mass, from the agglutination of flowers, seeds and leaflets by the abundant resinous exudation which coats them. Churrus is the resinous substance separated from the plant. The use of preparations of hemp among the Mussulman and Hindu population of India is very general; and the habit also obtains among the population of central Asia, the Arabs and Egyptians, extending even to the negroes of the valley of the Zambezi and the Hottentots of South Africa. The habit appears to date from very remote times, for Herodotus says of the Scythians, that they creep inside huts and throw hemp seeds on hot stones.

Bharatpur, or Bahrut, a village in the small state of Nagod in India, lying about 24° 15' N. by 86° 45' E., about 120 m. S.W. of Allahabad. General A. Cunningham discovered there in 1873 the remains of a *śūṣṭa* (i.e. a burial mound over the ashes of some distinguished person) which were excavated, in 1874, by his assistant, J. B. Beglar. The results showed that it must have been one of the most imposing and handsome in India; and it is especially important now from the large number of inscriptions found upon it. The ancient name of the place has not been yet traced, but it must have been a considerable city and its site lay on the high road between the ancient capitals of Ujjēnī and Kosāmī. The *śūṣṭa* was circular, 70 ft. in diameter and 42 ft. high. It was surrounded by a stone railing 100 ft. in diameter, so that between railing and *śūṣṭa* there was an open circle round which visitors could walk; and the whole stood towards the east side of a paved quadrangle about 300 ft. by 320 ft., surrounded by a stone wall. On the top of the *śūṣṭa* was an ornament shaped like the letter T, and as the base of the *śūṣṭa* was above the quadrangle, the total height of the monument was between 50 and 60 ft. But its main interest, to us, lies in the railing. This consisted of eighty square pillars, 5 ft. 1 in. in height, connected by cross-bars about 1 ft. broad. Both pillars and cross-bars were elaborately carved in bas-relief, and most of them bore inscriptions giving either the name of the donor, or the subject of the bas-relief, or both. There were four entrances through the railing, facing the cardinal points, and each one protected by the railing coming out at right angles, and then turning back across it in the shape of the letter L. This gave the whole ground plan of the monument, and no doubt designedly so, the shape of a gigantic *svastika* (i.e. a symbol of good fortune). By the forms of the letters of the inscriptions, and by the architectural details, the age of the monument has been approximately fixed in the 3rd century B.C. The bas-reliefs give us invaluable evidence of the literature, and also of the clothing, buildings and other details of the social conditions of the peoples of Buddhist India at that period. The subjects are taken from the Buddhist sacred books, more especially from the accounts given in them of the life of the Buddha in his last or in his previous births. Unfortunately, only about half the pillars, and about one-third of the cross-bars have been recovered. When the *śūṣṭa* was discovered the villagers had already carried off the greater part of the monument to build their cottages with the stones and bricks of it. The process has gone on till now nothing is left except what General Cunningham found and rescued and carried off to Calcutta. Even the mere money value of the lost pieces must be immense, and among them is the central relic box, which they have told us in whose honour the monument was put up.

Bhupal, the Tatar name for the "blue sheep" *Ovis* (Pseudois) *nahora*, of Ladak and Tibet. The general colour is blue-grey with black "points" and white markings and belly; and the horns of the rams are olive-brown and nearly smooth, with a characteristic backward curvature. In the absence of face-glands, as well as in certain other features, the bhural serves to connect more typical sheep (*q.v.*) with goats.

Bharatpur, or Bharut, a native state of India, in the Rajputana agency. Its area covers 3582 sq. m. The country is generally level, about 700 ft. above the sea. Small detached hills, rising to 200 ft. in height, occur, especially in the northern part. These hills contain good building stone for ornamental architecture, and in some of them iron ore is abundant. The Banganga is the only river which flows through the state. It takes its rise at Manoharpur in the territory of Jaipur, and flowing eastward passes through the heart of the Bharatpur state, and joins the Jamna below Agra.

Bharatpur rose into importance under Suraj Mall, who bore a conspicuous part in the destruction of the Delhi empire. Having built the forts of Dig and Khumber in 1730, he received in 1756 the title of raja, and subsequently joined the great Maharratt army with 30,000 troops. But the misconduct of the Maharratt leader induced him to abandon the confederacy, just in time to escape the murderous defeat at Panipat. Suraj Mall raised the Jat power to its highest point; and Colonel Dow, in 1770, estimated the raja's revenue (perhaps extravagantly) at £2,000,000 and his military force at 60,000 or 70,000 men. In 1803 the East India Company concluded a treaty, offensive and defensive, with Bharatpur. In 1804, however, the raja assisted the Maharrattas against the British. The English under Lord Lake captured the fort of Dig and besieged Bharatpur, but were compelled to raise the siege after four attempts at storming. A treaty, concluded on the 17th of April 1805, guaranteed the raja's territory; but he became bound to pay £200,000 as indemnity to the East India Company. A dispute as to the right of the succession again led to a war in 1825, and Lord Combermere captured Bharatpur with a besieging force of 20,000 men, after a desperate resistance, on the 18th of January 1826. The fortifications were dismantled, the hostile chief being deported to Benares, and an infant son of the former raja installed under a treaty favourable to the company. In 1853 the Bharatpur ruler died, leaving a minor heir. The state came under British management, and the administration was improved, the revenue increased, a system of irrigation developed, new tanks and wells constructed and an excellent system of roads and public buildings organized. Owing to the hot winds blowing from Rajputana, the climate of Bharatpur is extremely sultry till the setting in of the periodical rains.

In 1901 the population was 626,665, a decrease of 2%. The estimated revenue is £80,000. The maharanaj Ram Singh, who succeeded his father in 1893, was deprived of power of government
in 1855 on the ground of intertemporal conduct; and in 1900 was finally deposed for the murder of one of his personal attendants. He was succeeded by his infant son Kishen Singh. During his minority the administration was undertaken by a native minister, together with a state council, under the general superintendence of the political agent. Imperial service cavalry are maintained. The state is traversed for about 40 m. by the Rajputana railway.

The City of Bharatpur is 34 m. W. of Agra by rail. The population in 1901 was 43,601, showing a decrease of over 23,000 in the decade. The immense mud ramparts still stand. It has a handsome palace, a new hospital and a high school. There are special manufactures of chaurs, or flappers, with handles of sandalwood, ivory or silver, and tails also made of strips of ivory or sandalwood as fine as horse-hair.

Bhfaston, a town of Nepal, 8 m. from Katmandu. It is a celebrated place of Hindu superstition, the favourite residence of the Brahmins of Nepal, and contains more families of that order than either Katmandu or Patan. It has a population of about 30,000, and its palace and buildings generally are of a more striking appearance than in other Nepalese towns. The town is said to possess many Sanskrit libraries.

Bhattiana, a tract of country in the Punjab province of India, consisting the Ghaggar valley from Fatehabad in the district of Hisar to the right bank of the Ghaggar at Bhatinta, the wild Rajput clan, who held the country lying between Hariana, Bikanir and Bahawalpur. It skirts the borders of the great sandy desert, and only contains a small and scattered population. This tract was ravaged by Timur in his invasion of India; and in 1705 paid a nominal allegiance to George Thomas, the adventurer of Hariana. After the victories of Lord Lake in 1803 it passed with the rest of the Delhi territory under British rule, but was not settled until 1810. A district of Bhattiana was formed in 1837, but in 1858 it was merged in the Sirsa district, which was divided up in 1884. The Bhatti number some 350,000, and are a fine tall race, making capital soldiers.

Bhau Daji (Ramkrishna Vithal) (1822-1874), Hindu physician of Bombay, Sanskrit scholar and antiquary, was born in 1822 at the village of Manjare, in the native state of Sawantwari, of humble parents dealing in clay dolls. Dr Bhau's career is a striking instance of great results arising from small accidents. An Englishman noticing his cleverness at chess induced his father to give the boy an English education. Accordingly Bhau was brought to Bombay and was educated at the Elphinston Institution. He received his father of the cost of his education by winning many prizes and scholarships, and on his father's death two years later he cheerfully undertook the burden of supporting himself and a brother (Narayan), who also in after-life became a distinguished physician and surgeon. About this time he gained a prize for an essay on infanticide, and was appointed a teacher in the Elphinston Institution. He began to devote his time to the study of Indian antiquities, deciphering inscriptions and ascertaining the dates and history of ancient Sanskrit authors. He then studied at the Grant Medical College, and was one of the first batch who graduated there in 1850. In 1851 he set up as a medical practitioner in Bombay, where his success was so great that he soon made a fortune. He studied the Sanskrit literature of medicine, and also tested the value of drugs to which the ancient Hindus ascribed marvellous powers, among other pathological subjects of historical interest investigating that of leprosy. Being an ardent promoter of education, he was appointed a member of the board of education, and was one of the original fellows of the university of Bombay. As the first native president of the students' literary and scientific society, and the champion of the cause of female education, her school was founded in his name, for which an endowment was provided by his friends and admirers. In the political progress of India he took a great and active interest, and the Bombay Association and the Bombay branch of the East Indian Association owe their existence to his ability and exertions. He was twice chosen sheriff of Bombay, in 1869 and 1871.

Various scientific societies in England, France, Germany and America conferred on him their membership. He contributed numerous papers to the journal of the Bombay branch of the Royal Asiatic Society. He found time to make a large collection of rare ancient Sanskrit manuscripts at great cost and trouble. He died in May 1874. His brother, Dr Narayan Daji (who helped him to set up the charitable dispensary in Bombay), did not long survive him. Dr Bhau was a man of the many and amiable character and manners; his kindness and sympathy towards the poor and distressed were unbounded, and endeared his memory among the Hindus of Bombay.

Bhaunagar, or Bhavnagar, a native state of India in the Kathiawar agency, Bombay. Its area covers 2860 sq. m. In 1901 the population was 412,604, showing a decrease of 12% in the decade; the estimated revenue is Rs 2.55,800, and the tribute Rs 10,300. The chief, whose title is thakor sahib, is head of the famous clan of the Ghelol Rajputs of Kathiawar. The enlightened system of administration formed during the rule of the thakor sahib maharaja Sir Takhtsingh Jaswant Singh, G.C.S.I., was continued with admirable results under the personal supervision of his son, the maharaja Bhausinghi, G.C.S.I. (b. 1875), and forms a model for other native states. The Ghelol Rajputs are said to have settled in the district about 1260. Bhavnagar railway station is 60 m. of the Bhavnagar-Gondal railway run through the state, and its terminus at the town of Bhavnagar, which is the principal port. The town of Bhavnagar is situated on the west coast of the gulf of Cambay. The population in 1901 was 66,442. It is the chief port in Kathiawar, though only admitting vessels of small burden. It was founded in 1723 by the thakor sahib Bhausinghi, after whom it is named, in place of his former capital, Sihor, which was considered too exposed to the Mahatta power.

Bheesty (from the Persian bihisti, paradise), the Hindustani name for a water carrier, the native who supplies water to a pigskin or goat-skin bag.

Bhera, a town of British India, in the Shajpur district of the Punjab, situated on the river Jhelum. Pop. (1901) 18,680. It is the terminus of a branch of the North-Western railway. It is an important centre of trade, with manufactures of cotton goods, metal-work, carving, etc. Bhera was founded about 1540 on its present site, but it took the place of a city on the opposite bank of the river, of far greater antiquity, which was destroyed at this period.

Bhils, or Bheils ("bowmen," from Dravidian bili, a bow), a Dravidian people of central India, probably aborigines of Marwar. They live scattered over a great part of India. They are found as far north as the Aravalii Hills, in Sind and Rajputana, as well as Khandesh and Ahmedabad. They are mentioned in Sanskrit works, and it is thought that Ptolemy (vi. 1, 66) refers to them as Phililai ("leaf wavers"), though this word might equally apply to the Gonds. Expelled by the Aryans from the richer lowlands, they are found to-day in greatest numbers on the hills of central India. In many Rajput states the princes on succession have their foreheads marked with blood from the thumb or toe of a Bhill. The Rajputs declare this a mark of Bhill allegiance, but it is more probably a relic of days when the Bhils were a power in India. The Bhils eagerly keep the practice alive, and the right of giving the blood is hereditary in certain families. The popular legend of the Bhill origin assigns them a semi-divine birth. Mahadeva (Siva) having wadded an earth maiden who bore him children, the ugliest of whom killed his father's bull and was banished to the mountains. The Bhils of to-day claim to be his descendants. Under the Moguls the Bhils were submissive, but they rebelled against the Maharrats, who, being unable to subdue them, treated them with the utmost cruelty. The race became outlaws, and they have lived their present wild life ever since. Their nomad habits and skill with their bows helped them to maintain successfully the fight with their oppressors. An unsuccessful attempt was made in 1818 by the British to conquer them. Milder measures were then tried, and the Bhill Agency was formed in 1825. The Bhill corps was then organized.
BHIMA—BHUTAN

with a view to utilizing the excellent fighting qualities of the tribesmen. This corps has done good service in gradually reducing their more lawless countrymen to habits of order, and many Bhils are now settled in regular industries.

The pure Bhil is to-day much what he has always been, a savage forest dweller. The Bhils are a sturdy race, but well built, active and strong, of a black colour, with high cheek-bones, wide nostrils, broad noses and coarse features. Like all Dravidians the hair is long and wavy. The lowland Bhils are not now easily distinguished from the low-caste Hindus. Surgeon-major T. H. Hendley writes:—"The Bhil is a most kind natured animal, knows the shortest cuts over the hills; can walk the roughest paths and climb the steepest crags without slipping or feeling distressed. Though robbers, and timorous owing to ages of ill-treatment, the men are brave when trusted, and very faithful. History proves them always to have been faithful to their nominal Rajput sovereigns, especially in their adversity. The Bhil is a merry soul, loving a jest." The hill Bhils wear nothing but a loin-cloth, their women a coarse robe; lowland Bhils wear turban, coat and waist-cloth. The Bhils have oaths none of them will break. The most sacred is that sworn by a dog, the Bhil praying that the curse of a dog may fall on him if he breaks his word. Their chief divinity is Hanuman, the monkey-god. Offerings are made to the much-feared goddess of smallpox. Stone worship is found among them. Some lowland Bhils and Mosts have adopted Hindooism.

The Bhils of pure blood number upwards of a million, and there are some 200,000 Bhils of mixed descent.

BHIMA (Sanskrit, "The Terrible"), in Hindu mythology, a hero, one of the Pandava princes who figure in the Mahabharata. He was distinguished by his huge body, strength and voracity.

BHIVANI, a town of British India, in the Hissar district of the Punjab, 38 m. S.E. of Hissar town by rail. Pop. (1901) 15,075. It is an important centre of trade with Rajputana, and has factories for ginning and pressing cotton, and metal manufactures. Its rise dates from 1817, when it was made a free market.

BHOPAL, a native state of India, in the central India agency. Its area is 6002 sq. m., and its population in 1901 was 665,061, showing a decrease of 30% in the decade, and the estimated gross revenue is £2,143,71; the tribute, £110. The chief, whose title is pont sachin, is a Brahman by caste. The town of Bhopal is 25 m. south of Poona. In 1901 the population was 4178. The Bhopal Ghat, on the northern border of the state, has always been the main pass over the Western Ghat, or means of communication between the sea-coast and the Deccan. Since 1864 it has been traversed by the main line of the Great Indian Peninsula railway.

BHUND, a town of Barwani India, the capital of the native state of Khach, in the Gwalior division of Bombay, situated at the base of a fortified hill. Pop. (1901) 26,362. It contains some interesting examples of architecture of the middle of the 16th century and later; it was a place sacred to the snake-god Bhujanga.

BHUTAN, an independent kingdom in the Eastern Himalayas, lying between the Brahmaputra and the southern face of the mountains. It is under various commercial and other arrangements with the government of India, from whom it receives an annual subsidy of £3,333. It is bounded on the N. by Tibet; on the E. by a tract inhabited by various uncivilized independent mountain tribes; on the S. by the British province of Assam, and the district of Jalpaiguri; and on the W. by the independent native state of Sikkim. The whole of Bhutan presents a succession of lofty and rugged mountains abounding in picturesque and sublime scenery. This alpine region sends out numerous rivers in a southerly direction, which, forcing their passage through narrow defiles, and precipitated in cataracts over the precipices, eventually pour themselves into the Brahmaputra. Of the rivers traversing Bhutan, the most considerable is the Manas, flowing in its progress to the Brahmaputra under the walls of Tagon Hill, which is unfordable. At the foot of Tagon Hill it is crossed by a suspension bridge. The other principal rivers are the Machu, Tchinchu, Toraha, Manchi and Dharla. Information respecting the country accumulates but slowly. In 1863 Captain Godwin Austen accompanied Sir Ashley Eden’s mission to the court of the Deb raja, and made a survey of the route to Punakha. There has also been a certain amount of geographical sketching combined with trigonometrical
observations; and there are the routes surveys of native explorers. In 1887-1888 two native Indian explorers "R. N." and "P. A." traversed a part of Western Bhutan, but were forced to retire owing to the disturbed state of the districts. They re-entered the country on the east from Dewangiri. Here they explored the Kuru, or Lhobrak Chu, which proves to be the largest river in Bhutan. It drains the tract between the Yamdok Tsu and Tigul Lakes, and is fed by the glaciers of the Kulha Kangri and other great ranges. The Lhobrak was finally identified with the Manas river, a geographical discovery of some importance. A previously unknown tribe, the Chingmas, were discovered in Eastern Bhutan, who are socially on a higher level than the Bhutias, and differ from them chiefly in the matter of wearing pigtails. Some excellent survey work was done in Bhutan by a native surveyor during the progress of the Tibetan Expedition in 1904. The Monla Kachung pass (17,500 ft.), by which "R. N." crossed into Tibet, is nearly on the median of Guatama, and is one of the most important passes between Bhutan and Tibet. East of Bhutan, amongst the semi-independent hill states which sometimes own allegiance to Tibet and sometimes assert complete freedom from all authority, the geographical puzzle of the course of the Tsango, the great river of Tibet, has been solved by the researches of Captain Harman, and the explorations of the native surveyor "K. P." The Tsango has been definitely ascertained to be the same river as the Brahmaputra. The tracts inhabited by the aboriginal tribes entitled Lo Naikpo, Lo Karpo and Lo Tawa ("Lo" signifies "barbarous" in Tibetan), are described as a pleasant country; the lands on either side of the Tsango being well cultivated and planted with mangoes, plantains and oranges.

Nothing is known certainly about the area and population of Bhutan, the former being estimated at 16,800 sq. m. At the head of the Bhutan government there are nominally two supreme authorities, the Damm raja, the spiritual head, and the Deh raja, the temporal ruler. Recently official correspondence has been written in the name of the Damm raja, but it is not known whether this change really signifies anything. To aid these rajas in administering the country, there is a council of permanent ministers, called the Lenehen. Practically, however, there is no government at all. Subordinate officers and rapacious governors of forts wield all the power of the state, and tyranny, oppression and anarchy reign over the whole country. The Damm raja succeeds as an incarnation of the deity. On the death of a Damm raja a year or two elapses, and the new incarnation then reappears in the shape of a child who generally happens to be born in the family of a principal officer. The child establishes his identity by recognizing the cooking utensils, &c., of the late Damm raja; he is then trained in a monastery, and on attaining his majority is recognized as raja, though he exercises no more real authority in his majority than he did in his infancy. The Deh rajas are in their turns, selected by the council. In practice he is merely the nominee of whichever of the two governors of East and West Bhutan happens for the time to be the more powerful. The people are industrious, and devote themselves to agriculture, but from the geological structure of the country, and from the insecurity of property, regular husbandry is limited to comparatively few spots. The people are oppressed and poor. "Nothing that a Bhutia possesses is his own," wrote the British envoy in 1864; "he is at all times liable to lose it if it attracts the cupidity of any one more powerful than himself. The lower classes, whether villagers or public servants, are little better than the slaves of higher officials. In regard to them no rights of property are observed, and they have at once to surrender anything that is demanded of them. There never was, I fancy, a country in which the doctrine of 'might is right' formed more completely the whole and sole law and custom of the land than it does in Bhutan. No official receives a salary; he has certain districts made over to him, and he may get what he can out of them; a certain portion of his gains he is compelled to send to the durbah; and the more he extends and the more he sends to his superior, the longer his tenure of office is likely to be."

Physically the Bhutias are a fine race, although dirty in their habits and persons. Their food consists of meat, chiefly pork, turnips, rice, barley-meal and tea made from the brick-tea of China. Their favourite drink is chong, distilled from rice or barley and millet, and Marod, beer made from fermented millet. A loose woollen coat reaching to the knees, and bound round the waist by a thick fold of cotton cloth, forms the dress of the men; the women's dress is a long cloak with loose sleeves. The houses of the Bhutias are of three and four stories; all the floors are neatly boarded with deal; and on two sides of the house is a verandah ornamented with carved work generally painted. The Bhutias are neat joiners, and their doors, windows and panelling are perfect in their way. No iron-work is used; the doors open on ingenious wooden hinges. The appearance of the houses is precisely that of Swiss chalets, picturesque and comfortable—the only drawback being a want of chimneys, which the Bhutias do not know how to construct. The people nominally profess the Buddhist religion, but in reality, their religious exercises are confined to the propitiation of evil spirits, and the mechanical recital of a few sacred sentences. Around the cottages in the mountains the land is cleared for cultivation, and produces thriving crops of barley, wheat, buckwheat, millet, mustard, chillies, etc. Turnips of excellent quality are extensively grown; they are free from fibre and remarkably sweet. The wheat and barley have a full round grain, and the climate is well adapted to the production of both European and Asiatic vegetables. Potatoes have been introduced. The Bhutias lay out their fields in a series of terraces cut out of the sides of the hills; each terrace is riveted and supported by stone embankments, sometimes 20 ft. high. Every field is carefully fenced with pine branches, or protected by a stone wall. A complete system of irrigation permeates the whole cultivated part of a village, the water being often brought from a long distance by stone aqueducts. Bhutias do not care to extend their cultivation, as an increased revenue is barely proportionate to the land cultivated, but devote their whole energies to make the land yield twice what it is estimated to produce. The forests of Bhutan abound in many varieties of stately trees. Among them are the beech, ash, birch, maple, cypress and yew. Firs and pines cover the mountain heights; and below these, but still at an elevation of eight or nine thousand feet, is a zone of vegetation, consisting principally of oaks and rhododendrons. The cinnamon tree is also found. Some of the roots and branches were examined by Captain Samuel Turner during his journey to Tibet; but the plant being neither in blossom nor bearing fruit, it was impossible to decide whether it was the true cinnamon or an inferior kind of cassia. The leaf, however, corresponded with the description given of the true cinnamon by Linnaeus. The lower ranges of the hills abound in animal life. Elephants are so numerous as to be dangerous to the Buddhists; but tigers are not uncommon, except near the river Tista, and in the dense reed jungle and forests of the Dwarbs. Leopards abound in the Hah valley; deer everywhere, some of them of a very large species. The musk deer is found in the snows, and the barking deer on every hill side. Wild hogs are met with even at great elevations. Large squirrels are common. Bears and rhinoceros are also found. Pheasants, jungle fowls, pigeons and other small game abound. The Bhutias are no sportsmen. They have a superstitious objection to firing a gun, thinking that it offends the deities of the woods and valleys, and brings down rain. A species of horse, which seems indigenous to Bhutan, and is used as a domestic animal, is called tgang, from Tangastan, the general appellation of that assemblage of mountains which constitutes the territory of Bhutan. It is peculiar to this tract, not being found in any of the neighbouring countries of Assam, Nepal, Tibet or Bengal, and unites in an eminent degree the two qualities of strength and beauty. The tgang horse usually stands about thirteen hands high, is short-bodied, clean-limbed, deep in the chest and extremely active, his colour usually inclining to piebald. In so barren and rude a country the manufacturing industry of its people is, as might be expected,
in a low stage, the few articles produced being all destined for home consumption. These consist of coarse blankets and cotton cloths made by the villagers inhabiting the southern tract. Leather, from the hides of the buffalo, imperfectly tanned, furnishes the soles of snow boots. Cloaks are neatly turned from various woods. A small quantity of paper is made from a plant described as the *Daphne papyrifer*. Swords, iron spears and arrow-heads, and a few copper caldrons, fabricated from the metal obtained in the country, complete the list of manufactures.

Trade connections are rather with Tibet than with India. In 1901-1902 the value of the import and export trade with British India amounted only to £57,000. The military resources of the country are on an insignificant scale. Beyond the guards for the defence of the various castles, there is nothing like a standing army. The total military force was estimated by the British envoy in 1864 at 6000. The climate of Bhutan varies according to the difference of elevation. At the time when the inhabitants of Punakha (the winter residence of the rajas) are afraid of exposing themselves to the blazing sun, those of Ghasa experience all the rigour of winter, and are chilled by perpetual snows. Yet these places are within sight of each other. The rains descend in floods upon the heights; but in the vicinity of Tasiusion, the capital, they are moderate; there are frequent showers, but nothing that can be compared to the tropical rains of Bengal. Owing to the great elevation and steepness of the mountains, disastrous storms arise among the hollows, often attended with fatal results.

**History.**—Bhutan formerly belonged to a tribe called by the Bhutias Teph, generally believed to have been the people of Kuch Behar. About A.D. 1670 some Tibetan soldiers subjugated the Teph, took possession of the country and settled down in it. The relations of the British with Bhutan commenced in 1772, when the Bhutias invaded the principality of Kuch Behar, a dependency of Bengal. The Kuch Behar Raja applied for aid, and a force under Captain James was despatched to his assistance; the invaders were expelled and pursued into their own territories. Upon the intercession of Teshu Lama, then regent of Tibet, a treaty of peace was concluded in 1774 between the East India Company and the ruler of Bhutan. In 1783 Captain S. Turner was deputed to Bhutan, with a view of promoting commercial intercourse, but his mission proved unsuccessful. From this period little intercourse took place with Bhutan, until the occupation of Assam by the British in 1826. It was then discovered that the Bhutias had usurped several tracts of low land lying at the foot of the mountains, called the Dwar or passes, and for these they were paid a small tribute. The British, not satisfied with the procured submission, and availed themselves of the command of the passes to commit depredations within the British territory. Captain R. B. Pemberton was accordingly deputed to Bhutan to adjust the points of difference. But his negotiations yielded no definite result; and every other means of obtaining redress and security proving unsuccessful, the Assam Dwar were wrested from the Bhutias, and the British government consented to pay to Bhutan a sum of £1000 per annum as compensation for the resumption of their tenure, during the good behaviour of the Bhutias. Continued outrages and aggressions were, however, committed by the Bhutias on British subjects in the Dwar. Nothwithstanding repeated remonstrances and threats, scarcely a year passed without the occurrence of several raids in British territory headed by Bhutia officials, in which they plundered the inhabitants, massacred them, or carried them away as slaves. In 1863 Sir Ashley Eden was sent as an envoy to Bhutan to demand reparation for these outrages. He did not succeed in his mission; he was subjected to the grossest insults; and under compulsion signed a treaty giving over the disputed territory to Bhutan, and making other concessions which the British government demanded. On Sir A. Eden's return the viceroy at once disavowed his treaty, sternly stopped the former allowance for the Assam Dwar, and demanded the immediate restoration of all British subjects kidnapped during the last five years. The Bhutias not complying with this demand, the government-general issued a proclamation, dated the 12th of November 1864, by which the eleven Western or Bengal Dwar were forthwith incorporated with the queen's Indian dominions. No resistance was at first offered to the annexation, but, suddenly, in January 1865, the Bhutias, under the English garrison at Dewangri, and the post was abandoned with the loss of two mountain guns. This disaster was soon retrieved by General Sir Henry Tombs, and the Bhutias were compelled to sue for peace, which was concluded on the 11th of November 1865. The Bhutan government formally ceded all the eighteen Dwar of Bengal and Assam, with the rest of the territory taken from them, and agreed to liberate all kidnapped British subjects. As the revenues of Bhutan mainly depended on these Dwar, the British government, in return for these concessions, undertook to pay the Deb and Dhram rajas annually, subject to the condition of their continued good behaviour, an allowance beginning at £2500 and rising gradually to the present figure. That since that the annexed territories have settled down into peaceful and prosperous British districts. The recent relations between the Indian government and Bhutan have been satisfactory, and during the troubles with Tibet in 1904 the attitude of the Bhutias was perfectly correct and friendly.

See Report on Explorations in Sikkim, Bhutan and Tibet (Denv, Jervis); "The Teshudon, or our present Knowledge of the Shoshan," R.G.S. Proceedings, vol. iii. (T. H. H.)*

**BIANCHINI, FRANCESCO** (1662–1729). Italian astronomer and antiquary, was born of a noble family at Verona on the 13th of December 1662. In 1684 he went to Rome, and became librarian to Cardinal Ottoboni, who, as Pope Alexander VIII. (1689), raised him to the offices of papal chamberlain and canon of Santa Maria Maggiore. Clement XI. sent him on a mission to Paris in 1712, and employed him to form a museum of Christian antiquities. He died at Rome on the 2nd of March 1729. A paper by him on G. D. Cassini's new method of parallaxes was inserted in the *Acta Eruditorum* of Leipzig in 1685. He published separately:—*Istoria Universale* (Roma, 1697), only one volume of which appeared; *De Calendario et Cyclo Caesaris* (1703); *Hesperi et Phosphori nova Phaenomena* (1719), in which he inserted *Venus* to rotate in 244 days; and (posthumously) *Astronomiae et Geographiae Observationes Selectae* (1737) and *Opuscula Varia* (1754). See Fontenelle's "Éloge. (Mémoires de l'Acad. de l'Histoir, p. 102, Paris, 1729); Mazzoleni, *Vita di Francesco Bianchini* (Verona, 1735); Tipaldo, *Biografia degli Italiani Illustri*, vii. 288 (Venezia, *1840*); Mazzuchelli, *Scrittori d'Italia*; Maffei, *Verona Illustrata*, p. 254. &c.

**BIARRITZ,** a watering-place of south-western France, in the department of Basses-Pyrénées, on the sea-coast about 5 m. W. of Biarritz (pop. 1906) 13,631. From a mere fishing village, with a few hundred inhabitants, in the south-east side of the 19th century, Biarritz rose rapidly into a place of importance under the patronage of the emperor Napoleon III. and the empress Eugénie, with whom it was a favourite resort. The town is situated on a promontory jutting north-west into the Bay of Biscay and on the coast which extends on each side of it. The beach to the north-east is known as the Grande Plage, that to the south-west as the Côte des Basques. The Grande Plage is more than half a mile long and stretches to the Cap St Martin, on which stands a lighthouse. It is divided into two parts by a small headland once the site of the villa of the empress Eugénie, between which and the main promontory are the two casinos, the principal baths and many luxurious villas and fine hotels. Towards the north-east the promontory of Biarritz ends in a projection known as the Atalaye, crowned by the ruins of a castle and surrounded by rocky islets. Some of these are united to the mainland and to each other by jetties which curve round so as to form the Port de Refuge, a haven available only in fair weather. South-west of the Atalaye lies the Port-Vieux, a sheltered cove now used only as a bathing-place. The Port des Pêcheurs, the principal of the three harbours, is on the south-east side of the town. Apart from unimportant manufactures of pottery, chocolate, &c., fishing is the only industry; Biarritz depends for its prosperity on the visitors who are attracted by its mild climate and the
bathing. The season is almost continuous; in the winter the English, in the summer Russians, Spaniards and French fill the hotels in the town. Among its attractions is a golf club, established in 1888, with a course of 18 holes.

**BIAS** of Priene in Ionia, one of the so-called Seven Sages of Greece, son of Teutamus, flourished about 570 B.C. He was famous for his patriotism, the nobility of his character and his eloquence. A number of gnomes or aphorisms are attributed to him, which may be found collected in F. W. A. Mullach, Fragmenta Philosophorum Graecorum (1860). He is said to have written a poem on the best means of making Ionia prosperous. His advice to its inhabitants, at the time of the Persian invasion, to migrate to Sardinia and there found a single pan-Tycoon city (Herodotus i. 170), has generally been regarded as historical. One much-quoted saying of his may be mentioned. When his native town was besieged by the enemy, the inhabitants resolved to escape with their most valuable belongings. One of them seeing Bias without anything, advised him to follow the example of the rest. "I am doing so," said he, "for I carry all my belongings with me" (ommia mea mecum porto). He was honoured with a splendid funeral, and a sanctuary called Teutamium was dedicated to him in the city of Priene.

See Bohren, De Septem Sapientibus (1860).

**BIBACULUS, MARCUS FURIUS**, Roman poet, flourished during the last century of the Republic. According to Jerome, he was born at Cremona in 103 B.C., and probably lived to a great age. He wrote satirical poems after the manner of Catullus, whose bitterness he rivalled, according to Quintillian (Instit. x. 1. 196), in his imitab. He even attacked Augustus (and perhaps Caesar), who treated the matter with indifference. He was also author of prose Lucrations and perhaps of an epic poem on Caesar's Gallic wars (Prognostio Belli Gallici). Otto Rodter attributes the short poems usually assigned to Virgil. It is doubtful whether he is the person ridiculed by Horace (Satires, ii. 5. 40) and whether he is identical with the turgidus Alpinus (Satires, i. 10. 36), the author of an Aethiopic attributing the death and life of Memnon and of a poem on the Rhine. Some critics, on the ground that Horace would not have ventured to attack so dangerous an adversary, assume the existence of a poet whose real name was Furius (or Cornelius) Alpinus. Bibaculus was ridiculed for his high-flown and exaggerated style and manner of expression.

See Weichert, "De M. Furio Bibaculo," in his Poetarum Latinorum Reliquiae (1830); fragments in L. Müller's edition of Catullus in the Teubner Series (1870).

**BIER, HEINRICH JOHANN FRANZ VON** (1644-1704), German violinist and composer, was for some time musical conductor at Salzburg, and was ennobled by the emperor Leopold in 1687. He is regarded as the earliest important German composer for the violin, his works including sonatas and church music.

**BIBERACH**, a town of Germany, in the kingdom of Württemberg, on the Riss, a small affluent of the Danube, 22 m. S.S.W. from Ulm. Pop. (1900) 8390. It is still surrounded by medieval walls and towers, and is strikingly picturesque. Its principal church dates from the 12th century, and it possesses a hospital with rich endowments. Its main industries are cloth, bell-casting, toys and zinc wares, and its fruit markets are famous. Biberach appears as a village in the 8th century, and in 1312 it became a free imperial city. During the Thirty Years' War it underwent various vicissitudes, and was for a while held by the Swedes. In 1707 it was captured and put to ransom by the French, who afterwards, in 1796 and 1800, defeated the Austrians in the neighbourhood. In 1803 the city was deprived of its imperial freedom and assigned to Baden, and in 1806 was transferred to Württemberg. Biberach is the birthplace of the sculptor Johann Lorenz Natter (1705-1753) and the painter Bernhard Neher (1806-1886); Christoph Martin Wieland, born in 1733 at the neighbouring village of Oberholzheim, spent several years in the town.

**BIBIRINE, or BIBERINE, C₉H₆NO₃**, an alkaloid obtained from the bark and fruit of the greenheart (q.v.) tree, Nectandra rodias, called bibiru or sipiri in Guiana, where the tree grows. The substance was discovered about the year 1835 by Hugh Rodie, a surgeon in Demerara, who used it as a febrifuge in substitution for quinine.

**BIBLE.** The word "Bible," which in English, as in medieval Latin, is treated as a singular noun, is in its original Greek form a plural, ΒΙΒΛΙΑ, the (sacred) books—correctly expressing the fact that the sacred writings of Christendom (collectively described by this title) are made up of a number of independent records, which set before us the successive stages in the history of revelation. The origin of each of these records forms a distinct critical problem, and for the sake of convenience of detail the reader is referred to the separate articles on the Biblical books. An account of the Bible as a whole involves so many aspects of interest, that, apart from the separate articles on its component books, the general questions of importance arising out of its present shape require to be discussed in separate sections of this article. They are here divided accordingly, into two main divisions:—(A) Old Testament, and (B) New Testament; and under each of these are treated (1) the Canon, (2) the texts and versions, (3) textual criticism, (4) the "higher criticism," i.e. a general historical account (more particularly considered for separate books in the articles on them) of the criticism and views based on the substance and matter, as apart from criticism devoted to the correction and elucidation of the text, and (5) chronology. For the literary history of the translated English Bible, see the separate article under BIBLE, ENGLISH.

(A) **OLD TESTAMENT**

1. **Canon**

We shall begin by giving a general account of the historical and literary conditions under which the unique literature of the Old Testament sprang up, of the stages by which it gradually reached its present form, and (so far as this is possible) of the way in which the Biblical books were brought together in a canonical collection. There exists no formal historical account of the formation of the Old Testament canon. The popular idea that this canon was closed by Ezra has no foundation in antiquity. Certainly in the apocryphal book of 2 Esdras, written towards the end of the 1st century A.D., we read (xiv. 26-26, 38-48), that, the law being burnt, Ezra, at his own request, was miraculously inspired to rewrite it; he procured accordingly five skilled scribes, and dictated to them for forty days, during which time they wrote 94 books, i.e. not only (according to the Jewish reckoning) the 24 books of the Old Testament, with 70 apocryphal books as well, which, being filled, it is said, with a mixture of error, or esoteric wisdom, are placed upon even a higher level (vv. 46, 47) than the Old Testament itself. No argument is needed to show that this legend is unworthy of credit; even if it did deserve to be taken seriously, it still contains nothing respecting either a compilation of the canon, or even a collection, or redaction, of sacred books by Ezra. Yet it is frequently referred to by patriotic writers; and Ezra, on the strength of it, is regarded by them as the genuine restorer of the lost books of the Old Testament (see Ezra).

In 2 Macc. ii. 13 it is said that Nehemiah, "founding a library, gathered together the things concerning the kings and prophets, and the (writings) of David, and letters of kings about sacred gifts." These statements are found in a part of 2 Macc. which is admitted to be both late and full of untrustworthy matter; still, the passage may preserve an indistinct reminiscence of an early stage in the formation of the canon, the writings referred
to being possibly the books of Samuel and Kings and some of the Prophets, a part of the Psalter, and documents such as those excerpted in the book of Ezra, respecting edicts issued by Persian kings in favour of the Temple. But obviously nothing definite can be built upon a passage of this character.

The first traces of the idea current in modern times that the canon of the Old Testament was closed by Ezra are found in the 13th century A.D. From this time, as is clearly shown by the series of quotations in Ryle’s *Canon of the Old Testament*, p. 257 ff. (2nd ed., p. 260 ff.), the legend—for it is nothing better—grew, until finally, in the hands of Elias Levi (1538), and especially of Johannes Buxtorf (1663), it assumed the form that the “men of the Great Synagogue”—a body the real existence of which is itself very doubtful, but which is affirmed in the Talmud to have “written” (!) the books of Ezekiel, the Minor Prophets, Daniel and Esther—with Ezra as president, first collected the books of the Old Testament into a single volume, restored the text, where necessary, from the best MSS., and divided the collection into three parts, the Law, the Prophets and the “Writings” (the Hagiographa). The reputation of Elias Levi and Buxtorf led to this view of Ezra’s activity being adopted by other scholars, and so it acquired general currency. But it rests upon no authority in antiquity whatever.

The statement just quoted, however, that in the Jewish canon the books of the Old Testament are divided into three parts, though the arrangement is wrongly referred to Ezra, is in itself both correct and important. “The Law, the Prophets and the Writings (i.e. the Hagiographa)” is the standing Jewish expression for the Old Testament; and in every ordinary Hebrew Bible the books are arranged accordingly in the following three divisions:

1. The Tórah (or “Law”), corresponding to our “Pentateuch” (5 books).
2. The “Prophets,” consisting of eight books, divided into two groups:
   a. The “Former Prophets”; Joshua, Judges, Samuel, Kings.
   b. The “Latter Prophets”; Isaiah, Jeremiah, Ezekiel, the Minor Prophets (called by the Jews “the Twelve,” and counted by them as one book).
3. The “Writings,” also sometimes the “Sacred Writings,” i.e., as we call them, the “Hagiographa,” consisting of three groups, containing in all eleven books:
   a. The poetical books, Psalms, Proverbs, Job.
   b. The five Megillot (or “Rolls”)—grouped thus together in later times, on account of the custom which arose of reading them at the synagogues at five sacred seasons—Song of Songs, Ruth, Lamentations, Ecclesiastes, Esther.
   c. The remaining books, Daniel, Ezra and Nehemiah (forming one book), Chronicles.

There are thus, according to the Jewish computation, twenty-four “books” in the Hebrew canon. The threefold division of the canon just given is recognized in the Talmud, and followed in all Hebrew MSS., the only difference being that the books included in the Latter Prophets and in the Hagiographa are not always arranged in the same order. No book, however, belonging to one of these three divisions is ever, by the Jews, transferred to another. The expansion of the Talmudic twenty-four to the thirty-nine Old Testament books of the English Bible is effected by reckoning the Minor Prophets one by one, by separating Ezra from Nehemiah, and by subdividing the long books of Samuel, Kings and Chronicles. The different order of the books in the English Bible is due to the fact that when the Hebrew Bible was translated into Greek between the 3rd and 1st centuries B.C., the Hebrew tripartite division was disregarded, and the books (including those now known as the “Apocrypha”) were grouped mostly by subjects, the historical books being placed first (Genesis—Esther), the poetical books next (Job—Song of Songs), and the prophetic books last (Isaiah—Malachi).

1 The books of Samuel, Kings, Ezra and Nehemiah, and Chronicles, were by the Jews each treated (and written) as one book, and were not divided by them into two till the 16th century, through Christian influence.

Substantially the same order was followed in the Vulgate. The Reformers separated the books which had no Hebrew original (i.e. the Apocrypha) from the rest, and placed them at the end; the remaining books in the Vulgate, were then in the order which they still retain in the English Bible.

The tripartite division of the Hebrew canon thus recognized by Jewish tradition can, however, be traced back far beyond the Talmud. The Proverbs of Jesus, the son of Sirach (c. 200 B.C.), which form now the apocryphal book Ecclesiasticus, were translated into Greek by the grandson of the author about 150 B.C.; and in the preface prefixed by him to his translation he speaks of “the law, and the prophets, and the other books of our fathers,” and again of “the law, and the prophets, and the rest of the books,” expressions which point naturally to the same threefold division which was afterwards universally recognized by the Jews. The terms used, however, do not show that the Hagiographa was already completed, as we now have it; it would be entirely consistent with them, if, for instance, particular books, as Esther, or Daniel, or Ecclesiastes, were only added to the collection subsequently. Another allusion to the tripartite division is also no doubt to be found in the expression “the law, the prophets, and the psalms,” in Luke xxiv. 44. A collection of sacred books, including in particular the prophets, is also referred to in Dan. ix. 2 (R.V.), written about 166 B.C.

The threefold division of the Old Testament, it cannot reasonably be doubted, rests upon an historical basis. It represents three successive stages in the history of the collection. The Law was the first part to be definitely recognized as authoritative, or canonized; the “Prophets” (as defined above) were next accepted as canonical; the more miscellaneous collection of books comprised in the Hagiographa was recognized last. In the absence of all external evidence respecting the formation of the canon, we are driven to internal evidence in our endeavour to fix the dates at which these three collections were thus canonized. And internal evidence points to the conclusion that the Law could scarcely have been completed, and accepted formally, as a whole, as canonical before 444 B.C. (cf. Neh. viii.—x.); that the “Prophets” were completed and so recognized about 250 B.C., and the Hagiographa between about 150 and 100 B.C. (See further Ryle’s *Canon of the Old Testament*.)

Having thus fixed approximately the terminus ad quem at which the Old Testament was completed, we must now begin at the other end, and endeavour to sketch in outline the process by which it gradually reached its completed form. And here it will be found to be characteristic of nearly all the longer books of the Old Testament, and in some cases even of the shorter ones as well, that they were not completed by a single hand, but that they were gradually expanded, and reached their present form by a succession of stages.

Among the Hebrews, as among many other nations, the earliest beginnings of literature were in all probability poetical. At least the opening phrases of the song of Moses in Exodus xxv.; the song of Deborah in Judges v.; the fragment from the “Book of the Wars of Yahweh,” in Numbers xxi. 14, 15; the war-ballad, celebrating an Israelitish victory, in Numbers xxii. 27–30; the extracts from the “Book of Jashar” (or “of the Upright,” no doubt a title of Israel) quoted in Joshua x. 12, 13 (“Sun, stand thou still upon Gibeon,” &c.); in 2 Sam. i. (David’s elegy over Saul and Jonathan); and, very probably, in the Septuagint of 1 Kings viii. 13 [Sept. 53.], as the source of the poetical fragment in vv. 12, 13, describing Solomon’s building of the Temple, show how great national occurrences and the deeds of ancient Israelitish heroes stimulated the national genius for poetry, and evoked lyric songs, suffused with religious feeling, by which their memory was perpetuated. The poetical descriptions of the character, or geographical position, of the various tribes, now grouped together as the Blessings of Jacob (Gen. xlix.) and Moses (Deut. xxxiii.), may be mentioned at the same time. These poems, which are older, and in most cases considerably older, than the narratives in which they are now embedded, if they were collected into books, must have been fairly numerous,
and we could wish that more examples of them had been preserved.

The historical books of the Old Testament form two series: one, consisting of the books from Genesis to 2 Kings (exclusive of Ruth, which, as we have seen, forms in the Hebrew canon part of the Hagiographa), embracing the period from the Creation to the destruction of Jerusalem by the Chaldeans in 586 B.C.; the other, comprising the books of Chronicles, Ezra and Nehemiah, beginning with Adam and ending with the second visit of Nehemiah to Jerusalem in 432 B.C. These two series differ from one another materially in scope and point of view, but in one respect they are both constructed upon a similar plan; no entire book in either series consists of a single, original work; but older writings, or sources, have been combined by a compiler—or sometimes, in stages, by a succession of compilers—in such a manner that the points of juncture are often clearly discernible, and the sources are in consequence capable of being separated from one another. The authors of the Hebrew historical books, as we now have them, do not, as a rule, as a modern author would do, recast the matter in their own language; they excerpt from pre-existing documents such passages as are suitable to their purpose, and incorporate them in their work, sometimes adding at the same time matter of their own. Hebrew writing, however, exhibits usually much strongly marked individualities of style that the documents or sources, thus combined, can generally be distinguished from each other, and from the comments or other additions of the compiler, without difficulty. The literary differences are, moreover, often accompanied by differences of treatment, or representation of the history, which, where they exist, confirm independently the conclusions of the literary analysis. Although, however, the historical books generally are constructed upon similar principles, the method on which these principles have been applied is not quite the same in all cases. Sometimes, for instance, the excerpts from the older documents form long and complete narratives; in other cases (as in the account of the Flood) they consist of a number of short passages, taken alternately from two older narratives, and dovetailed together to make a continuous story; in the books of Judges and Kings the compiler has fitted together a series of older narratives in a framework supplied by himself; the Pentateuch and book of Joshua (which form a literary whole, and are now often spoken of together as the Hexateuch) have passed through more stages than the books just mentioned, and the compiler's hand is more clearly visible in them. In one passage of 2 Kings 12:15, the compiler has even added a sentence which is not part of the original narrative.

The Hexateuch (Gen.-Josh.).—The traditions current among the Israelites respecting the origins and early history of their nation—the patriarchal period, and the times of Moses and Joshua—were probably first cast into a written form in the 10th or 9th century B.C. by a prophet living in Judah, who, from the almost exclusive use in his narrative of the sacred name "Jahveh" ("Jehovah"),—or, as we now commonly write it, Yahweh,—is referred to among scholars by the abbreviation "J." This writer, who is characterized by a singularly bright and picturesque style, and also by deep religious feeling and insight, begins his narrative with the account of the creation of man from the dust, and tells of the first sin and its consequences (Gen. ii. 4-iii. 24); then he gives an account of the early growth of civilization (Gen. iv.), of the Flood (parts of Gen. vi.-viii.), and the origin of different languages (xi. 1-9); afterwards in a series of vivid pictures he gives the story, as tradition told it, of the patriarchs, of Moses and the Exodus, of the journey through the wilderness, and the conquest of Canaan. It would occupy too much space to give here a complete list of the passages belonging to "J"; but examples of his narrative (with the exception here and there of a verse or two belonging to one of the other sources described below) are to be found, for instance, in Gen. xii., xiii., xviii.-xxi. (the visit of the three angels to Abraham, and the judgment on Sodom and Gomorrah), xxiv. (Abraham's servant sent to find a wife for Isaac), xxvii. 1-45 (Jacob obtaining his father's blessing), xxxii., xxxiii., xxxiv. (parts of the history of Joseph); Ex. iv.-v. (mostly), xxi. 20-32, 25-26, 29-41; xxxvii. 1-11, xxxix. 12-xxxiv. 26 (including, in xxxiv. 17-26, a group of regulations, of a simple, undeveloped character, on various religious observances); Num. x. 29-36, and most of Num. xii.

Somewhat later than "J," another writer, commonly referred to as "E," from his preference for the name Elohim ("God") rather than "Jehovah," living apparently in the northern kingdom, wrote down the traditions of the past as they were current in northern Israel, in a style resembling generally that of "J," but not quite as bright and vivid, and marked by small differences of expression and representation. The first traces of "E" are found in the life of Abraham, in parts of Gen. xv.; examples of other passages belonging to this source are:—Gen. xx. 1-17, xxi. 8-32, xxii. 1-14, xl.-xlii., and xliv. (except a few isolated passages); Ex. xviii., xx.-xxii. (including the decalogue—in its original, terser form, without the explanatory additions now attached to several of the commandments—and the collection of laws, known as the "Book of the Covenant," in xxii.-xxiii., xxiii., xxxii. 7-11; Num. xii., most of Num. xxxii.-xxiv. (the history of Balaam); Josh. xxiv. "E" thus covers substantially the same ground as "J," and gives often a parallel, though somewhat divergent, version of the same events. The laws contained in Ex. xx. 23-xxiii. 19 were no doubt taken by "E" from a pre-existing source; with the regulations referred to in Lev. xxvi. 26-28, they form the oldest legislation of the Hebrews that we possess; they consist principally of civil ordinances, suited to regulate the life of a community living under simple conditions of society, and chiefly occupied in agriculture, but partly also of elementary regulations respecting religious observances (altars, sacrifices, festivals, &c.).

Not long, probably, after the fall of the northern kingdom in 722 B.C., a prophet of Judah conceived the plan of compiling a comprehensive history of the traditions of his people. For this purpose he selected extracts from the two narratives, "J" and "E," and combined them together into a single narrative, introducing in some places additions of his own. This combined narrative is commonly known as "JE." As distinguished from the Priestly Narrative (to be mentioned presently), it has a distinctly prophetic character; it treats the history from the standpoint of the prophets, and the religious ideas characteristic of the prophets often find expression in it. Most of the best-known narratives of the patriarchal and Mosaic ages belong to "JE." His style, especially in the parts belonging to "J," is graphic and picturesque, the descriptions are vivid and abundant in detail and colloquial, and both his religious feeling and his poetic feeling are warmly and sympathetically expressed in it.

Deuteronomy.—In the 7th century B.C., during the reign of either Manasseh or Josiah, the narrative of "JE" was enlarged by the addition of the discourses of Deuteronomy. These discourses purport to be addresses delivered by Moses to the assembled people, shortly before his death, in the land of Moab, opposite to Jericho. There was probably some tradition of a farewell address delivered by Moses, and the writer of Deuteronomy gave this tradition form and substance. In impressive and persuasive oratory he sets before Israel, in a form adapted to the needs of the age in which he lived, the fundamental principles which Moses had taught. Yahweh was Israel's only god, who tolerated no other god beside Himself, and who claimed to be the sole object of the Israelite's reverence. This is the fundamental thought which is insisted on and developed in Deuteronomy with great eloquence and power. The truths on which the writer loves to dwell are the sole godhead of Yahweh, His spirituality (ch. iv.), His choice of Israel, and the love and faithfulness with which He had shown towards it, by redeeming it from slavery in Egypt, and placing it in a free and fertile land, from which are deduced the great practical duties of loyalty and loving devotion to Him, an uncompromising repudiation of all false gods, the rejection of all heathen practices, a cheerful and ready obedience to His will, and a warm-hearted and generous attitude towards man. Love of God is the primary spring of human duty (vi. 5). In the course of his argument (especially in chs. xii.-xxvi.), the writer takes up most of the laws, both civil
and ceremonial, which (see above) had been incorporated before into the "J" and "E," together with many besides which were current in Israel; these, as a rule, he expands, applies or enforces with motives; for obedience to them is not to be rendered merely in deference to external authority, it is to be prompted by right moral and religious motives. The ideal of Deuteronomy is a community of which every member is full of love and reverence towards his God, and of sympathy and regard for his fellow-men. The "Song" (Deut. xxxii.) and "Blessing" (Deut. xxxiii.) of Moses are not by the author of the discourses; and the latter, though not Mosaic, is of considerably earlier date.

The influence of Deuteronomy upon subsequent books of the Old Testament is very perceptible. Upon its promulgation it speedily became the book which both gave the religious ideals of the age, and moulded the phraseology in which these ideals were expressed. The style of Deuteronomy, when once it had been formed, lent itself readily to imitation; and thus a school of writers, imbued with its spirit, and using its expressions, quickly arose, who have left their mark upon many parts of the Old Testament. In particular, the parts of the compo

---

The Priestly sections of the Hexateuch (known as "P") remain still to be considered. That these are later than "JE," and even than Deut., is apparent—to mention but one feature—from the more complex ritual and hierarchical organization which they exhibit. They are to all appearance the work of a school of priests, who, after the destruction of the Temple in 586 B.C., began to write down and codify the ceremonial regulations of the pre-exilic times, combining them with an historical narrative extending from the Creation to the establishment of Israel in Canaan; and who completed their work during the century following the restoration in 537 B.C. The chief object of these sections is to describe in detail the leading institutions of the theocracy (Tabernacle, sacrifices, purifications, &c.), and to refer them to their traditional origin in the Mosaic age. The history as such is subordinate; and except at important epochs is given only in brief summaries (e.g. Gen. xix. 29, xli. 46). Statistical data (lists of names, genealogies, and precise chronological notes) are a conspicuous feature in it. The legislation of "P," though written down in or after the exile, must not, however, be supposed to be the creation of that period; many elements in it can be shown from the older literature to have been of great antiquity in Israel; it is, in fact, based upon pre-exilic usage, though in some respects it is a development of the older and simpler ceremonial institutions of Israel ultimately assumed. In "P's" picture of the Mosaic age there are many ideal elements; it represents the priestly ideal of the past rather than the past as it actually was. The following examples of passages from "P" will illustrate what has been said:—Gen. i. 1-2, iv. 17. (institution of circumcision), xxiii. (purchase of the cave of Machpelah), xxv. 7-17, xli. 6-27; Ex. vi. 2-3, xiii, xxv.-xxvii. (directions for making the Tabernacle, its vessels, dress of the priests, &c.), xxxvii.-xxviii. (execution of these directions); Lev. (the whole); Num. i. 1-x. 28 (census of people, arrangement of camp, and duties of Levites, law of the Nazirite, &c.), xv. xviii., xix., xxvi.-xxvii., xxxi., xxxii.-xxxv., Josh. v. 10-12, the greater part of xv.-xxix. (distribution of the land among the different tribes), xii. 1-42.

The style of "P" is strongly marked—as strongly marked, in fact, as (in a different way) that of Deuteronomy is; numerous expressions not found elsewhere in the Hexateuch occur in it repeatedly. The section Lev. xvi.-xxvi. has a character of its own; for it consists of a substratum of older laws, partly moral (chs. xviii.-xx. mostly), partly ceremonial, with a hortatory conclusion (ch. xxvi.), with certain very marked characteristics (from one of which it has received the name of the "Law of Holiness"), which have been combined with elements belonging to, or conceived in the spirit of, the main body of "P."

Not long after "P" was completed, probably in the 5th century B.C., the whole, consisting of "JE" and Deuteronomy, was combined with it; and the existing Hexateuch was thus produced.

Judges, Samuel and Kings.—The structure of these books is simpler than that of the Hexateuch. The book of Judges consists substantially of a series of older narratives, arranged together by a compiler, and provided by him, where he deemed it necessary, with introductory and concluding comments (e.g. ii. 11-iii. 6, iii. 12-15, 30, iv. 1-5, 23, 24, v. 31). The compiler is strongly imbued with the spirit of Deuteronomy; and the object of his comments is partly to exhibit the chronology of the period as he conceived it, partly to state his theory of the religious history of the time. The compiler will be written Hebrew before c. 600 B.C.; the narratives incorporated by him will in most cases have been considerably earlier. The books of Samuel centre round the names of Samuel, Saul and David. They consist of a series of narratives, or groups of narratives, dealing with the lives of these three men, arranged by a compiler, who, however, unlike the compilers of Judges and Kings, rarely allows his own hand to appear. Some of these narratives are to all appearance nearly contemporary with the events that they describe (e.g. i. Sam. i. 1-16, ii. 1-11, 15, xiii.-xiv., xxvii.-xxx.; 2 Sam. i.-xx.); others are later. In 1 Sam. the double (and discrepant) accounts of the appointment of Saul as king (ix. 1-16, xi. 1-11, 15, xiii.-xiv., xvi.-xx.), and of the introduction of David to the history (xvi. 14-23 and xvii. 1-17; xvii. 5) are noticeable; in x. 1-16, xi. 1-11, 15, the monarchy is viewed as God's gracious gift to His people; in xii. 17-27, xii., which reflect the feeling of a much later date, the monarchy is viewed unawares, and represented as granted by God unwillingly. The structure of the book of Kings resembles that of Judges. A number of narratives, evidently written by prophets, and in many of which also (as those relating to Elijah, Elisha and Isaiah) prophets play a prominent part, and a series of short statistical notices, relating to political events, and derived probably from the official annals of the two kingdoms (which are usually cited at the end of a king's reign), have been arranged together, and sometimes expanded at the same time, in a framework supplied by the compiler. The framework is generally recognizable without difficulty. It comprises the chronological details, references to authorities, and judgments on the character of the various kings, especially as regards their attitude to the worship at the high places, all cast in the same literary mould, and marked by the same characteristic phraseology. Both in point of view and in phraseology the compiler shows himself to be strongly influenced by Deuteronomy. The two books appear to have been substantially completed before the exile; but short passages were probably introduced into them afterwards. Examples of passages due to the compiler: 1 Kings ii. 3-8, viii. 14-61 (the prayer of dedication put into Solomon's mouth), ix. 1-9, xi. 32-39, xiv. 7-11, 19-20, 21-24, 20-31, xv. 1-15, xvi. 20-26; 2 Kings ix. 7-10, xvii. 7-23.

The Latter Prophets.—Isaiah, Jeremiah, Ezekiel, the Twelve. The writings of the canonical prophets form another important element in the Old Testament, also, like the historical books, of gradual growth. Beginning with Amos and Hosea, they form a series which was not completed till more than three centuries had passed away. The activity of the prophets was largely called forth by crises in the national history. They were partly moral reformers, partly religious teachers, partly political advisers. They held up before a backsliding people the ideals of human duty, of religious truth and of national policy. They expanded and developed, and applied to new situations and
circumstances of the national life, the truths which in a more
general form they had inherited from their ancestors. The
nature and attributes of God; His gracious purposes towards
man; the relation of man to God, with the practical conse-
quences that follow from it; the true nature of religious service;
the call to repentance as the condition of God’s favour; the
ideal of character and action which each man should set
before himself; human duty under its various aspects; the
responsibilities of office and position; the claims of mercy and
philanthropy, justice and integrity; indignation against the
oppression of the weak and the unprotected; ideals of a blissful
future, when the troubles of the present will be over, and
men will bask in the enjoyment of righteousness and felicity,—these,
and such as these, are the themes which are ever in the prophets’
mouths, and on which they enlarge with unwearying eloquence
and power.

For the more special characteristics of the individual prophets,
reference must be made to the separate articles devoted to each;
it is impossible to do more here than summarize briefly the
literary structure of their various books.

Isaiah.—The book of Isaiah falls into two clearly distinguished
parts, viz. chs. i.–xxxix., and xlv–xlii. Chs. xl–xlii., how-
ever, are not by Isaiah, but are the work of a prophet who
wrote about 540 B.C., shortly before the conquest of Babylon
by Cyrus, and whose aim was to encourage the Israelites in
exile, and assure them of the certainty of their approaching restoration
to Canaan. (According to many recent critics, this
prophet wrote only chs. xl–lv., chs. lvi–lxxix. being added
subsequently, some time after the return.)

The genuine prophecies of Isaiah are contained in chs. i.–xii., xiv., 24–xxii.,
xxviii.–xxxiii., xxxvii., 22–32,—all written between 740 and
700 B.C. (or a little later), and all (except ch. vi.) having reference
to the condition of Judah and Israel, and the movements of the
Assyrians during the reigns of Ahaz and Hezekiah. The opinion
has, however, latterly gained ground that parts even of these
chapters are of later origin than Isaiah’s own time. Of the rest of
chs. i.–xvi. this is generally admitted. Thus chs. xii.,
xiv., 23, xxi., 1–10, xxxiv.–xxxv. belong to the same age as
chs. xl–lxi., xliii., xiv., 23, and xxi., 1–10, looking forward
similarly to the approaching fall of Babylon; chs. xxv.–xxxvii.
have a character of their own, and form an apocalypse written
not earlier than the 5th century B.C.; chs. xxxvi.–xxxviii.,
describing incidents in which Isaiah took a part, consist of
narratives excerpted from 2 Kings xviii., 13–33, with the addition of
Hezekiah’s song (xxxiii. 9–20). It is evident from these
facts that the book of Isaiah did not assume its present form
until considerably after the return of the Jews from exile in 537;
when a compiler, or series of compilers, arranged the genuine
prophecies of Isaiah which had come to his hands, together with
others which at the time were attributed to Isaiah, and gave
the book its present form.

Jeremiah.—Jeremiah’s first public appearance as a prophet
was in the 13th year of Josiah (Jer. i. 2, xxv. 3), i.e. 626 B.C.,
and his latest prophecy (ch. xlviv.) was delivered by him in
Egypt, whither he was carried, against his will, by some of the
Jews who had been left in Judah, shortly after the fall of Jeru-
salem in 586. Jeremiah was keenly conscious of his people’s
sin; and the aim of most of his earlier prophecies is to bring
his countrymen, if possible, to a better mind, in the hope that
thereby the doom which he sees impending may be averted,—an
end which eventually he saw clearly to be unattainable.
Jeremiah’s was a sensitive, tender nature; and he lamented, with
great pathos and emotion, his people’s sins, the ruin to which
he saw his country hastening, and the trials and persecutions
which his predictions of disaster frequently brought upon him.
A large part of his book is biographical, describing various
incidents of his ministry. Prophecies of restoration are contained
in chs. xxxvi.–xxxvii. The prophecies of the first twenty-three
years of his ministry, as we are expressly told in ch. xxviii.,
were first written down in 604 B.C. by his friend and apanauosis
Baruch, and the roll thus formed must have formed the nucleus
of the present book. Some of the reports of Jeremiah’s pro-
phetic, and especially the biographical narratives, also probably,
have Baruch for their author. But the chronological disorder
of the book, and other details, show that Baruch could not
have been the compiler of the book, but that the prophecies
and narratives contained in it were collected together gradually,
and that it reached its present form by a succession of stages,
which were not finally completed till long after Israel’s return
from Babylon. The long prophecy (i. 1–l. 58), announcing the
approaching fall of Babylon, is not by Jeremiah, and cannot
have been written till shortly before 538 B.C.

Ezekiel.—Ezekiel was one of the captives who were carried
with Jehoiachin in 597 B.C. to Babylonia, and was settled with
many other exiles at a place called Tel-’abib (ii. 15). His
prophecies (which are regularly dated) are assigned to various
years from 592 to 570 B.C. The theme of the first twenty-four
chapters of his book is the impending fall of Jerusalem, which
took place actually in 586, and which Ezekiel foretells in a series
of prophecies, distinguished by great variety of symbolism and
imagery. Chs. xxv.–xxxii. are on various foreign
nations, Edom, Tyre, Egypt, &c. Prophecies of Israel’s future
recovery follow in chs. xxxiii.–lvii., chs. xl–lxvii. being
remarkable for the minuteness with which Ezekiel describes
the organization of the restored community, as he would fain
see it realized, including even such details as the measurements
and other arrangements of the Temple, the sacrifices to be offered
in it, the duties and revenues of the priests, and the redistribu-
tion of the country among the twelve tribes.
The book of Ezekiel bears throughout the stamp of a single mind; the
prophecies contained in it are arranged methodically; and to all
appearance—in striking contrast to the books of Isaiah and
Jeremiah—it received the form in which we still have it from
the prophet himself.

The Twelve Minor Prophets.—These, as was stated above,
were reckoned by the Jews as forming a single “book.” The
two earliest of the Minor Prophets, Amos and Hosea, prophesied
in the northern kingdom, at about 750 and 740 B.C. respectively;
both foresaw the approaching ruin of northern Israel at the
hands of the Assyrians, which took place in fact when Sargon
took Samaria in 722 B.C.; and both did their best to stir their
people to better things. The dates of the other Minor Prophets
(in some cases approximate) are: Micah, c. 725–c. 680 B.C.
(some passages perhaps later); Zephaniah, c. 625; Nahum,
shortly before the destruction of Nineveh by the Manda in 607;
Habakkuk (on the rise and destiny of the Chaldaean empire)
605–600; Obadiah, after the destruction of Jerusalem by the
Chaldeans in 586; Haggai, 520; Zechariah, i.–vii. (as in
Haggai, promises and encouragements connected with the re-
building of the Temple) 520 and 518 B.C.; and finally
Joel, 5th century B.C.; Jonah, 4th century B.C. The latest
prophecies in the book are, probably, those contained in Zech.
ix.–xiv. which reflect entirely different historical conditions
from Zech. i.–vii. (520 and 518 B.C.), and may be plausibly
assigned to the period beginning with the conquests of Alexander
the Great, between 332 and c. 300 B.C. Why these prophecies
were attached to Zech. i.–vii. must remain matter of conjecture;
but there are reasons for supposing that, together with the
prophecy of Malachi, they came to the compiler of the “book”
of the Twelve Prophets anonymously, and he simply attached
them at the point which his collection had reached (i.e. at the
end of Zech. viii.).

The Psalms.—The Psalter is that part of the Old Testament
in which the devotional aspect of the religious character finds
its complete expression; and in lyrics of exquisite tenderness
and beauty the most varied emotions are poured forth by the
psalmists to their God—despondency and distress, penitence
and resignation, hope and confidence, jubilation and thank-
fulness, adoration and praise. The Psalter, it is clear from many
indications, is not the work of one compiler, but was formed
gradually. A single compiler is not likely to have introduced
double recensions of one and the same psalm (as Ps. lii. =
Ps. xiv., Ps. lxx. = Ps. xi. 13–17, Ps. cvii. = Ps. liii. 7–11
lx. 5–12); in the Hebrew canon the Psalter is composed of five
books (i.-xii., xiii.-xxxix., xc.-cvi., cvi.-cl); and in many parts it is manifestly based upon independent smaller collections; for it contains groups of psalms headed “David,” the “sons of Korah,” “Asaph,” “Songs of Ascents.” Each of the five books of which it is composed contains psalms which show that its compilation cannot have been completed till after the return from the Captivity; and indeed, when the individual psalms are studied carefully it becomes apparent that in the great majority of cases they presuppose the historical conditions, or the religious experiences, of the ages that followed Jeremiah. Thus, though it is going too far to say that there are no pre-exilic psalms, the Psalter, as a whole, is the expression of the deeper spiritual feeling which marked the later stages of Israel’s history. It has been not inaptly termed the Hymn-book of the second Temple. Its compilation can hardly have been finally completed before the 3rd century b.c.; if it is true, as many scholars think, that there are psalms dating from the time of the Maccabean struggle (Ps. xliv., lxxxiv., lxxix., lxxxi., and perhaps others), it cannot have been completed till after 165 b.c.

The Book of Proverbs.—This is the first of the three books belonging to the Wisdom-literature of the Hebrews, the other two books being Job and Ecclesiastes. The Wisdom-literature is divided into three sections, of which we should call the philosophy of human nature, and sometimes also of physical nature as well; its writers observed human character, studied action in its consequences, laid down maxims for education and conduct, and reflected on the moral problems which human society presents. The book of Proverbs consists essentially of generalizations on human character and conduct, with (especially in chs. i.-ix.) moral exhortations addressed to an imagined “son” or pupil. The book consists of eight distinct portions, chs. i.-ix. being introductory, the proverbs, properly so called, beginning at x. 1 (with the title “The Proverbs of Solomon”), and other, shorter collections, beginning at xxii. 17, xxiv. 23, xxv. 1, xxx. 1, xxxi. 1, xxxi. 10 respectively. The book, it is evident, was formed gradually. A small nucleus of the proverbs may be Solomon’s; but the great majority represent no doubt the generalizations of a long succession of “wise men.” The introduction, or “Praise of Wisdom,” as it has been called (chs. i.-ix.), commending the maxims of Wisdom as a guide to the young, will have been added after many centuries; and the book, which contains a few records of iniquities, will not have finally reached its present form before the 4th century B.C. Some scholars believe that it dates entirely from the Greek period (which began 332 B.C.); but it may be doubted whether there are sufficient grounds for this conclusion.

Job.—The book of Job deals with a problem of human life; in modern phraseology it is a work of religious philosophy. Job is a righteous man, overwhelmed with undeserved misfortune; and thus the question is raised, Why do the righteous suffer? Is their suffering consistent with the justice of God? The dominant theory at the time when Job was written was that all suffering was a punishment of sin; and the aim of the book is to controvert this theory. Job’s friends argue that he must have been guilty of some grave sin; Job himself passionately maintains his innocence; and on the issue thus raised the dialogue of the book turns. The outline of Job’s story was no doubt supplied by tradition; and a later poet has developed this outline, and made it a vehicle for expressing his new thoughts respecting a great moral problem which perplexed his contemporaries. In a variety of poetic forms (mostly e.g. in the 4th century B.C.) he shows that the book of Job was not written till after the time of Jeremiah—probably, indeed, not till after the return from exile. The speeches of Elihu (chs. xxxii.-xxxvii.) are not part of the original poem, but were inserted in it afterwards.

There follow (in the Hebrew Bible) the five short books, which, as explained above, are now known by the Jews as the Megilloth, or “Rolls,” viz. Song of Songs, Ruth, Lamentations, Ecclesiastes and Esther. Of these, the Song of Songs, in exquisite poetry, extols the power and sweetness of pure and faithful human love. The date at which it was written is uncertain; there are features in it which point to its having been the work of a poet living in north Israel, and writing at an early date; but most recent scholars, on account chiefly of certain late expressions occurring in it, think that it cannot have been written earlier than the 4th or 3rd century B.C. In the graceful and tender idyll of Ruth, it is told how Ruth, the Moabitess, and a native consequently of a country hostile theocratically to Israel, adopted Israel’s faith (i. 16), and was counted worthy to become an ancestress of David. The date of Ruth is disputed: Driver has defended a pre-exilic date for it, but the general opinion of modern scholars is that it belongs to the 5th century B.C. The Lamentations consist of five elegies on the fall of Jerusalem, and the sufferings which its people experienced in consequence; they must all have been composed not long after 586 B.C. Ecclesiastes, the third book belonging (see above) to the Wisdom-literature, consists of moralizing, prompted by the dark times in which the author’s lot in life was cast, on the disappointments which seemed to him to be the reward of all human endeavour, and the inability of man to remedy the injuries and anomalies of society. If only upon linguistic grounds—for the Hebrew of the book resembles often that of the Mishnah more than the ordinary Hebrew of the Old Testament—Ecclesiastes must be one of the latest books in the Hebrew canon. It was most probably written during the Seleucid era, towards the end of the 3rd century B.C.

The book of Esther, which describes, with many legendary traits, how the beautiful Jewess succeeded in rescuing her people from the destruction which Haman had prepared for them, will not be earlier than the closing years of the 4th century B.C., and is thought by many scholars to be even later.

The Book of Daniel.—The aim of this book is to strengthen and encourage the pious Jews in their sufferings under the persecution of Antiochus Epiphanes, 168-165 B.C. Chs. i.-vi. consist of narratives, constructed no doubt upon a traditional basis, of the experiences of Daniel at the Babylonian court, between 605 and 538 B.C., with the design of illustrating how God, in times of trouble, defends and succours His faithful servants. Chs. vii.-xii. contain a series of visions, purporting to have been seen by Daniel, and describing, sometimes (especially in ch. xi.) with considerable minuteness, the course of events from Alexander the Great, through the two royal lines of the Ptolemies and the Seleucidae, to Antiochus Epiphanes, dwelling in particular on the persecuting measures adopted by him against the Jews, predicting the tyrant’s speedy fall (see e.g. viii. 9-14, 23-25, xi. 21-45). Internal evidence shows clearly that the book cannot have been written by Daniel himself; and that it must in fact be a product of the period in which its interest culminates, and the circumstances of which it so accurately reflects, i.e. of 168-165 B.C.

Chronicles, Ezra and Nehemiah.—These books form the second series of historical books referred to above, Ezra and Nehemiah carrying on the narrative of Chronicles, and forming its direct sequel. 1 Chr. i.-ix. consists mostly of tribal genealogies, partly based upon data contained in the older books (Gen.—Kings), partly including materials found by the compiler elsewhere. 1 Chr. x.-2 Chr. xxxvi. consists of a series of excerpts from the books of Samuel and Kings—sometimes transcribed without substantial change, at other times materially altered in the process—combined with matter, in some cases limited to a verse or two, in others extending to several chapters, contributed by the compiler himself, and differing markedly from the excerpts from the older books both in phraseology and in point of view. The books of Ezra and Nehemiah are of similar structure: here the sources excerpted are the Memoirs of Ezra and Nehemiah, written by themselves in the first person; viz. Ezra vii. 12-ix. (including the decree of Artaxerxes, vii. 12-26); Neh. i. 1-ii. 7; xii. 31-44; xiii.; and a narrative written in Aramaic (Ezra iv. 8-16); Ezra x. and Neh. viii.—xi. also are in all probability based pretty directly upon the Memoirs of Ezra; the remaining parts of the books are the composition of the compiler. The additions of the compiler, especially in the Chronicles, place the old history in a new light; he invests it with the associations of his own day; and pictures pre-exilic Judah as already possessing the fully developed ceremonial
system, under which he lived himself, and as ruled by the ideas and principles current among his contemporaries. There is much in his representation of the past which cannot be historical. For examples of narratives which are his composition see 1 Chr. xv. 1-24, xvi. 4-42, xxii. 2-xxiii.; 2 Chr. xiii. 3-22, xiv. 6-xxv. 15, xvi. 7-11, xvii., xix. 1-xx. 30, xxvi. 16-20, xxix. 3-xxxi. 21. On account of the interest shown by the compiler in the ecclesiastical aspects of the history, his work has been not inaptly called the "Ecclesiastical Chronicle of Jerusalem." From historical allusions in the book of Nehemiah, it may be inferred that the compiler wrote at about 300 B.C. (S. R. D.)

2. Texts and Versions.

Text.—The form in which the Hebrew text of the Old Testament is presented to us in all MSS, and printed editions is that of the Massoretic text, the date of which is usually placed somewhere between the 6th and 8th centuries of the Christian era. It is probable that the present text became fixed as early as the 2nd century A.D., but even this earlier date leaves a long interval between the original autographs of the Old Testament writers and our present text. Since the fixing of the Massoretic text the task of preserving and transmitting the sacred books has been carried out with the greatest care and fidelity, with the result that the text has undergone practically no change of any real importance; but before that date, owing to various causes, it is beyond dispute that a large number of corruptions were introduced into the Hebrew text. In dealing, therefore, with the textual criticism of the Old Testament it is necessary to determine the period at which the text assumed its present fixed form before considering the means at our disposal for controlling the text when it was, so to speak, in a less settled condition.

An examination of the extant MSS of the Hebrew Old Testament reveals two facts which at first sight are somewhat remarkable. The first is that the oldest dated MS., the Codex Babylonicus Petropolitanus, only goes back to the year A.D. 916, though it is probable that one or two MSS. belong to the 9th century. The second fact is that all our Hebrew MSS. represent one and the same text, viz. the Massoretic. This text was the work of a special guild of trained scholars called Massoretes ( massa rot ] or "masters of tradition" ( massa rot or less correctly massa rot ),[1] whose aim was not only to preserve and transmit the consonantal text which had been handed down to them, but also to ensure its proper pronunciation. To this end they provided the text with a complete system of vowel points and accents.[2] Their labours further included the compilation of a number of notes, to which the term Massorah is now usually applied. These notes for the most part constitute a sort of index of the peculiarities of the text, and possess but little general interest. More important are those passages in which the Massoretes have definitely adopted a variation from the consonantal text. In these cases the vowel points attached to the written word ( Ket"obh ) belong to the word which is to be substituted for it, the latter being placed in the margin with the initial letter of Qeresh (= to be read) prefixed to it. Many of these readings merely relate to variations of spelling, pronunciation or grammatical forms; others substitute a more correct expression for the coarser phrase of the text, but in some instances the suggested reading really affects the sense of the passage. These last are to be regarded either as old textual variants, or, more probably, as emendations corresponding to the errata or corrigenda of a modern printer. They do not point to any change in the editing of the text; for the aim of the Massoretes was essentially conservative. Their object was not to create a new text, but rather to ensure the accurate transmission of the traditional text which they themselves had received. Their work may be said to culminate in the vocalized text which resulted from the labours of Rabbi Aaron ben Asher in the 10th century.[3] But the writings of Jerome in the 4th, and of Origen in the 3rd century both testify to a Hebrew text practically identical with that of the Massoretes. Similar evidence is furnished by the Mishna and the Gemara, the Targums, and lastly by the Greek version of Aquila,[4] which dates from the first half of the 2nd century A.D. Hence it is hardly doubtful that the form in which we now possess the Hebrew text was already fixed by the beginning of the 2nd century. On the other hand, evidence such as that of the Book of Jubilees shows that the form of the text still fluctuated considerably as late as the 1st century A.D., so that we are forced to place the fixing of the text some time between the fall of Jerusalem and the production of Aquila's version. Nor is the occasion far to seek. After the fall of Jerusalem the new system of biblical exegesis founded by Rashi Hillel reached its climax at Jamnia under the famous Rabbi Aquiba (c. 123). The latter's system of interpretation was based upon an extremely literal appreciation of the text, according to which the smallest words or particles, and sometimes even the letters of scripture, were invested with divine authority. The inevitable result of such a system must have been the fixing of an officially recognized text, which could scarcely have differed materially from that which was finally adopted by the Massoretes. That the standard edition was not the result of the critical investigation of existing materials may be assumed with some certainty.[5] Indeed, it is probable, as has been suggested,[6] that the manuscript which was adopted as the standard text was an old and well-written copy, possibly one of those which were preserved in the Court of the Temple.

But if the evidence available points to the time of Hadrian as the period at which the Hebrew text assumed its present form, it is even more certain that prior to that date the various MSS. of the Old Testament differed very materially from one another. Sufficient proof of this statement is furnished by the Samaritan Pentateuch and the versions, more especially the Septuagint. In the Talmudic story of wanting in the Hebrew text itself to show that in earlier times the text was treated with considerable freedom. Thus, according to Jewish tradition, there are eighteen passages in which the older scribes deliberately altered the text on the ground that the language employed was either irreverent or liable to misconception. Of a similar nature are the changes introduced into proper names, e.g. the substitution of bosheth (= shame) for ba'al in Ishbosheth (2 Sam. ii. 8) and Mephibosheth (2 Sam. ix. 6; cf. the older forms Eshbaal and Meribaal, 1 Chron. vii. 34, 35); the use of the verb "to bless" ( tash ) in the sense of cursing (1 Kings xxi. 10, 13; Job i. 5, 11, ii. 5, 9; Ps. x. 3); and the insertion of the "enemies of" in 1 Sam. xxv. 22, 2 Sam. xii. 14. These intentional alterations, however, only affect a very limited portion of the text, and, though it is possible that other changes were introduced at different times, it is very

3. The Talmudic text of the three MSS, preserved in the court of the temple ( Schorhim, vi. 4 ) sufficiently illustrates the tentative efforts of the rabbis in this direction.

5. For these Tiqqunim Schorhim or "corrections of the scribal" see Geiger, Umschriften, pp. 299 f.; Strack, Prolegomena Critica, p. 87; Buhl, Canon and Text of the Old Testament, pp. 101 f. In the Mezilah (Exod. xxv. 7) only eleven passages are mentioned. Less important are the Iturim Schorhim, or five passages in which the scribes have omitted a waw from the text.

6. For a discussion of this word see W. Bacher (J.Q.R. vol. iii. pp. 789 f.), who maintains that the original pronunciation of these words was massa rot and massa rot.
unlikely that they were either more extensive in range or more important in character. At the same time it is clear both from internal and external evidence that the archetypal MSS. are descended far from being a perfect representative of the original text. For a comparison of the different parallel passages which occur in the Old Testament (e.g. 1 and 2 Samuel, 1 and 2 Kings, and 1 and 2 Chronicles; 2 Kings xviii. 13-xx. 19 and Isaiah xxxvi.-xxxix; 2 Sam. xxii. and Ps. xvii.; Ps. xiv. and liii., etc.) reveals many variations which are obviously due to textual corruptions, while there are many passages which in their present form are either ungrammatical, or inconsistent with the context or with other passages. Externally also the ancient versions, especially the Septuagint, frequently exhibit variations from the Hebrew which are not only intrinsically more probable, but often explain the difficulties presented by the Massoretic text. Our estimate of the value of these variant readings, moreover, is considerably heightened when we consider that the MSS. on which the versions are based are older by several centuries than those from which the Massoretic text was derived; hence the text which they presuppose has no slight claim to be regarded as an important witness for the original Hebrew.

The use of the ancient versions is (to quote Prof. Driver) "not always such a simple matter as might be inferred. . . . In the use of the ancient versions for the purposes of textual criticism no consideration can be disregarded. It is impossible to observe that we possess the version itself in its original integrity; we must eliminate such variants as have the appearance of originating merely with the translator, the remainder, which will be those that are due to a difference of text in the MS. (or MSS.) used by the translator, we must then compare carefully, in the light of the considerations just stated, with the existing Hebrew text, in order to determine on which side the superiority lies." 

Versions.—In point of age the Samaritan Pentateuch furnishes the earliest external witness to the Hebrew text. It is not a version, but merely that text of the Pentateuch which has been preserved by the Samaritan community since the time of Ptolemy Philometor (Neh. xii. 33-37), etc. About 432 B.C. It is written in the Samaritan script, which is closely allied to the old Hebrew as opposed to the later "square" character. We further possess a Samaritan Targum of the Pentateuch written in the Samaritan dialect, a variety of western Aramaic, and also an Arabic translation of the five books of the law; the latter dating perhaps from the 11th century A.D. or earlier. The Samaritan Pentateuch agrees with the Septuagint in many passages, but its chief importance consists of those which agree as to the substantial agreement of our present text of the Pentateuch, apart from certain intentional changes, with that which was promulgated by Ezra. Its value for critical purposes is considerably discounted by the late origin of the Targums, and the text of the Targums is often corrupt.

The Targums, or Aramaic paraphrases of the books of the Old Testament (see Targum), date from the time when Hebrew had become superseded by Aramaic as the language spoken by the Jews, i.e. during the period immediately preceding the Christian era. In their written form, however, the earlier Targums, viz. those on the Pentateuch and the prophetic books, cannot be earlier than the 4th or 5th century A.D. Since they were designed to meet the needs of the people and to have a directly edifying and didactic tendency, they are necessarily characterized by a feature of translation, and thus afford invaluable illustrations of the methods of Jewish interpretation and of the development of Jewish thought. The text which they exhibit is virtually identical with the Massoretic text.

The oldest among the versions as well as the most important for the textual criticism of the Old Testament is the Septuagint. This version probably arose out of the need of the Greek-speaking Jews in Alexandria in the 3rd century B.C. According to tradition the law was translated into Greek during the reign of Ptolemy Philadelphus (284-247 B.C.), and, though the form (viz. the Letter of Aristides) in which this tradition

Versions of Aquila, Sym- machus, Theodotion. Aquila was a Jewish proselyte of Pontus, and since he was a disciple of Rabbi Aquila (d. A.D. 135), and according to the statement of Schurer (Geschichte des jiidischen Volkes, Bd. ii. p. 324) the immediate predecessors of Aquila, his version may be assigned to the first half of the 2nd century. It is characterized by extreme literalness, and clearly reflects the peculiar system of excogitations which was then in vogue among the Jewish rabbis. Its chief interest lies in the fact that it was received with favour by the Hellenistic Jews, among whom it quickly superseded the older Septuagint. For what remains of this version, which owing to its character is of the greatest value to the textual critic, there are only a few excerpts, (a) in the form of a new temple legend in the Book of Daniel, (b) in the form of a translation of a passage from the Book of Wisdom. Theodotion's version differs from those of Aquila and Symmachus in that it was not an independent translation, but rather a revision of the Septuagint on the basis of the current Hebrew text. He retained, however, those passages of which there was no Hebrew equivalent, or which did not correspond to the older translation. The Septuagint MSS. of the Septuagint have been largely influenced by Theodotion's translation. In the case of the book of Daniel, as we learn from Jerome (praefatio in Dan.), the translation of Theodotion was definitely adopted by the Church, and is accordingly found in the New Testament. The most probable explanation of this phenomenon is that these renderings are derived from an early Greek translation, differing from the Septuagint proper, but closely allied to that version in the MS. of the Codex Chaldaicus.

Symmachus, according to Eusebius and Jerome, was an Ebionite; Epiphanius represents him (very improbably) as a Samaritan who became a Jewish proselyte. He is not mentioned by Irenaeus and his date is uncertain, but probably his work is to be assigned to the 1 Kings xx. 7-17; 2 Kings xxiii. 12-20, ed. by Dr C. Taylor in Fragments of the Books of Koh and according to the Translation of Aquila (Cambridge, 1897), and Ps. xc. 10-13; xci. 4-10, and parts of Ps. xiii. by Dr C. Taylor in Sayings of the Jewish Fathers (2nd ed., 1897).

1 According to the quintessence of Theodotion's date, Schiirer (Geschichte des jiidischen Volkes, Bd. ii. p. 324) argues very plausibly for his priority to Aquila on the grounds, (1) that Irenaeus mentions him before Aquila, and (2) that, after Aquila's version had been adopted by the Greek Jews, a work such as that of Theodotion would have been unnecessary. He therefore places Theodotion in the first stage towards the establishment of a Greek version which should correspond more closely with the Hebrew. Moreover, this theory affords the simplest explanation of its disappearance from Jewish tradition.

6 Only one MS. of the Septuagint version of Daniel has survived, the Codex Chaldaicus.
end of the 2nd century. His version was commended by Jerome as
having the sense of the original, and in that respect it forms a direct
contrast with that of Aquila. Indeed Dr Swete† thinks it probable
that he wrote with Aquila's version before him, and that in its efforts
to do that he made free use both of the Septuagint and of
Theodotion. As in the case of Aquila, our knowledge of the works of Theodotion
and Symmachus is practically limited to the fragments that have
been preserved through the collection of the Hexapla of Origen.
Origen's 'Hexapla'. The idea of collecting all the
existing Greek versions of the Old Testament with a view
to recovery of the original text of the Septuagint, partly by their aid
and partly by means of the current Hebrew text. He accordingly
arranged them in a verbal and critical arrangement, that is, in the following order:—(1) the Hebrew text; (2) the Hebrew translated
into Greek letters; (3) Aquila; (4) Symmachus; (5) the Septuagint;
and (6) Theodotion. In the Septuagint column he drew attention to
the fact that there were no Hebrew characters prefixed to the
obolus; but where the Septuagint had nothing corres-
ponding to the Hebrew text he supplied the omissions, chiefly
but not entirely from the translation of Theodotion, placing an asterisk
at the beginning of the interpolation; the close of the passage
where the obolus or the asterisk was prefixed was denoted by the
metabolus. That Origen did not succeed in his object of recovering
the original Septuagint is due to the fact that he started with the
false assumption that the original Septuagint text must be that
which coincided most nearly with the current Hebrew text.
Indeed, the result of his monumental labours has been to impede
rather than to promote the restoration of the genuine Septuagint.
For that which he placed between the Hebrew and the Greek text
of the Hexapla was not a mere arrangement of the Greek
literature, the Hexapla as a whole was far too large to be copied,
and the revised Septuagint text was published separately by Eusebius and
his pupil Lucian, the 4th century. During the same period two other
revisions were made, that of Hesychius which was current in Egypt, and that of Lucian which became the
the most famous, for his recension of Hesychius little is now
known. Traces of his revision are to be found in the Egyptian
version, especially the Codex Marchalianus, and in the quotations
of Cyril of Alexandria. Lucian was a priest of Antioch who was
born probably after 200, and whose text was probably used by
Dr Swete "was doubtless an attempt to revise the word (or
common term) of the Septuagint in accordance with the
principles of criticism which were accepted at Antioch." To Ceriani
is due the discovery that the text preserved by codices 10, 82, 88,
realises Lucian's recension; the same conclusion was
reached independently by Lagarde, who combined codex 118 with the
four mentioned above. As Field (Hexapla, p. 87) has shown,
this recension, which differs from that of Hesychius little,
its chief claim to critical importance rests on the fact that it
embraces readings not found in other MSS. of the Septuagint which
presumably a Hebrew original self-evidently superior in the passages
corresponding to the existing Masoretic text. 

Latin Versions.—Of even greater importance in this respect is the
Old Latin version, which undoubtedly represents a Greek
original prior to the Hexapla. The earliest form of the version
(to quote Dr Kennedy†) "to which we can assign a definite date,
name, and locality" is that used by Irenaeus; but even of Hesychius little
is now known. The view of many authorities this version was first produced at
Cambridge, but recent writers are inclined to regard Antioch as its
birthplace, a view which is supported by the remarkable agreement of
its readings with those of the early Syriac Hexapla. Unfortunately
the version is only extant in a fragmentary form, being preserved partly in MSS., partly in quotations of the
fathers. The non-canonical books of the Vulgate, however,
which were not published until after the work had been revised by
the fathers, and which are not in the Vulgate, yet represent the older version. It was not until after the 6th
century that the Old Latin was finally superseded by the Vulgate or Latin translation of the Old Testament made by Jerome during
the last quarter of the 4th century. This new version was translated
from the Hebrew, but Jerome also made use of the Greek versions,
more especially of Symmachus. His original intention was to revise
the Old Latin, and his two revisions of the Psalter, the Roman
text of the Hexapla, still survive. Of the Syriac Hexaplar
version, on the other hand, is extremely valuable for critical purposes. This Syriac translation of the Septuagint
column of the Hexapla was made by Paul, bishop of
Tella, at Alexandria in A.D. 616-617. Its value consists in
the extreme literalness of the translation, which renders
it possible to recover the Greek original with considerable certainty.
It has further preserved the critical signs employed by Origen as
well as many readings from the other Greek versions; hence it forms
the basis of the current Syriac version. The chief advantage of the
translation of Paul is that part of this work is still extant; the poetical and prophectical books
have been preserved in the Codex Ambrosianus at Milan (published
in Egypt, 1892) and in the Septuagint. The remaining versions of the Old Testament the most
important are the Egyptian, Ethiopic, Arabic, Gothic and Armenian,
though of these, except the Syriac, appear to have been made
through the medium of the Septuagint. 

AUTHORITIES.—Wellhausen-Bleek, Einleitung in das alte Testa-
S. R. Driver, Notes on Samuel (Oxford, 1890), Introd. §§ 3 ff.;
F. F. Bruce, Tales, at Alexandria in A.D. 616–617. Its value consists
in the text of the translation, which renders
it possible to recover the Greek original with considerable certainty.
It has further preserved the critical signs employed by Origen as
well as many readings from the other Greek versions; hence it forms
the basis of the current Syriac version. The chief advantage of the
translation of Paul is that part of this work is still extant; the poetical and prophetic
books have been preserved in the Codex Ambrosianus at Milan (published
in phorographity, and the
remaining
of these books have been collected by Lagarde in
his Bibliotheca Syriaca, etc.

Of the remaining versions of the Old Testament the most
important are the Egyptian, Ethiopic, Arabic, Gothic and Armenian,
though of these, except the Syriac, appear to have been made
through the medium of the Septuagint. 

Anglo-Saxon Version.—This is the version of the Vulgate
column of the Hexapla was made by Paul, bishop of
Tella, at Alexandria in A.D. 616-617. Its value consists in
the extreme literalness of the translation, which renders
it possible to recover the Greek original with considerable certainty.
It has further preserved the critical signs employed by Origen as
well as many readings from the other Greek versions; hence it forms
the basis of the current Syriac version. The chief advantage of the
translation of Paul is that part of this work is still extant; the poetical and prophetic
books have been preserved in the Codex Ambrosianus at Milan (published
in phorographity, and the
remaining
of these books have been collected by Lagarde in
his Bibliotheca Syriaca, etc.

Of the remaining versions of the Old Testament the most
important are the Egyptian, Ethiopic, Arabic, Gothic and Armenian,
though of these, except the Syriac, appear to have been made
through the medium of the Septuagint. 

3. Textual Criticism.

The aim of scientific Old Testament criticism is to obtain,
through discrimination between truth and error, a full apprecia-
tion of the literature which constitutes the Old Testament,
life of which it grew, and the secret of the
influence which these have exerted and still exert.
For such an appreciation many things are needed; and
the branches of Old Testament criticism are corre-
spondingly numerous. It is necessary in the first
place to correct the text of the original source, that is, the
the text of the translation, and to recover, so far as
possible, the text in its original form; this is the task of textual
 criticism, or as it is sometimes called in contradistinction to another branch,
Lower Criticism. It then becomes the task of critical exegesis
to interpret the text thus recovered so as to bring out the meaning
intended by the original authors. This Higher Criticism partakes of
two characters, literary and historical. One branch seeks to
determine the scope, purpose and character of the various books
of the Old Testament, the times in and conditions under which
they were written, whether they are severally the work of
a single author or of several, whether they embody earlier
sources and, if so, the character of these, and the conditions under which
they have reached us, whether altered and, if altered, how; this is
Literary Criticism. A further task is to estimate the value of
this literature as evidence for the history of Israel, to determine,
as far as possible, whether such parts of the literature as
are contemporary with the time described present correct, or whether

O.T. CRITICISM]
BIBLE

[O.T. CRITICISM]

in any respect one-sided or biased or otherwise incorrect, descriptions; and again, how far the literature that relates the story of long past periods has drawn upon trustworthy records, and how far it is possible to extract historical truth from traditions (such as those of the Pentateuch) that present, owing to the gradual accretions and modifications of intervening generations, a composite picture of the period described, or from a work such as Chronicles, which narrates the past under the influence of the conception that the institutions and ideas of the present must have been established and current in the past; or this falls under Historical Criticism, which, on its constructive side, must avail itself of all available and well-sifted evidence, whether derived from the Old Testament or elsewhere, for its presentation of the history of Israel—its ultimate purpose. Finally, by comparing the results of this criticism as a whole, we have to determine, by observing its growth and comparing it with others, the essential character of the religion of Israel.

In brief, then, the criticism of the Old Testament seeks to discover what the words written actually meant to the writers, what the events in Hebrew history actually were, what the religion actually was; and hence its aim differs from the dogmatic or homiletic treatments of the Old Testament, which have sought to discover in Scripture a grafted body of dogma or incentives to a particular type of life or the like.

Biblical criticism, and in some respects more especially Old Testament criticism, is, in all its branches, very largely of modern growth. This has been due in part to the removal of conditions unfavourable to the critical study of the evidence that existed, in part to the discovery of new evidences. The unfavourable conditions and the critical efforts which were made in spite of them can only be briefly indicated.

For a long time Biblical study lacked the first essential of sound critical method, viz. a critical text of the literature. Jewish study was exclusively based on the official Hebrew text, which was fixed, probably in the 2nd century B.C., and thereafter scrupulously preserved. This text, however, had suffered many obvious corruptions, and, probably enough, more corruption than can now, or perhaps ever will be, detected with certainty. The position of Christian (and Jewish Alexandrian) scholars was considerably worse; for, with rare exceptions, down to the 5th century, and practically without exception between the 5th and 15th centuries, their study was exclusively based on translations. Beneath the ancient Greek version, the Septuagint, there certainly underlay an earlier form of the Hebrew text than that perpetuated by Jewish tradition, and if Christian scholars could have worked through the version to the underlying Hebrew text, they would often have come nearer to the original meaning than their Jewish contemporaries. But this they could not do, and since the version, owing to the limitations of the translators, departs widely from the sense of the original, Christian scholars were on the whole kept much farther from the original meaning than their Jewish contemporaries, who used the Hebrew text; and later, after Jewish grammatical and philological study had been stimulated by intercourse with the Arabs, the relative disadvantages under which Christian scholarship laboured increased. Still there are not lacking in the early centuries A.D. important, if limited and imperfect, efforts in textual criticism. Origen, in his Hexapla, placed side by side the Hebrew text, the Septuagint, and certain later Greek versions, and drew attention to the variations; he thus brought together for comparison, an indispensable preliminary to criticism, the chief existing evidence to the text of the Old Testament. Unfortunately this great work proved too voluminous to be preserved entire; and in the form in which it was fragmentarily preserved, it even largely enhanced the critical task of later centuries. Jerome, perceiving the unsatisfactory position of Latin-speaking Christian scholars who studied the Old Testament at a double remove from the original—in Latin versions of the Greek—made a fresh Latin translation direct from the Hebrew text then received among the Jews. It is only in accordance with what constantly recurs in the history of Biblical criticism that this effort to approximate to the truth met with considerable opposition, and was for a time regarded even by Augustine as dangerous. Subsequently, however, this version of Jerome (the Vulgate) became the basis of Western Biblical scholarship. Henceforward the Western Church suffered both from the corruptions in the official Hebrew text and also from the fact that it worked from a version and not from the original, for a knowledge of Hebrew was rare indeed among Christian scholars between the time of Jerome and the 16th century.

But if the use of versions, or of an uncritical text of the original, was one condition unfavourable to criticism, another that was not less serious was the dominance over both Jews and Christians of unsound methods of interpretation—legal or dogmatic or allegorical. The influences of these can be traced as early as the Greek version (3rd century B.C. and later); allegorical interpretation is conspicuous in the Alexandrian Jewish scholar Philo (q.v.); it may be seen in many New Testament interpretations and the Old Testament (e.g. Gal. iii. 15; 1 Th. iv. 31-34), found a classical exponent in Origen, and, in spite of the opposition of the school of Antioch, pre-eminently of Theodore (d. A.D. 428), maintained its power virtually unbroken down to the Reformation. It is true that even by the most thorough-going allegorists the literal sense of Scripture was not openly and entirely disregarded; but the very fact that the study of Hebrew was never more than exceptional, and so early ceased to be cultivated at all, is eloquent of indifference in the original literal sense, and the very principle of the many meanings inherent in the sacred writings was hostile to sound interpretation; greater importance was attached to the "deeper" or "hidden" senses, i.e. to the various unreal interpretations, and when the literal sense conflicted with the dogmas or tradition of the Church its validity was wholly denied. The extraordinary ambiguity and uncertainty which allegorical interpretation tacitly ascribed to Scripture, and the ease with which horticultural as well as orthodox Christian scholars could be brought to believe that the Hebrew and Christian literal sense, early perceived, but instead of this leading to any real check on even wild subjectivity in interpretation and insistence on reaching the literal sense, it created an ominous principle that maintained much of its influence long after the supremacy of allegorism was overthrown. This is the principle that all interpretation of Scripture must be according to the Regula fidei—that all interpretation which makes Scripture contradict or offend the traditions of the Church is wrong.

The spirit and the age of humanism and the Reformation effected and witnessed important developments in the study of the Old Testament. It was still long before any considerable results were achieved; but in various ways the dogmatic and traditional treatment of Scripture was undermined; the way was opened for a more real and historical method. It must suffice to refer briefly to two points.

1. Ignorance gave place to knowledge of the languages in which the text of the O.T. was written. In 1504, the distinguished humanist, Johann Reuchlin, who had begun the study of Hebrew under a Jewish teacher about 1492, published a work entitled De Rudimentis Hebraicis containing a Hebrew lexicon and a Hebrew grammar. In 1514, a Swiss Jewish scholar, Uriel de Luxemburgo, who had largely profited from intercourse with Reuchlin, had published a brief introduction to the language. In 1514 the Complutensian Polyglot began to be printed and in 1522 was published. Various Jewish editions of the Hebrew Bible had appeared since 1477, entire since 1488; but this work contained the first Christian edition of the text. Certainly the editors did not intend hereby to exalt the original above the versions; for they placed the Vulgate in the centre of the page with the Hebrew on one side, the Greek on the other, i.e. as they themselves explained it, the Roman Church between the synagogue and the Greek Church, as Christ crucified between two thieves. Yet even so the publication of the new text, the Greek text, the Latin text, and the Hebrew text; henceforth the study of the original enters increasingly into Christian Biblical scholarship; it already underlay the translations which form so striking a feature of the 16th century. Luther's German version (1522) and Voragine's Italian version (1525) were both made from the Hebrew. At first, and indeed down to the middle of the 17th century, Jewish traditions and methods in the study of Hebrew dominated Christian scholars; but in the 17th and 18th centuries the study of other Semitic languages opened up that comparative linguistic study which was systematized and brought nearer to perfection in the 19th century.
(which also witnessed the opening up of the new study of Assyrian) by scholars such as Gesenius, Ewald, Olshausen, Renan, Noldeke, Stade and Driver. This has done much to render possible a more critical interpretation of the Old Testament.

2. An increasing stress was laid on the literal sense of Scripture. Theological expositors—Luther, Zwingli, Melancthon—frequently expressed themselves against the prevailing view of the manifold sense of Scripture, and in particular questioned the legitimacy of allegorical interpretations of the Book for the purposes of popular and practical exposition. The effort to get at and abide by the literal sense is characteristic of Calvin's extensive exegetical works. True, practice did not always keep pace with theory, and the literal sense had to yield if it came into conflict with the "Faith" of the allegorical expositors. Yet Calvin obscured the meaning of the Song of Songs, and any departure from it was severely condemned; just as Theodore of Mopsuestia drew down on himself for maintaining the literal sense the condemnation of the Second Council of Constantinople (381). So Sebastian Castellio objected in part to the same indiscrimation his expulsion from Geneva in 1544. Even in the 16th and 17th centuries scholars like Grotius and Michaelis met with violent opposition for the same cause.

But, however slowly and irregularly, the new conditions and the new spirit affected the study of the Old Testament. It became subject to the same critical methods which since the Renaissance have been applied to other ancient literatures. Biblical criticism is part of a wider criticism, but it has a unique place in it, and it is, in its kind, the purest. Biblical scholars adopted the various critical methods which as applied to other literatures have been proved valid, rather than themselves initiated them. The textual criticism of the classical literatures made way before the textual criticism of the Old Testament. They were desirous, and did not doubt, that any thorough and systematic application of Higher Criticism to any part of the Old Testament; Niebuhr's History of Rome (1811) preceded Ewald's History of Israel (1843-1850).

The fundamental principles of the Textual Criticism of the Old Testament are the same as those which apply to any other ancient text and need not be described here (see the article TEXTUAL CRITICISM). There are also, however, certain conditions peculiar to the text of the Old Testament. The significance of these and the extent to which they must govern the application of the general principles have even yet scarcely obtained full and general recognition. These, then, must be briefly described.

The earliest Hebrew MSS. of the Old Testament date from not earlier than the 9th century A.D., or nearly one thousand years after the latest parts of the Old Testament were written. These MSS., and the Hebrew Bibles as usually printed, contain in reality two perfectly distinct texts—the work of two different ages separated from one another by centuries: the one is a text of the Old Testament itself, the other a text of a later Jewish interpretation of the Old Testament. The text of the Old Testament consists of consonants only, for the alphabet of the ancient Hebrews, like that of their Moabite, Aramean and Phoenician neighbours, contained no vowels; the text of the interpretation consists of vowels and accents only—for vowel signs and accents had been invented by Jewish scholars between the 5th and 9th centuries A.D.; the text of the Old Testament is complete in itself and intelligible, though ambiguous; but the text of the interpretation read by itself is unintelligible, and only becomes intelligible when read with the consonants (under, over, or in which they are inserted) of the text of the Old Testament. But the fact that the later text makes use of the earlier to make itself intelligible in no way destroys the fact that it is as entirely distinct a work from the earlier as is any commentary distinct from the work which it purports to explain. The first task of Old Testament textual criticism, after the Hebraic text has been restored to prove the independence of these two texts, to gain general recognition of the fact that vowels and accents formed no part of the original Hebrew text of the Old Testament. The conflict that arose over this question in the Christian Church was prolonged and bitter—in part because it unfortunately became inflamed by the contending interests of Roman Catholic and Protestant. The coeval origin of consonants and vowels had indeed been questioned or denied by the earlier reformers (Luther, Zwingli, Calvin), but later, in the period of Protestant scholasticism and under the influence of one school of Jewish Rabbis, Protestant scholars in particular, and especially those of the Swiss school, notably the Buxtorfs, had committed themselves to the view that the vowels formed an integral and original part of the text of the Old Testament; and this they maintained with all the more fervency because the ambiguity of the consonants without the vowels was a troublesome fact in the way of the extreme Protestant doctrine of the inspiration, verbal infallibility and sufficiency of Scripture, while it was by no means unwelcome to Catholic theologians with their doctrine of the need for an authoritative interpretation. Still in the end it was due in large measure to the learning and argumentative power devoted to this subject by the French Protestant scholar, Louis Capell, and, amongst others, by the English Protestant scholar, Brian Walton, that by the end of the 17th century this particular controversy was practically at an end; criticism had triumphed, and the later origin of the vowels was admitted. Yet, as often happens, the influence of tradition lingered long after it had been proved to be false; thus the R.V., instead of being an independent translation of the Hebrew text, is intended (with rare exceptions, as e.g. in Ps. 129, where R.V. translates the Hebrew text and R.V. margin the Jewish interpretation) to be merely a translation of the Jewish interpretation; and to the present day it is usual, though obviously uncrirical and wrong, to describe perfectly legitimate translations of the Hebrew as "the Hebrew text," when certainly the words of the text were, in our present sense, only those provided by Jewish tradition, as based on emendation; even in the English edition of Haupt's Sacred Books of the Old Testament (see below) the possibility of this unfortunate misunderstanding is not altogether removed.

But the original text of the Old Testament long before it was combined with the text of the Jewish or Massoretic interpretation had already undergone a somewhat similar change, the extent of which was indeed far less, but also less clearly discoverable. This change consisted in the insertion into the original text of certain consonants which had come to be also used to express vowel sounds: e.g. the Hebrew consonant corresponding to also expressed the vowel o or u, the consonant k the vowel g, and so forth. For reasons suggested partly by the study of Semitic inscriptions, partly by comparison of passages occurring twice within the Old Testament, and partly by a comparison of the Hebrew text with the Septuagint, it is clear that the authors of the Old Testament (or at least most of them) themselves made use of these vowel consonants, but that in a great number of cases the vowel consonants that stood in our present text were inserted by transcribers and editors of the texts. Again, and for similar reasons, it is probable that in many cases, if not in all, the original texts were written without any clear division of the consonants into words. In view of all this, the first requisite for a critical treatment of the text of the Old Testament is to consider the consonants by themselves, to treat every vowel-consonant as possibly not original, and the existing divisions of the text into words as original only in those cases where they yield a sense better than any other possible division (or, at least, as good). Certainly all this brings us face to face with much ambiguity and demands increased skill in interpretation, but anything short of it falls short also of strict critical method. A perception of this has only been gradually reached, and is even now none too general.

Apart from these changes in the history of the text, there is, like all ancient texts, suffered from accidents of transmission, from the unintentional mistakes of copyists. This fact was, however, not sufficiently understood under the same dogmatic stress, denied by those scholars who maintained that the vowels were an integral part of the text. Here again we may single out Capellus as a pioneer in criticism, in his S. sacrae et variae quae in sacris V. T. libris occurrerent inuentionibus, written in 1634, much studied in MS. by scholars before its publication in 1650, and unavailingy criticised by Buxtorf the younger in his Anticriticum seu vindiciae veritatis hebraicae (1653). Capellus drew conclusions from such important facts as the occurrence of variations in the two Hebrew texts of passages found twice in the Old Testament itself, and the variations brought to light by a comparison of the Jewish and Samaritan texts of the Pentateuch, the Hebrew
text and the Septuagint, the Hebrew text and New Testament quotations from the Old Testament.

In order that the principles already perceived by Capellus might be satisfactorily applied in establishing a critical text, many things were needed; for example, a complete collation of existing MSS. of the Jewish text and of the Samaritan text of the Pentateuch, the establishing of a critical text of the Septuagint, a careful study of the several versions directed to determining when real variants are implied and what they are. Some of this work has been accomplished: much of it remains to be done.

The Hebrew MSS. were collated by Kennicott and de Rossi at the close of the 18th century, with sufficient thoroughness to justify the important conclusion that all existing MSS. reproduce a single recension. The Samaritan MSS. are still very imperfectly collated; the same is true of the Syriac and other versions except the Septuagint. In regard to the Septuagint, though the work is by no means complete, much has been done. For collection of material the edition of Holmes and Parsons (Oxford, 1798–1827), with its magnificent critical apparatus, is pre-eminent; the preparation of a similar edition, on a rather smaller scale but embodying the results of fresh and more careful collation, was subsequently undertaken by Cambridge scholars. These editions furnish the material, but neither attempts the actual construction of a critical text of the version. Some important contributions towards a right critical method of using the material collected have been made—in particular by Ewald, who has also opened up a valuable line of critical work, along which much remains to be done, by his restoration of the Lucianic recension, one of the three great recensions of the Greek text of the Old Testament which obtained currency at the close of the 3rd and beginning of the 4th centuries A.D.

More especially since the time of Capellus the value of the Septuagint for correcting the Hebrew text has been recognized; but it has often been used uncritically, and the correctness of the Hebrew text underlying it in comparison with the text of the Hebrew MSS., though still perhaps most generally underestimated, has certainly at times been exaggerated. It has only been possible here to indicate in the briefest way what is involved in the collection and critical sifting of the extant evidence for the text of the Old Testament, how much of the work has been done and how much remains; and with equal brevity it must suffice to indicate the position which faces the textual critic when all that can be done in this way has been done. In so far as it is possible to recover the Hebrew text from which the Greek version was made, it is possible to recover a form of the Hebrew text current about 480 b.c. in the case of the Pentateuch, some time before 100 b.c. in the case of most of the rest of the Old Testament. By comparison of the Hebrew MSS. it is not difficult to recover the recension which with few and unimportant variants they have perpetuated, and which may safely be regarded as differing but slightly from the text current and officially established before the end of the 2nd century B.C. By a comparison of these two lines of evidence we can approximate to a text current about 300 b.c. or later; but for any errors which had entered into the common source of these two forms of the text we possess no documentary means of detection whatsoever. The case then stands thus. Except by the obviously absurd assumption of the infallibility of copyists for the centuries before c. 300 b.c., we cannot escape the conclusion that errors lurk even when no variants now exist, and that such errors can be corrected, if at all, only by conjectural emendation. The dangers of conjectural emendation are well known and apparent; large numbers of such emendations have been ill-advised; but in the case of many passages the only alternative for the textual critic who is at once competent and honest is to offer such emendations or to indicate that such passages are corrupt and the means of restoring them lacking.

Conjectural emendations were offered by Capellus in the 17th, and by scholars such as C. F. Houbigant, Archbishop Secker, Bishop Lowth and J. D. Michaelis in the 18th century. Some of these have approved themselves to successive generations of scholars, who have also added largely to the store of such suggestions; conjectural emendation has been carried furthest by apologists of particular metrical theories (such as Bickell and Duhm) which do not accommodate themselves to the existing text, and by T. K. Cheyne (in Critica Biblica, 1893), whose restorations resting on a dubious theory of Hebrew history have met with little approval, though his negative criticism of the text is often keen and suggestive.

A model of the application of the various resources of Old Testament textual criticism to the restoration of the text is C. H. Cornill's Das Buch des Propheten Eschel (1886): outstanding examples of important systematic critical notes are J. Wellhausen's Der Text der Bücher Samuels (1871) and S. R. Driver's Notes on the Hebrew Text of the Books of Samuel (1890). Haupt's Sacred Books of the Old Testament, edited by various scholars, was designed to present, when complete, a critical text of the entire Old Testament with critical notes. The results of textual criticism, including a considerable number of conjectural emendations, are succinctly presented in Kittel's Biblia Hebraica (1906); but the text here printed is the ordinary Massoretic (vocalized) text. The valuable editions of the Old Testament by Baer and Delitzsch, and by Ginsburg, contain critical texts of the Jewish interpretation of Scripture, and therefore necessarily uncritical texts of the Hebrew Old Testament itself: it lies entirely outside their scope to give or even to consider the evidence which exists for correcting the obvious errors in the text of the Old Testament as received and perpetuated by the Jewish interpreters. See also the authorities mentioned in the following section.

(G. B. G.)*

We now pass on to consider the growth of literary and historic criticism, which constitute the Higher Criticism as already explained. Down to the Reformation conditions were unfavourable to such criticism; the prevailing dogmatic use of Scripture gave no occasion for inquiry into the human origins or into the real purport and character of the several books. Nevertheless we find some sporadic and tentative critical efforts or questions. The most remarkable of these was made outside the Church—a significant indication of the adverse effect of the conditions within; the Neo-platonist philosopher Porphyry in the 3rd century A.D., untramelled by church tradition and methods, anticipated one of the clearest and most important conclusions of modern criticism: he detected the incorrectness of the traditional ascension of Daniel to the Jewish captivity in Babylon and discerned that the real period of its composition was that of Antiochus Epiphanes, four centuries later. In the mind even of Augustine (Locutio in Jos. vi. 25) questions were raised by the occurrence of the formula "until this day" in Jos. iv. 9, but were stifled by a rather clever though wrong use of Jos. vi. 25; Abelard (Helissaes Problema, xli.) considers the problem whether the narrative of Moses's death in Deut. contains a prophecy by Moses or is the work of another and later writer, while the Jewish scholar Ibn Ezra (Abenezra), in a cryptic note on Deut. i. 1, which has been often quoted of late years, gathers together several indications that point, as he appears to perceive, to the post-Mosaic origin of the Pentateuch. Even rarer than these rare perceptions of the evidence of the quasi-historical books to their origin are such half-perceptions of the literary origin of the prophetic books as is betrayed by Ibn Ezra, who appears to question the Isaianic authorship of Is. xl. lviii., and by Photius, patriarch of Constantinople in the 9th century, who, according to Diodorf (Gesch. des A. T., 109), raises the question why the sixth chapter of Isaiah, containing the inaugural vision, does not stand at the beginning of the book.

Even after the Renaissance and the Reformation tradition continued influential. For though the Reformers were critical of the authority of ecclesiastical tradition in the matter of

*1 The Old Testament in Greek, by A. E. Brooke and N. McLean, vol. i. pt. 1 (1906).

*2 His arguments are stated briefly (and in order to be refuted) by Jerome in his commentary on Daniel.
the interpretation and use of Scripture, they were not immediately interested in literary and historical criticism, nor concerned to challenge: the whole body of traditional lore on these matters. At the same time we can see from Luther's attitude how the doctrine of the Reformation (unlike that of the Protestant scholastics who came later) admitted considerable freedom, in particular with reference to the extent of the canon, but also to several questions of higher criticism. Thus it is to Luther a matter of indifference whether or not Moses wrote the Pentateuch; the books of Chronicles he definitely pronounces less credible than those of Kings, and he considers that the books of Isaiah, Jeremiah and Hosea probably owe their present form to later hands. Carlstadt again definitely denied the Mosaic authorship of the Pentateuch and on this ground characterized the history of his own death and yet that Deut. xxxiv. cannot be separated from the rest of the Pentateuch. The later scholastic Protestant doctrine of verbal infallibility necessarily encouraged critical reaction and proved a widely extended retarding force far down into the 19th century. Nevertheless criticism advanced by slow degrees among individuals, now in the Roman Church, now in the number of those who sat loosely to the restrictions of either Roman or Protestant authority, and now among Protestant scholars and theologians.

It would be impossible to refer here even briefly to all these, and it may be more useful to select for somewhat full description, as showing what could be achieved by, and what limitations beset, even a critical spirit in the 17th century, a consideration of the origin of the Old Testament given by none but a single individual—Thomas Hobbes in his Leviathan 1 (published 1651) c. xxxiii. As far as possible this survey shall be cited verbatim:

"Who were the original writers of the several books of Holy Scripture has not been made evident by any sufficient testimony of other history, which is the only proof of matter of fact; nor can it be, by any means of reason, asserted that the author, who received the revealed truth, as saved to the light, could convince the truth, not of fact, but of consequence. The light therefore that must guide us in this question, must be that which is held out unto us from the books themselves; and this light, though it shew us not the author of every book, yet it is not unessential to give us knowledge of the time wherein they were written."

"And first, for the Pentateuch. . . We read (Deut. xxxiv. 6) concerning the sepulchre of Moses 'that no man knoweth of his sepulchre' unto this day: that is, to the day wherein those words were written. It is therefore manifest that these words were written after his interment. For it were a strange interpretation to say Moses spake of his own sepulchre, though by prophecy, that it was not written in the time of Moses, but afterwards. For we know that the last chapter only, not the whole Pentateuch, was written later, is met by Hobbes by reference to Gen. xii. 6 ('the Canaanite was then in the land') and Num. xlv. 14 (citation from the Latin Vulgate which states that the Red Sea and the Jordan were then both dry) and the conclusion reached that 'the five books of Moses were written after his time, though how long after is not so manifest.'"

"But though Moses did not compile those books entirely, and in the form we have them, yet he wrote all that which he is there said to have written: as, for example, the volume of the Law 'containing' as it seemeth 'in Deut. xxvi. 46, and this is that Law which 'having been lost, was long time after found again by Hilarius' alias Josua (2 Kings ii. 21)."

The books of Joshua, Judges, Ruth, Samuel are proved much later than the times recorded in them by the numerous passages which speak of customs, conditions, and traditions, that were not ancient. For instance, 'He, and a man servant, and his women servants, and all his flocks, and all his herds, and all the things that he had in the city, and in the fields, this man bought; and the men of the city, or the men of the country, he gave for them every one a slice of bread and a drink. '""(Josh. iv. v. 3). ""Whereas, it is said that 'Jonathan, and his son were priests to the tribe of Dan, until the day of the captivity of the land.'"

For Kings and Chronicles, 'besides the places which mention such benefit as the psalms, the writer saith, remained till his own days:' (Hobbes here cites thirteen from Kings, two from Chron.), 'it is argument sufficient that they were written after the captivity in Babylon, that the history of them is continued till that time: the late position of the events, the relation of them to the former history, and much more ancient than such books as make mention of and quote the register, as these books do in divers places."

Ezra and Nehemiah were written after, either during, or after the captivity, because the register, which is not a history but a philosophical poem, at an uncertain date. The Psalms were written mostly by David, but 'some of them after the return from the captivity, as the 131th and 136th, whereby it is manifest that the psalter was compiled and put into the form it now hath, after the return of the Jews from Babylon. The compilation of Proverbs is later than any of those which are the subject of the books of Judges and Sages and the other prophets of the time of Josiah and Ezekiel. Daniel, Haggai and Zechariah, who lived in the captivity, edited the prophecies ascribed to them. He concludes: 'But considering the inscriptions, or titles of their books, it is manifest enough that the whole Scripture of the Old Testament was set forth in the form we have it after the return of the Jews from the captivity in Babylon and before the time of Ptolemaeus Philadephus.'"

Except in strangely making Zephaniah contemporary with Isaiah, Hobbes' conclusions, in so far as they differ from the traditional views, have been confirmed by the more thorough criticism of subsequent scholars. But apart from the special conclusions, the opening and closing considerations contain clear and important statements which still hold good. No fresh discoveries since the time of Hobbes have furnished any 'testimony of other history' to the origin of the books of the Old Testament: this must still be determined by the statements and internal evidence of the Old Testament itself, and a deeper criticism has given to the final consideration that the Old Testament received its present form after the Exile a far greater significance than Hobbes perhaps guessed.

But the limitations of Hobbes' literary criticism judged from our present standpoint are great. The considerations from which he acutely and accurately draws far-reaching and important conclusions might be suggested by a very superficial examination of the literature; they involve, for example, no special philological knowledge. The effect of a deeper criticism has been (a) to give a more powerful support to some of Hobbes' conclusions; (b) to show that works (e.g. Ecclesiastes) whose traditional antiquity is left unquestioned by him are in reality of much more recent origin; (c) to eliminate the earlier sources or elements in the writings which Hobbes was content to date mainly or as a whole by their latest elements (e.g. Pentateuch, Judges, Kings), and thus to give to these earlier sources an historical value higher than that which would be safely attributed to them as indistinguishable parts of a later compilation.

Hobbes argues in the case of the Pentateuch that two authors are distinguishable—Moses and a much later compiler and editor—Hered, whose workDescricao politica (1671), c. viii., ix., had in general much in common with Hobbes, drew attention in particular to the confused mixture of law and narrative in the Pentateuch, the occurrence of duplicate narratives and chronological incongruities. Father Simon in his Histoire critique du Vieux Testament (1682) also argues that the Pentateuch is the work of more than one author, and makes an important advance towards a systematic analysis of the separate elements by observing that the style varies, being sometimes very curt and sometimes very copious "although the variety of the matter does not require it." But none of these makes any attempt to carry through a continuous analysis.

The first attempt of this kind is that of a French Catholic philologist, Jean Astruc. In a work published anonymously in 1755 under the title of Conjectures sur les monumens Astruc originaux dont il parloit que Mouys s'est servi pour composer le livre de la Genese, he argued that in Genesis and Ex. i. ii. Moses had used different documents, and that of these the two chief were distinguished by their use of different divine names—Elohim and Yahweh; by the use of this clue he gave a detailed analysis of the passages belonging to the several documents. Astruc's criteria were too slight to give to all the details of his analysis anything approaching a final analysis; but later criticism has shown that his criteria, so far as they went, were valid, and his results, broadly speaking, sound though incomplete: and, moreover, they have abundantly justified his really important fundamental theory that the documents used by the compiler of the Pentateuch have been incorporated so much as they lay before him that we can get

---

1 In what follows the actual quotations are from his English work; some of the summaries take account of the brief expansions in his later Latin version.

[J.T. CRITICISM

behind the compiler to the earlier sources and thus push back the evidence of much of the Pentateuch beyond the date of its compilation to the earlier date of the sources. In identifying the compiler with Moses, Astruc failed to profit from some of his predecessors: and the fact that he held to the traditional (Mosaic) origin of the Pentateuch may have prevented him from seeing the similar facts which would have led him to continue his analysis into the remaining books of the Pentateuch.

For subsequent developments, and the fruitful results of documentary analysis as applied to the Pentateuch and other composite books, which cannot be dealt with in any detail here, reference must be made to the special articles on the books of the Old Testament.

The year of the publication of Astruc’s book saw also the publication of Bishop Lowth’s De sacr. poes. Hebraeorum: later Louth. Lowth published a new translation of Isaiah with notes (1778). Lowth’s contribution to a more critical appreciation of the Old Testament lies in his perception of the nature and significance of parallelism in Hebrew poetry, his discernment of the extent to which the prophetic books are poetical in form, and in his treatment of the Old Testament as the expression of the thought and emotions of a people—in a word, as literature. Both Lowth’s works were translated and became influential in Germany.

In spite of these earlier achievements, it is J. G. Eichhorn who has, not without reason, been termed the “founder of modern Eichhorn. Old Testament criticism.” Certainly the publication of his Einleitung [Introduction to the Old Testament], in 1780-1783, is a landmark in the history of Old Testament criticism. An intimate friend of Herder, himself keenly interested in literature, he naturally enough treats the Old Testament as literature—like Lowth, but more thoroughly: and, as an Oriental scholar, he treats it as an Oriental literature. In both respects he was to be widely followed. His Introduction, consisting of three closely packed volumes dealing with textual as well as literary criticism, is the first comprehensive treatment of the entire Old Testament as literature. Much of the voluminous detailed work in this and other works is naturally enough provisionally, but in the Introduction there emerge most of the broad conclusions of literary criticism (sometimes incomplete) which, after more than a century of keen examination by scholars unwilling to admit them, have passed by more or less general consent into the number of historical certainties or high probabilities. With his wide linguistic knowledge Eichhorn perceived that the language alone (though he also adduces other considerations) betrays the late origin of Ecclesiastes, which he places in the Persian Period (538-332 B.C.): Canticles, too, preserves linguistic features which are not of the Solomonic age. He analyses significant stylistic peculiarities such as occur, e.g., in Isaiah xxiv, xxvii. For various reasons (here following Koppe, who just previously in additions to his translation of Lowth’s Isaiah had shown himself the pioneer of the higher criticism of the book of Isaiah) he argues that in our Isaiah are many oracles not the work of this prophet.” In other directions the still powerful influence of theories of Eichhorn. He maintains the exilic origin of parts of Daniel, though he is convinced (here again in part by language) of the later origin of other parts. His Pentateuchal criticism is limited by the tradition of Mosaic authorship: but even within these limits he achieves much. He carries through, as Astruc had done, the analysis of Genesis into (primarily) two documents; he draws the distinction between the Priests’ Code, of the middle books of the Pentateuch, and Deuteronomy, the people’s law book; and admits that even the books that follow Genesis consist of different documents, many incomplete and fragmentary (whence the theory became known as the “Fragment-hypothesis”), but all the work of Moses and some of his contemporaries.

Other literary critics of the same period or a little later are Alex. Geddes, a Scottish Catholic priest, who projected, and in part carried out (1792-1800), a critically annotated new translation of the Old Testament, and argued therein that the Pentateuch ultimately rests on a variety of sources partly written, partly oral, but was compiled in Canaan probably in the reign of Solomon; K. D. Igen, the discoverer (1798) that there were two distinct documents in Genesis using the divine name Elohim, and consequently that there were three main sources in the books, not two, as Astruc and Eichhorn had conjectured; and J. S. Vater, the elaborator of the “Fragment-hypothesis.”

But the next distinct stage is reached when we come to De Wette, whose contributions to Biblical learning were many and varied, but who was pre-eminent in historical criticism. De Wette. He carried criticism beyond literary analysis and literary appreciation to the task of determining the worth of the documents as records, the validity of the evidence. His peculiar qualities were conspicuous in his early and exceedingly influential work—the Beiträge zur Einleitung in das Alte Testament (1806-1807). In the introduction to vol. ii he carefully analyses the principles of sound historical method and the essentials of a trustworthy historical record. These principles he applied to the Old Testament, firstly to the Books of Chronicles, and then to the Pentateuch. The untrustworthiness of Chronicles—briefly admitted by Luther—he proved in detail, and so cleared the way for that truer view of the history and religion of Israel which the treatment of Chronicles as a trustworthy record of the past hopelessly obscured. In the criticism of the Pentateuch his most influential and enduring contributions to criticism are his proof that Deuteronomy is a work of the 7th century B.C., and his insistence that the theory of the Mosaic origin of all the institutions described in the Pentateuch is incompatible with the history of Israel as described in the historical books, Judges, Samuel and Kings.

Strong in historical criticism, De Wette was weak in historical construction. But what he failed to give, Ewald supplied, and if more of De Wette’s than of Ewald’s work still stands to-day, that is but an illustration of the melancholy fact that in history negative criticism is surer than positive construction. But Ewald’s History of the People of Israel (1843-1859) was the first great attempt to synthesize the results of criticism and to present the history of Israel as a great reality of the past. By the force of his wide learning and even more of his personality, Ewald exercised for long an all-pervading and almost irresistible influence. He closes one epoch of Old Testament criticism; by his influence he retards the development of the next. Before passing to the new epoch it must suffice to make a simple reference to the philological work of Genesius and Ewald, which assisted a sounder exegesis and so secured for later criticism a more stable basis.

The next stage brings us to the critical theories or conclusions which at first gradually and then rapidly, in spite of the keenest criticisms directed against them both by those who clung more or less completely to tradition and by the representatives of the earlier critical school, gained increasing acceptance, until to-day they dominate Old Testament study. The historico-critical starting-point of the movement was really furnished by De Wette: but it was Vatke who, in his Biblische Theologie wissenschaftlich dargestellt (1835), first brought out its essential character. The fundamental peculiarity of the movement lies in the fact that it is a criticism of what is supreme in Israel—its religion, and that it has rendered possible a true appreciation of this by showing that, like all living and life-giving systems of thought, belief and practice, the religion of Israel was subject to development. It seized on the prophetic element, and not the ceremonial, as containing what is essential and unique in the religion of Israel. In literary criticism its fundamental thesis, stated independently of Vatke and in the same year by George in Die älteren jüdischen Feste, and in a measure anticipated by Reuss, who in 1832 was maintaining in his academical lectures that the prophets were older than the Law and the Psalms, and more recent than both, is that the chronological order of the three main sources of the Hexateuch is (1) the prophetic narratives (JE), (2) Deuteronomy, (3) the Priestly Code (P), the last being post-exilic. This entirely reversed the prevailing view that P with its exact details and developed ceremonial and sacrificial system was at once the earliest portion
of the Pentateuch and the *Grundschri* or foundation of the whole—a view that was maintained by Ewald and, though with very important modifications, to the last by A. Dillmann (d. 1894). Inherent in this view of religious development and the new critical position were far-reaching changes in the literary, historical and religious criticism of the Old Testament; these have been gradually rendered clear as the fundamental positions on which they rest have been secured by the manifold work of two generations of scholars.

Nearly a generation passed before Vitke's point of view gained any considerable number of adherents. This is significant. In part it may fairly be attributed to the retarding influence of the school of Ewald, but in large part also to the fact that Vitke, a pupil of Hegel, had developed his theory on *a priori* grounds in accordance with the principles of Hegel's philosophy of history. It was only after a fresh and keener observation of facts that the new theory made rapid progress. For that, when it came, was due to the work of Graf (a pupil of Reuss, whose *Geschichte der Bücher des Alten Testaments* appeared in 1866); to the Dutch scholar Kuenen, who, starting from the earlier criticism, came over to the new, made it the basis of his *Religion of Israel* (1869-1870), a masterly work and a model of sound method, and continued to support it by a long series of critical essays in the *Theologisch Tijdschrift*; and to Wellhausen, who displayed an unrivalled combination of grasp of details and power of historical construction: his *Prolegomena zur Geschichte Israels* was published in 1878 and translated into English in 1883; the history itself, *Israelitische u. jüdische Geschichte*, followed twenty years later, after much further critical work had been done in the meantime. Not a little also was due to Colenso (The *Penta- tech ... critically examined*, pt. i., 1862), who, though he never entirely accepted the new position, contributed by his searching analysis of the unreality of P's narrative to the formation (for example, in the mind of Kuenen) or rationalisation of the judgment on that work which is fundamental to the general theory.

This sketch of the critical movement has now been brought down to the point at which the comprehensive conclusions which still dominate Old Testament study gained clear expression and were shown to be drawn from the observation of a large body of facts. It does not fall within the scope of this article to examine the validity of these conclusions, nor even to notice the various subsidiary or consequential conclusions. Nor again is it possible to survey the more special developments of literary criticism which have later emerged, amongst which one of the most important has been the radical examination of the prophetic writings introduced and developed by (amongst others) Stade, Wellhausen, Duhm, Cheyne, Marti.1

The starting-point of this newer criticism of the prophets is the clearer practical recognition of the fact that all pre-exilic prophecy has come down to us in the works of post-exilic editors, and that for the old statement of the problem of the prophetic books—What prophecies or elements in Isaiah, Jeremiah and the rest are later than these prophets?—is to be substituted the new critical question—From these post-exilic collections how are the pre-exilic elements to be extracted? Bound up with this question of literary criticism is the very important question of the origin and development of the Messianic idea.

But two things, the extent of the influence of criticism and the relation of archaeology and criticism, yet remain for consideration, in the course of which it will be possible just to indicate some other problems awaiting solution.

It is one thing for scholars to reach conclusions: it is another for these conclusions to exercise a wide influence in the Churches and over general culture. In the 16th century we find obiter *dicta* of the Reformers challenging traditional opinions on the origin and character of the Old Testament; in the 17th century, among certain isolated scholars, elementary critical surveys of the whole field, which exercised, however, no extensive influence. Nor was it till late in the 18th century that criticism seriously challenged the dominance of the Protestant scholastic treatment of the Old Testament on the one hand, and the rough and ready, uncritical explanations or depreciations of the Rationalists on the other. But Eichhorn's *Introduction* appealed to more than technical scholars: its influence was great, and from that time forward criticism gradually or even rapidly extended its sway in Germany. Very different was the case in England; after Geddes and Lowth, at the close of the 18th, till far down into the 19th century, the attitude even of scholars (with rare exceptions) was hostile to critical developments, and no independent critical work was done. Fuesy indeed studied under Eichhorn, and in his *Historical Enquiry into the probable causes of the Rationalist Character lately predominant in German Theology* (1838-1839) speaks sympathetically of the attitude of the Reformers on the question of Scripture and in condemnation of the later Protestant scholastic doctrine; but even in this book he shows no receptivity for any of the actual critical conclusions. Eichhorn and his successors, and subsequently threw the weight of his learning against critical conclusions—naturally in his *Commentary on Daniel* (1864). Dean Stanley owed something to Ewald and spoke warmly of him, but the Preface to the *History of the Jewish Church* in which he does so bears eloquent testimony to the general attitude towards Old Testament criticism in 1862, of which we have further proof in the almost unanimous disapprobation and far-spread horror with which Colenso's *Pentateuch*, pt. i., was met on its publication in the same year.

From 1869 T. K. Cheyne worked indefatigably as a resourceful pioneer, but for many years, in view of the prevailing temper, with "extreme self-suppression" and "willingness to concede to tradition all that could with any plausibility be conceded" (Cheyne, *Origin of the Psalter*, p. 15); more especially is his influence observable after 1890, when he published his Bampton Lectures, the *Origin of the Psalter*, a work of vast learning and keen penetration, without restraint on the freedom of his judgment and always stimulating to students and fellow-workers, though he did not administer the lamp for no man. From about 1880 the prevailing temper had changed; within a decade of this date the change had become great; since then the influence of Old Testament criticism has grown with increased acceleration. The change in the former period with regard to a single point, which is however typical of many, is briefly summed up by Dr Cheyne: "In 1880 it was still a heresy to accept with all its consequences the plurality of authorship of the Book of Isaiah; in 1890 to a growing school of church-students this has become an indubitable fact" (*Origin of the Psalter*, xv.). By 1906 this plurality of authorship had become almost a commonplace of the market. Many, particularly of late, have contributed to the wide distribution, if not of the critical spirit itself, yet at least of a knowledge of its conclusions. To two only of the most influential is it possible to make more definite reference—to W. Robertson Smith and S. R. Driver. From 1875 onwards Smith contributed to the 4th edition of the *Encyclopaedia Britannica* a long series of important articles, which, together with the articles of Cheyne, Wellhausen and others, made that which was an important factor in the change which was to pass over English thought in regard to the Bible; in 1878, by his pleadings in the trial for heresy brought against him on the ground of these articles, he turned a personal defeat in the immediate issue into a notable victory for the cause which led to his condemnation; and subsequently (in 1880), in two series of lectures, afterwards published 2 and widely read, he gave a brilliant, and, as it proved, to a rapidly increasing number a convincing exposition of the criticism of the literature, history and religion of Israel, which was already represented in Germany

1 See particularly B. Stade, *Geschichte des Volkes Israel* (1877-1888); J. Wellhausen, *Die kleinen Propheten* (1892); B. I. Duhm, *Jesaja* (1892); T. K. Cheyne, *Introduction to the Book of Isaiah* (1895); K. Marti, *Jesaja* (1900), and *Das Dodekopropheten* (1904).

2 The *Old Testament in the Jewish Church* (1881); *The Prophets of Israel* (1882).
by Wellhausen and in Holland by Kuenen. In 1891 Dr Driver published his Introduction to the Literature of the Old Testament (6th ed., 1897), less popular in form than Smith's lectures, it was a more systematic and comprehensive survey of the whole field of the literary criticism of the Old Testament. The position of the author as regius professor of Hebrew at Oxford and canon of Christ Church in succession to Pusey, and his well-established reputation as a profound Hebrew scholar, commanded wide attention; the qualities of the book itself—its marked sobriety, its careful discrimination between the differing degrees of probability attaching to various conclusions and suggestions, and in general its soundness of method—rapidly extended the understanding of what Old Testament criticism is and commanded acceptance of the well-established conclusions.

No less rapid has been the change in America during the same period, nor less numerous the scholars well equipped to pursue the detailed investigation involved in critical study or those who have shown ability in popular presentations of the critical standpoint. Pre-eminent amongst these is C. A. Briggs, whose influence has been due in part to a large and varied body of work (Biblical Study, 1883, and many articles and volumes since) and in part to his organization of united critical, international and interconfessional labour, the chief fruits of which have been his work on the Loci Classicorum (under Gesenius, as edited by F. Brown, one of the most eminent of American scholars, S. R. Driver and himself), and the International Critical Commentary. Other important works in which English and American scholars have co-operated are the Encyclopaedia Biblica (1899-1901) and Hastings' Bible Dictionary (1898-1904)—the latter less radical, but yet on the whole based on acceptance of the fundamental positions of Vatke, Graf, Wellhausen. Between either of these and Smith's Dictionary of the Bible (1863) yawns a great gulf. Space forbids any attempt to sketch here the special growth of criticism in other countries, such as France, where the brilliant genius of Renan was in part devoted to the Old Testament, or within the Roman Catholic Church, which possesses in Père Lagrange, for example, a deservedly influential critical scholar, and in the Revue Biblique an organ which devotes much attention to the critical study of the Old Testament.

Rapid and extensive as has been the spread of critical methods, there have not been lacking anticitrice. Many of these have been not only apologetic, but unscholarly; that is, however, not the case with all. In Dr James Orr's learned work, The Problem of the Old Testament considered with reference to Recent Criticism (1899), the characteristic of the modern school of criticism is described as the fundamental positions of the now dominant school of criticism. In view of extensive misconception occasioned by many of these anticitrice, it needs to be pointed out that terms like "criticism," "higher criticism," "critics" are often loosely used: criticism is a method, its results are many. Again, many of the results or conclusions of criticism are mutually independent, and others are interrelated and depend for their validity on the validity of others. For example, among the generally or largely accepted critical conclusions are these: (1) Moses is not the author of the whole Pentateuch; (2) Isaiah is not the author of Is. xl.-lxvi.; (3) the book of Daniel was written in the 2nd century B.C.; (4) the Priestly Code is post-exilic; (5) most of the Psalms are post-exilic. Now 1, 2, 3 are absolutely independent—if 1 were proved false, 2 and 3 would still stand; and so with 2 and 3: so also 2 and 3 could be proved false without in any way affecting the validity of 4. On the other hand, if 1 were disproved, 4 would immediately fall through, and the strength of 5 would be weakened (as it would also by the disbelief of 2), because the argument for the date of many Psalms is dependent on the independence of these. The significance of these varies greatly according as the Priestley Code is held to be early or late. In view of the number of critical conclusions and the mutual independence of many of them, "higher criticism" can only be overthrown by proving the application of criticism to the Old Testament to be in itself unlawful, or else by proving the falseness or inconclusiveness of all its mutually independent judgments one by one. On examination, the authors of anticitrice are generally found to disown, tacitly or openly, the first of these alternatives; for example, Prof. Sayce, who frequently takes the field against the "higher criticism," and denies, without however, disproving, the validity of the literary analysis of the Hexateuch, nevertheless himself asserts that "no one can study the Pentateuch . . . without perceiving that it is a compilation, and that its author, or authors, has made use of a large variety of older materials," and that "it has probably received its final shape at the hands of Ezra" (Early History of the Hebrews, 129 and 134). This is significant enough; Prof. Sayce, the most brilliant and distinguished of the "anti-critics," does not really reoccupy the position of the "able and pious men" of the mid-19th century, to whom "even to speak of any portion of the Bible as a history" was "an outrage upon religion" (Stanley, Jewish Church, Preface); these may still have pious, but they have no longer scholarly successors. Prof. Sayce travels farther back, it is true, but on critical lines: he abandons the Pentateuchal criticism of the 19th century, to reoccupy the critical position of Hobbes, Spinoza and Simon in the 17th century, whether reasonable or not must here be left an open question.

Briefly, in conclusion it remains to consider the relation of Archaeology to Criticism, partly because it is frequently asserted in the loose language just discussed that Archaeology has overthrown Criticism, or in particular the "higher criticism," and partly because Archaeology has stimulated and forced to the front certain important critical questions.

More especially since the middle of the 19th century the decipherment of Egyptian and Assyrian inscriptions and systematic excavation in Palestine and other parts of the East have supplied a multitude of new facts bearing more or less directly on the Old Testament. What has been the general effect of these new facts on traditional theories or critical conclusions?

(1) Literary Criticism.—No discovery has yielded any direct testimony as to the authorship of any book of the Bible, or to the date or mode of its composition. Any documentary analysis of the Pentateuch may be right or wrong; but archaeology contributes nothing either one way or another as to the answer. On the other hand, archaeology has in some cases greatly strengthened the critical judgment that certain writings (e.g. Daniel, the book of Judges in Genesis) are not contemporaries with the events described.

(2) Historical Criticism.—Here the gain has been more direct; e.g. the Assyrian inscriptions have furnished independent evidence of the relations of certain Hebrew kings (Ahab, Jehu, Ahaz) with the Assyrians, and thus supported more or less completely the evidence of the Old Testament on these points: they have also served to clear up in part the confused chronology of the Hebrews as given in the books of Kings. But above all archaeology has immensely increased our knowledge of the nations among which Israel was placed, and of the political powers which from time to time held Palestine in subjection. In this way archaeology has greatly helped to bring the history of Israel into relation with the history of the ancient East, and in so doing has raised important questions as to the origin of Hebrew culture. For example, the recent discovery of the Code of Khammurabi, which contains some remarkable resemblances to the Pentateuchal codes, raises the question of the relation of Hebrew to Babylonian law. On the other hand, there are certain great historical questions in which archaeology has been greatly affected by criticism, but on which archaeology has hitherto shed no light. For example, much as archaeology has increased our knowledge of the conditions obtaining in Palestine before the Hebrew invasion, it has so far contributed nothing to our knowledge of the Hebrew nation before that time beyond the statement in the now famous stile of Merenptah (Minephtah) (c. 1270 B.C.), discovered in 1866, "Yisra'el is desolated, its seed is not," and a few possible but vague and uncertain
allusions to particular tribes. It has contributed nothing whatsoever to our knowledge of any Hebrew individual of this period, and consequently what elements of history underlie the stories in Genesis, in so far as they relate to the Hebrew patriarchs, must still be determined, if at all, by a critical study of the Old Testament. The story in Gen. xiv. is no exception to this statement: archaeology has made probable the historic reality of Chedorlaomer, which some critics had previously divined; it has not proved the historical reality of the patriarch Abraham or the part played by him in the story, which some critics, whether rightly or wrongly, had questioned. The Dutch scholar Kosters called in question the return of the Jews in the days of Cyrus; his view, adopted by many, has hardly obtained, as yet at all events, the weight of critical judgment: here again, unfortunately, archaeology at present is silent.

(3) Criticism of Religion.—Here, perhaps, archaeology has contributed most new material, with the result that religious terms, ideas, institutions, once supposed to be peculiar to Israel, and hence to be common to them and other nations; in some cases, moreover, priority clearly does not lie with the Hebrews, as, for example, in the case of the materials (as distinct from the spirit in which they are worked up) of the stories of Creation and the Flood. Of late, too, it has been much argued, and often somewhat confidently maintained, that Hebrew monotheism is derivative from Babylonian monotheism.

This and similar questions, leading up to the ultimate and supreme question—Wherein does lie the uniqueness of Israel's religion?—are among those which will require in the future renewed examination in the light of a critical study alike of the Old Testament and of all the relevant material furnished by archaeology. Archaeology has not yet found the key to every unopened door; but it has already done enough to justify the supposition that if criticism had not already disintegrated the traditional theories of the Old Testament, archaeology in the latter half of the 19th century would itself have initiated the process.

LITERATURE.—Much of the details and results of criticism and the special literature will be found in the articles in the present work on the several books of the Old Testament. To the works already mentioned we may add L. Dieterich, Geschichte des Alten Testamentes in der Christlichen Kirche (1860); C. A. Briggs, General Introduction to the Study of Holy Scripture (1889); G. A. Smith, Modern Criticism and the Preaching of the Old Testament (1901) (these for the history of Criticism (or more generally of Old Testament study); T. C. Skeat, Orders of the Testament (pp. 1-247, biographical sketches of critical scholars since the middle of the 18th century: pp. 248-372, criticism of Driver's Introduction). As already indicated, the exposition of Literary Criticism in English is Driver's Introduction to the Literature of the Old Testament. For the general principles of Historical Criticism see Ch. V. Langlois and Ch. Seignobos, Introduction to the Study of History (Eng. trans., 1898), with which it is interesting to compare De Wette's brief discussion referred to in the article.

A sense of the importance of a fixed standard of chronology was only acquired gradually in the history of the world. Nations in a primitive state of civilization were not, and are not, conscious of the need. When the need began to be felt events were probably at first dated by the reignal years of kings; the reigns of successive kings were then arranged in order, and grouped, if necessary, in dynasties, and thus a fixed standard was gradually constructed. Particular states also not infrequently introduced fixed eras, which obtained a more or less extensive currency, as the era of the first Olympiad (776 b.c.), of the foundation of Rome (753 b.c.), and of the Seleucidae at Antioch (312 b.c.), which is followed by the Jewish author of the first book of Maccabees. Some of the earliest documents which we possess are dated by the year in which some noticeable event took place, as in contract-tablets of the age of Sargon of Agadé. To avoid any possibility of overstating the case, it is necessary to refer to the fact that Thothmosis (Thothmes) III. in the 16th century b.c. mentions two Palestinian places named respectively Jacobel and Josaphel, and Sheshonk in the 10th century b.c. mentions another called "the Field of Abram." From these names alone it is impossible to determine whether the places derived their names from individuals or tribes.

II. 28

(Akkad) (3800 b.c. or, according to other authorities, 3800 b.c.), "In the year in which Sargon conquered the land of Amurru [the Amorites]"; or, "In the year in which Samsu-ditana [c. 1950 b.c.] made the statue of Marduk": Is. vi. 1 ("In the year of King Uzziah's death"), xiv. 28, xx. 1, are examples of this method of dating found even in the Old Testament. In process of time, however, the custom of dating by the regnal year of the king became general. The Babylonians and Assyrians were probably the first to construct and employ a fixed chronological standard; and the numerous contract-tablets, and list of kings and yearly official records, discovered within recent years, afford striking evidence of the precision with which they noted chronological details. Biblical chronology is, unfortunately, in many respects uncertain. Prior to the establishment of the monarchy the conditions for securing an exact and consecutive chronology did not exist; the dates in the earlier period of the history, though apparently in many cases precise, being in fact added long after the events described, and often (as will appear below) resting upon an artificial basis, so that the precision is in reality illusory. And after the establishment of the monarchy, though the conditions for an accurate chronology now existed, errors by some means or other found their way into the figures; so that the dates, as we now have them, are in many cases at fault by as much as two to three decades of years. The exact dates of events in Hebrew history can be determined only when the figures given in the Old Testament can be checked and, if necessary, corrected by the contemporary monuments of Assyria and Babylonia, or (as in the post-exilic period) by the knowledge which we independently possess of the chronology of the Persian kings. In the following parts of this article the chronological character of each successive period of the Old Testament history will be considered and explained as far as the limits of space at the writer's disposal permit.

(1) From the Creation of Man to the Exodus.—In the whole of this period the chronology, in so far as it consists of definite figures, depends upon that part of the Pentateuch which is called by critics the "Priestly Narrative." The figures are in most, if not in all cases artificial, though the means now fail us of determining upon what principles they were calculated. It is also to be noted that in the Samaritan text of the Pentateuch, and in the LXX., the figures, especially in the period from the Creation to the birth of Abraham, differ considerably from those given in the Hebrew, yielding in Sam. a lower, but in the LXX. a much higher total. The following tables will make the details clear:

The figures in parentheses indicate the entire ages assigned to the several patriarchs; these are generally the same in the three texts. The Sam., however, it will be noticed, makes in three cases the father's age at the birth of his oldest son less than it is in the Heb. text, while the LXX. makes it in several cases as much as 100 years higher, the general result of these differences being that the total in the Sam. is 340 years less than in the Heb., while in the LXX. it is 606 years more. The names, it need hardly be remarked, belong to the prehistoric period, and equally with the figures are destitute of historical value.

Or, according to some MSS., 167.
The variations are analogous to those under (1), except that here the birth-years of the patriarchs in both Sam. and LXX differ more consistently in one direction, being, viz., almost uniformly higher by 100 years. It has been much debated, in both cases, which of the three preserves the original figures. In (2) it is generally agreed that the Heb. does this, the figures in Sam. and LXX. having been arbitrarily increased for the purpose of lengthening the entire period. The majority of scholars hold the view of (2) (except (1); but Dillmann gives here the preference to the figures of the Sam. The figures, of course, in no case possess historical value: accepting even Ussher's date of the Exodus, 1491 B.C., which is earlier than is probable, we should obtain from them for the creation of man 4157 B.C., or (LXX.) 5328, and for the confusion of tongues, which, according to Gen. xi. 1-9, immediately followed the Flood, 2501 B.C., or (LXX.) 3066 B.C. But the monuments of Egypt and Babylonia make it certain that man must have appeared upon the earth long before either 4157 B.C. or 5328 B.C. and numerous inscriptions, written in three distinct languages—Egyptian, Sumerian and Babylonian—are preserved dating from an age considerably earlier than either 2501 B.C. or 3066 B.C. The figures of Gen. v. and xi. thus merely indicate the manner in which the author of the Priestly Narrative—and probably to some extent tradition before him—picture the course of these early ages of the world's history. The ages assigned to the several patriarchs (except Enoch) in Gen. v. are much greater than those assigned to the patriarchs mentioned in Gen. xi., and similarly the ages in Gen. xi. 10-18 are higher than those in Gen. xi. 10-26; it is thus a collateral aim of the author to exemplify the supposed gradual diminution in the normal years of human life.

The Babylonians, according to Berosus, supposed that there were ten antediluvian kings, who they declared had reigned for the portentous period of 432,000 years: 432,000 years, however, it has been ingeniously pointed out by Oppert (Gott. Geقن. Nachrichten, 1877, p. 205 fl.), = 86,400 Iusturo, while 156 years (the Heb. date of the Flood) = 86,400 weeks (1666-72 X 23) and 23 years being = 8955 days + 5 intercalary days = 8,960 days = 12,000 weeks; and hence the inference has been drawn that the two periods have in some way been developed from a common basis, the Hebrews taking as their unit a week, where the Babylonians took a Iustrum of 5 years.

(5) From the Call of Abraham to the Exodus.

From the Call of Abraham to the birth of Isaac (Abraham being then aged 100, Gen. xxi. 5) 25 years

Age of Isaac at the birth of Esau and Jacob (Gen. xxv. 26) 60...

Age of Jacob when he went down into Egypt (Gen. xlvii. 9) 130...

The period of the Patriarchs' sojourn in Canaan was thus...

But the period of the Israelites' sojourn in Egypt, according to Ex. xii. 40, 41, was...

We thus get—

From the Call of Abraham to the Exodus (Heb. text)...

From the Flood to the Call of Abraham (Heb. text)...

From the Creation of Man to the Flood (Heb. text)...

From the Creation of Man to the Exodus (Heb. text)...

On these figures the following remarks may be made:—

(i) In Genesis the chronology of the Priestly Narrative ("P") is not consistent with the chronology of the other parts of the book ("JE"). Three or four illustrations will suffice: (a) The author of Gen. xii. 10-20 evidently pictures Sarai as a comparatively young woman, yet according to P (xii. 4, xvii. 17) she was 65 years old. (b) In Gen. xxi. 15 it is clearly implied that Ishmael has been married by his mother, yet according to P (xii. 16, xvi. 5, 8) he must have been at least 15 years old. (c) In Gen. xxvii. Isaac is to all appearances described (cf. ver. 2), yet according to P (xxv. 26, xxvi. 34, xxxv. 28) he survived for eighty years, dying at the age of 180. Ussher and others, arguing back from the dates in xlvi. 9, xlv. 6, xlix. 41, infer that Jacob's flight to Haran took place in his 77th year. This reduces the 80 years to 43 years, though that is scarcely less incredible. It involves, moreover, the incongruity of supposing that thirty-seven years elapsed between Esau's marrying his Hittite wives (xxvi. 34) and Rebekah's expressing her apprehensions (xxvii. 46) lest Jacob, then aged seventy-seven, should follow his brother's example. (d) In Gen. xlv. 20 Benjamin is described as a "little one"; in P, almost immediately afterwards (xlvi. 21), he appears as the father of ten sons; for a similar anomaly in xlvii. 12, see the Oxford Hexateuch, i. p. 258.

(ii) The ages to which the various patriarchs lived (Abraham, 175; Isaac, 180; Jacob, 147), though not so extravagant as those of the antediluvian patriarchs, or (with one exception) as those of the patriarchs between Noah and Abraham, are much greater than is at all probable in view of the structure and constitution of the human body. (iii) The plain intention of Ex. xii. 40, 41 is to describe the Israelites as having dwelt in Egypt for 430 years, which is also in substantial agreement with the earlier passage, Gen. xv. 13 ("shall sojourn in a land that is not theirs... and they shall afflict them 400 years"). It does not, however, accord with other passages, which assign only four generations from Jacob's children to Moses (Ex. vi. 16-20; Num. xxvi. 5-9; cf. Gen. xvi. 16), or to five to Joshua (Josh. vii. 1); and for this reason, no doubt, the Sam. and LXX. read in Ex. xii. 40, "the sojourning of the children of Israel in the land of Egypt, and in the land of Canaan, was 430 years," reducing the period of the sojourn in Egypt to half that stated in the Hebrew text, viz. 215 years. This computation attains currency among the later Jews (Josephus and others; cf. the 400 years of Gal. iii. 17). The forced and unnatural rendering of Ex. xii. 40 in the A.V. (contrast R.V.), which was followed by Ussher, is intended for the purpose of making it possible. From the facts that have been here briefly noted it must be evident how precarious and, in parts, how impossible the Biblical chronology of this period is. (iv) It has been observed as remarkable that 2666, the number of years (in the Hebrew text) from the Creation of Man to the Exodus, is, in round numbers, just two-thirds of 4000; and the fact has suggested the inference that the figure was reached by artificial computation.

The Date of the Exodus.—Is it possible to determine this, even approximately, upon the basis of external data? (i) The correspondence between the Egyptian governors established in different parts of Palestine and the Egyptian kings Amenhotep (Amenophis) III. and IV. of the 18th dynasty, which was discovered in 1887 at Tel el-Amarna, makes it evident that Palestine could not yet have been in the occupation of the Israelites. It was still an Egyptian province, and the Babylonian language, in which the correspondence is written, shows that the country must have been for a considerable time past, before it came into the possession of Egypt, under Babylonian

1. Shem, the father of Arphaxad, is aged 100 at the time of the Flood, and lives for 600 years.
2. Disregarding the "two years" of Gen. xi. 10; see v. 2, vii. 17.
3. Taking account of the reading of LXX. in Ex. xlii. 40.
4. See further Driver's essay in Hogarth's Authority and Archaeology (1899), pp. 32-34; or his Book of Genesis (1904, 7th ed., 1909), p. xxii. II.
influence. Now one of the kings, who corresponds with Amen-\hph\otep IV., is Burns-Burasri (Burna-burasri), king of Babylon, and Egyptologists and Assyriologists are agreed that the date of these monarchs was c. 1400 B.C. The conquest of Canaan, consequently, could not have taken place till after 1400 B.C.

(ii.) It is stated in Ex. i. 11 that the Israelites built in Egypt for the Pharaoh two store-cities, Pithom and Ramses. The excavations of M. Naville have, however, shown that Ramses II. of the 19th dynasty was the builder of Pithom; and though the other city has not at present been certainly identified, its name is sufficient to show that he was its builder likewise. Hence the Pharaoh of the Exodus is commonly supposed to have been Ramses (Rameses II.)'s successor, Merenptah (Mipnepath).

Egyptian chronology is unfortunately imperfect; but Professor Petrie, who has paid particular attention to the subject, and who assigns the reign of Amen-hoph IV. to 1383-1365 B.C., assigns Ramses II. to 1300-1274 B.C.\(^1\) In Merenptah's fifth year the Delta was invaded by a formidable body of Libyans and other foes\(^2\) and it has been conjectured that the Israelites took the opportunity of escaping under the unsetlement that was thus occasioned.

The alternative dates for Ramses II.: Maspero, The Struggle of the Nations (1897), p. 440. c. 1320-1255; Breasted (1906), 1292-1275; Meyer (1909), 1310-1244. Attempts have been made to identify the Khabiri, who are mentioned often in the Tel el-Amarra letters as foes, threatening to invade Palestine and bringing the Egyptian supremacy to an end, with the Hebrews. This, however, has been pointed out, might then be placed under Amen-hoph II. (1448-1420 B.C.; Breasted; 1449-1423, Petrie), the successor of Thothmes, and more time would be allowed for the events between the Exodus and the time of David (c. 1000), which, if the date given above be correct, have been thought to be unduly compressed (see Orr in the Expositor, March 1897, p. 161 ff.); but there are difficulties attaching to this view, and it has not been adopted generally by scholars. There may be some ultimate connexion between the Khabiri and the Hebrews; but the Khabiri of the Tel el-Amarra letters cannot be the Hebrews who invaded Canaan under Joshua.\(^1\)

The mention of Israel on the stele of Merenptah, discovered by Petrie in 1896 ("Israel [Yisrael] is desolated; its seed [or fruit] is not"); is too vague and indefinite in its terms to throw any light on the question of the Exodus. The context speaks of places in or near Canaan; and it is possible that the reference is to Israelite clans who either had not gone down into Egypt at all, or had already found their way back to Palestine. See Hogarth's Authority and Archaeology, pp. 62-65.

2. From the Exodus to the Foundation of the Temple (in the fourth year of Solomon, 1 Kings vi. 1).—In the chronological note, 1 Kings vi. 1, this period is stated to have consisted of 480 (LXX., 440) years. If 480 (LXX. 440) years is held to be the period of oppression and independence mentioned in the Book of Judges (judges iii. 8, 11, 14, 30, iv. 3, v. 31, vi. 1, viii. 28, ix. 22, x. 2, 3, 8, xii. 7, 9, 11, 14, xiii. 1, xv. 20, xvi. 31) be added up, they will be found to amount to 410 years; to these must be added further, in order to gain the entire period from the Exodus to the foundation of the Temple, the 40 years in the wilderness, 2 years under Joshua and the elders (Judges ii. 7, 20 LXX. 20 years' judgments of Eli (1 Sam. iv. 18), the 20 or more years of Samuel (1 Sam. vii. 2, 15), the 9 years of Saul (the two years of 1 Sam. xiii.), the 40 years of David (1 Kings ii. 11), and the first 40 years of Solomon, i.e. 144++x+y years, in all 554 years, + two unknown periods denoted by \(x\) and \(y\)—in any case considerably more than the 480 years of 1 Kings vi. 1. This period might no doubt be reduced to 480 years by the supposition, in itself not improbable, that some of the judges were local and contemporaneous; the suggestion has also been made that, as is usual in Oriental chronology, it is the relationship of form to function that is the beginning of each judge's rule being reckoned, not from the victory which brought him into power, but from the death of his predecessor; we should in this case obtain for the period from the Exodus to the foundation of the Temple 440++x+y years,\(^3\) which if 30 years be assigned conventionally to Joshua and the elders, and 10 years to Saul, would amount exactly to 480 years. The terms used, however ("and the land had rest forty years," illi. 11, similarly, ill. 30, v. 18, viii. 28), seem hardly to admit of the latter supposition; and even if they did, it would still be scarcely possible to maintain the correctness of the 480 years: it is difficult to harmonize with what, as we have seen, appears to be the most probable date of the Exodus; it is moreover, open itself to the suspicion of having been formed artificially, upon the assumption that the period in question consisted of twelve generations\(^4\) of 40 years each.

In the years assigned to the different judges, also, the frequency of the number 40 (which certainly appears to have been regarded by the Hebrews as a round number) is suspicious. On the whole no certain chronology of this period is at present attainable.\(^3\)

3. From the Fourth Year of Solomon to the Captivity of Judah.

—During this period the dates are both more abundant, and also, approximately, far more nearly correct, than in any of the earlier periods; nevertheless in details there is still much uncertainty and difficulty. The Books of Kings is a compilation made at about the beginning of the Exile, and one object of the compiler was to give a consecutive and complete chronology of the period embraced in his work. With this purpose in view, he not only notes carefully the length of the reign of each king in both kingdoms, but also (as long as the northern kingdom existed) brings the history of the two kingdoms into relation with one another by equating the commencement of each reign in either kingdom with the year of the reign of the contemporary king in the other kingdom.

The following are examples of the standing formulae used by the compiler for the purpose:—"In the twentieth year of Jeroboam king of Israel began Asa to reign over Judah. And forty and one years reigned he in Jerusalem" (1 Kings xv. 9, 10). "In the third year of Asa king of Judah began Baasha the son of Ahilud to reign over all Israel in Tirzah (and reigned twenty and four years" (ibid. ver. 33).

In these chronological notices the lengths of the reigns were derived, there is every reason to suppose, either from tradition or from the state annals—the "book of the chronicles of Israel" (or "Judah"), so constantly referred to by the compiler as his authority (e.g. 1 Kings xv. 23, 31, xvi. 5); but the "chronologies"—i.e. the corresponding dates in the contemporary reigns in the other kingdom were derived, it is practically certain, by computation from the lengths of the successive reigns. Now in some cases, perhaps, in the reigns of the kings themselves, in other cases in the computations based upon them, errors have crept in, which have vitiated more or less the entire chronology of this period. The nature of these errors can be demonstrated in two ways: (1) the chronology of the two kingdoms is not consistent with itself; (2) the dates of various events in the history, which are mentioned also in the Assyrian inscriptions, are in serious disagreement with the dates as fixed by the contemporary Assyrian chronology.

(1) That the chronology of the two kingdoms is inconsistent with itself is readily shown. After the division of the kingdom the first year of Jeroboam in Israel coincides, of course, with the first year of Rehoboam in Judah; and after the death of Jehoram of Israel and Ahaziah of Judah in battle with Jechu (2 Kings ix. 24, 27), the first year of Jehu in Israel coincides similarly with the first year of Athaliah in Judah: there are thus in history the periods of the two kingdoms two fixed and certain synchronisms. Now,

3. Namely, 40 years in the wilderness; Joshua and the elders (Judges ii. 7, 2 years; Othniel (iii. 11), 40 years; Ehud (iii. 30), 80 years; Samson (xvi. 27); Jephthah and five minor judges (x. 2, 3, xii. 9, 11, 14, 17); 76 years; Samson (xvi. 31), 20 years; Eli (1 Sam. iv. 18), 40 years; Samuel (vi. 2), 20 years; Saul, 3 years; David, 40 years; and Solomon's first year—17 years.

The "300 years" of Judges xi. 26 agrees very nearly with the sum of the years (namely, 319) given in the preceding chapters for the successive periods of oppression and independence. The verse occurs in a long insertion (xi. 12-28) in the original narrative; and the figure was most probably arrived at by computation upon the basis of the present chronology of the book.

1 The real Biblical date, Ussher in Gen. xi. 26 interpolating 60 years, because it is said in Acts vii. 4 that Abraham left Haran after his father Terah's death (Gen. xi. 32), and also (as explained above) interpreting wrongly Ex. xii. 40.
3 Petrie's dates, Hist. of Egypt, vol. i. (ed. 5. 1903), pp. 26, 30, 323, 251, 252; vol. iii. (1905), pp. 2, 235, 281-7. 290-300. Other authorities, however, assign considerably lower dates for the dynasties prior to the 18th. Thus Braem (Hist. of Egypt, 1906, pp. 22 ft., 221, 597) agrees with Ed. Meyer in giving, for reasons which cannot be here explained, for the beginning of the 1st dynasty c. B.C. 3400, for the 4th dynasty c. B.C. 2900-2750, and for the rule of the Hyksos c. B.C. 1650-1580; and in his Reisen in Sinai, 1906, p. 175. Petrie proposes for Menes B.C. 3150, and for the 4th dynasty B.C. 4731-4454. See Egypt (Chronology).
4 So Sayce, Rogers (Hist. of Bab. and Ass., 1900, i. 318 f.) and others. The date rests upon a statement of Nabu-nâ'id, that Sargon's son, Naram-Sin, reigned 3200 years before himself. Lehmann holds that there are reasons for believing that the engraver, by error, put a stroke too many, and that 2200 should be read instead of 3200.
5 The real Biblical date. Rogers, i. 375-375. Many monuments and inscriptions of other kings in Babylonia, between 4000 and 2000 B.C. are also known.
6 The lists of the Babylonian and Assyrian kings are not continuous; and before 1907, from the data then available (see the discussion in Rogers, op. cit. i. 312-348), Khammurabi, the sixth king of the first Babylonian dynasty, was commonly referred to such dates as 2376-2333 B.C. (Sayce) or 2285-2224 B.C. (Johns). But inscriptions recently discovered, by showing that the second dynasty was partly contemporaneous with the first and the third, have proved that these dates are too high: see L. W. King, Chronicles Concerning Early Bab. Kings (1907), i. 93-110; and the article BABYLONIA, Chronology. The date B.C. 2130-2088 is that adopted by Thureau-Dangin, after a discussion of the subject, in the Journal des Savants, 1908, p. 199; and by Ungnad in the Orient. Lit.-zeitung, 1908, p. 13, and in Gressmann's Altorientalische Texte und Bilder zum A.T. (1909), p. 103.
7 The dates of the kings are, in most cases, those given by Kautzsch in the table of the Hist. of the Literature of the O.T. (tr. by Taylor, 1898), pp. 167 ff.; see also A. R. S. Kennedy, "Samuel" in the Century Bible (1903), p. 31. The dates given by other recent authorities seldom differ by more than three or four years.
8 The figures after a king's name indicate the number of years assigned to his reign in the O.T. For Saul, see 1 Sam. xii. 1, R.V
9 The date of Sheshonq depends on that fixed for Rehoboam. Petrie places the accession of Rehoboam in 937 B.C.

1 If these dates are correct, there must be some error in the ages assigned to Ahaz and Hezekiah at their accession, viz. 20 and 25 respectively, for it would otherwise follow from them that Ahaz, dying at the age of [20+8=28], left a son aged 25! The date 728 for Hezekiah’s accession rests upon the assumption that of the two inconsistent dates in 2 Kings xviii. 10, 13, the one in ver. 10 (which places the fall of Samaria in Hezekiah’s 6th year) is correct; but some scholars (as Wellhausen, Kamphausen, and Stade) suppose that the date in ver. 10 (which places Sennacherib’s invasion in Hezekiah’s 14th year) is correct, and assign accordingly Hezekiah’s accession to 715. This removes, or at least mitigates, the difficulty referred to, and leaves more room for the reigns of Jotham and Ahaz; but it requires, of course, a corresponding reduction in the reigns of the kings succeeding Ahaz.

2 Breasted’s dates for these three kings (Hist. of Egypt, 1905, p. 601) are: Shabaka 712–700; Shabata 700–688; Taharqa 688–663.

*Palestine now becomes a province, first of the empire of Alexander, and afterwards of that of one or other of Alexander's successors.*

- 332. The Jews submit to Alexander the Great.
- 320. Ptolemy Lagi gains possession of Palestine, which, with short interruptions, continues in the hands of the Ptolemics until 198.
- 312. Beginning of the era of the Seleucidae (reckoned from the time when Seleucus Nicator, Alexander's former heavy cavalry officer, finally established himself in the satrapy of Babylonia. He founded Antioch as his capital, 300 B.C.).
- 305. Ptolemy Lagi assumes the title of king.
- 198. Antiochus the Great, king of Syria (225-187), defeats Ptolemy Epiphanes at Panias (Bâniyas, near the sources of the Jordan), and obtains possession of Palestine.
- 175-164. Antiochus Epiphanes, king of Syria (Dan. xi. 21-45).
- 168. Antiochus' attempt to suppress the religion of the Jews (1 Macc. i. 41-65; cf. Dan. vii. 8, 21, 24-26, viii. 9,14, xii. 10-12). Public worship suspended in the Temple for three years.
- 167. Rise of the Maccabees (1 Macc. ii.).
- 166-165. Victories of Judas Maccabaeus over the generals of Antiochus (1 Macc. iii.-iv.).
- 165. Re-dedication of the Temple on 25th Chislev (December), 1 Macc. iv. 52-61.
- 142-135. Simon, elder brother of Judas (1 Macc. xiii.-xvi.).
- 105-104. Aristobulus I. (son of Hyrcanus), king.
- 104-78. Alexander Jannaeus (brother of Aristobulus), king.
- 78-69. Salome (Alexandra), widow of Alexander Jannaeus.
- 69. Aristobulus II. (son of Alexandra).
- 65. Capture of Jerusalem by Pompey. Palestine becomes a part of the Roman province of Syria.

- 666 B.C.1 The accuracy of these canons can in many cases be checked by the full annals which we now possess of the reigns of many of the kings—of Ashur-nazir-abal or Assur-nasir-pal (885-860 B.C.), Shalmaneser II. (860-825), Tiglath-pileser IV. (745-727), Sargon (722-705), Sennacherib (704-751), Esarhaddon (684-668), and Assurbanipal or Assur-bani-pal (668-646). Thus from 893 B.C. the Assyrian chronology is certain and precise. Reducing now both the Assyrian and Biblical dates to a common standard, and adopting for the latter the computations of Ussher, we obtain the following singular series of discrepancies:

<table>
<thead>
<tr>
<th>Dates according to Ussher's Chronology.</th>

</tr>
<tr>
<td>Invasion of Judah by Sennacherib in Hezekiah's fourteenth year</td>
<td>721</td>
</tr>
</tbody>
</table>

Manifestly all the Biblical dates earlier than 733-732 B.C. are too high, and must be considerably reduced: the two events, also, in Hezekiah's reign—the fall of Samaria and the invasion of Sennacherib—which the compiler of the book of Kings treats as separated by an interval of eight years, were separated in reality by an interval of twenty-one years.4

1 See George Smith, *The Assyrian Eponym Canon* (1875), pp. 29 ff.; 57 ff.; *Schrader, Keilinschriftliche Bibliothek* (transcriptions and translations of Assyrian and Babylonian inscriptions), i. (1889), pp. 204 ff.
2 It may be explained here that the dates of the Assyrian and Babylonian kings can be reduced to years b.c. by means of the so-called "Canon of Ptolemy," which is a list of the Babylonian and Persian kings, with the lengths of their reigns, extending from Nabonassar, 747 B.C., to Alexander the Great, drawn up in the 2nd century A.D. by the celebrated Egyptian mathematician and geographer Ptolemy; as the dates b.c. of the Persian kings are known independently, from Greek sources, the dates b.c. of the preceding Babylonian kings can, of course, be at once calculated by means of the Canon. The recently-discovered contemporary monuments have fully established the accuracy of the Canon.
3 Or, in any case, between 734 and 732; see Rost, *Die Keilinschrifttexte Tiglath-pileser III*. 1893, pp. xii., 39, 81, with the discussion, pp. xxii., xxiv., xxxv.-xxxvi.
4 This interval does not depend upon a mere list of Eponym years; we have in the annals of Sargon and Sennacherib full particulars of the events in all the intervening years.
Much has been written on the chronology of the kings and events; many endeavours have been made to readjust the Biblical figures so as to bring them into consistency with themselves and at the same time into conformity with the Assyrian dates. But, though the fact of there being errors in the Biblical figures is patent, it is not equally clear at what points the error lies, or how the available years ought to be redistributed between the various reigns. It is in any case evident that the accession of Jehu and Athaliah must be brought down from 884 to 842 B.C.; and this will involve, naturally, a corresponding reduction of the dates of the previous kings of both kingdoms, and of course, at the same time, of those of Solomon, David and Saul. The difficulty is, however, greatest in the 8th century. Here, in Judah, from the accession of Athaliah to the accession of Ahaz, tradition gives 143 years, whereas, in fact, there were but 106 years (842–736); and in Israel, from the death of Menahem to the fall of Samaria, it gives 31 years, whereas from 735 (assuming that Menahem died in that year) to 722 there are actually only 16 years. The years assigned by tradition to the reigns in both kingdoms in the middle part of the 8th century B.C. have thus to be materially reduced. But in the following period, from the fall of Samaria in 722 to the capture of Jerusalem by the Chaldaeans in 586, the Biblical dates, so far as we can judge, are substantially correct. (See further the table above.)

4. From the Destruction of Jerusalem in 586 to the close of the Old Testament History.—Here, though it is true that there are events in the Biblical history which are not fully or unambiguously dated, there is otherwise no difficulty. The lengths of the reigns of Nebuchadrezzar and his successors on the throne of Babylon, and also, after the conquest of Babylon, of Cyrus and the following Persian kings, are known from the "Canon of Ptolemy," referred to above, the particulars in which, for the earlier part of this period, are also confirmed by the testimony of the monuments.

See, for further information on the subject, the article CHRONOLOGY, and the heading in the Encyclopaedia Biblica, cols. 773–799, with the literature referred to on col. 819 (especially the writings of Nöleke, Wellhausen, and Ramphhausen there mentioned). (S. R. D.)

(B) NEW TESTAMENT

1. Canon.

The New Testament is the collection of the Sacred Books of Christians. It forms in the Bible the distinctive possession of Christians, just as the Old Testament is the collection of Sacred Books which Christians share with Jews. Every term in the definition is significant and has a history. There are, first, the Books; then, the Collection; then, the Sacred Volume, complete as such in idea, though not as yet complete in its actual contents; and, lastly, the Sacred Volume in its full dimensions, as it has come down to us.

There is a double development, of quality and of quantity; of quality, as to the estimate formed of the books, their increasing recognition as sacred; and of quantity, by which the books so recognized were gradually brought up to their present number. Our duty will be to describe this double process, and we shall do so under the four heads: (a) The Growth of a specifically Christian Literature; (b) The Collection of the Books into a single volume, made up of ordered groups; (c) The investing of this volume with the character of a Sacred Book; and (d) The gradual settlement by which the volume assumed its present dimensions, neither less nor more.

The model throughout was the Old Testament. The result was attained when there was a definite volume called the New Testament by the side of the earlier volume called the Old Testament, complete like it, and like it endowed with the attributes of a Sacred Book. This is the consummation towards which events had been steadily moving—not at first consciously, for it was some time before the tendencies at work were consciously realized—but ending at last in the complete equation of Old Testament and New, and in the bracketing together of both as the first and second volumes of a single Bible. This is the process that we shall have to describe. And because the process before us is the gradual assimilation of New Testament and Old Testament, we shall have to include at each step all that bears upon this. For instance, at starting, it will not be enough for us simply to tell the story how the Books of the New Testament came to be written, but we shall have to point out what there was about them which fitted them to be what they afterwards became, what inherent qualities they possessed which suggested the estimate ultimately put upon them; in others words, how they came to be not only a collection of Christian books, but a collection of Christian sacred books, or part of a Bible.

(a) The Growth of a Christian Literature. 1. The Pauline Epistles.—The Bible of Jesus and His disciples was the Old Testament. And both Jesus and His disciples were to all appearance content with this. It was probably two full decades after the death of Christ before there were any specifically Christian writings at all. The first generation of Christians was not given to writing. There was not only no obvious reason why it should write, but there was a positive reason why it should not write. This reason lay in the dominant attitude of Christians, which was what we call "eschatological." The first generation of Christians lived on the daily expectation that Christ would return from heaven. The truth is, that not only were Christians expecting (as we say) the Second Coming of the Messiah, but what they expected was the coming of the Messiah, as all Jews conceived of Him, was a superhuman being; and His First Coming as a man among men did not count as really Messianic. The whole first generation of Christians looked intently for His coming in power and great glory, which they believed to be near at hand. In such a state of mind as this there was no motive for seeking permanence by writing. Men who imagined that they might at any moment be caught up to meet the Lord in the air were not likely to take steps for the instruction of the generations that might come after them.

Hence the first Christian writings were no deliberate product of theologians who supposed themselves to be laying the foundation of a sacred volume. They were not an outcome of the dominant tendencies of the time, but they arose rather in spite of them, in the simplest way, just from the practical needs of the moment.

It was thus that St Paul came to write his two epistles to the Thessalonians; the oldest Christian documents that we possess. By this time he was launched on his missionary labours; he had founded a number of churches, and he was going on to found others. And these earliest epistles are just the substitute for his personal presence, advice which he took occasion to send to his converts after he had left them. There are a few indications that he had sent similar communications to other churches before, but these have not been preserved. Indeed the wonder is—and it is a testimony to the strength of the impression which St Paul left upon all with whom he came into contact—that these missionary letters of his should have begun to be preserved so soon.

Both Epistles to the Thessalonians have for their object to calm somewhat the excited expectations of which we have spoken.

The first Epistle treats exactly the prominent features in the situation, when it reminds the Thessalonians how they had "turned unto God from idols, to serve a living and true God, and to wait for his Son from heaven," who would deliver them from the wrath to come (1 Thess. i. 9, 10). The turning from idols was of course peculiar to the Gentile communities, but the waiting for the Messiah from heaven was common to all Christians, whatever their origin. In this we may take the epistle as typical of the state of the whole Church at the time. There is also another important passage which shows why, in spite of its natural and occasional character, the epistle exhibits the germs of that essential quality which caused all the books of the New Testament to be so highly estimated. The apostle again reminds his readers how they had received his preaching "not as the word of men, but as it is in truth, the word of God," which showed its power by the way in which it took hold of those who believed in it (1 Thess. ii. 13). The reference is of
course primarily to the spoken word, but the written word had the same qualities as the spoken. It was the deep impression made by these which prepared Christians generally to accept the apostolic writings as inspired, and therefore sacred. There is no greater mistake than to suppose that the estimate formed by the early Church of its Bible was a merely arbitrary verdict, imposed by an external authority; it was the expression, and the natural expression (though following certain prescribed lines), of its real sense of the value and fundamentally divine origin of the writings which it treasured.

Nearest in character to the Thessalonian Epistles are the two to Corinth, which have perhaps an interval of a year and a half between them. When 1 Corinthians was written, the attitude of the Church was still strongly eschatological (1 Cor. i. 7, 8, iii. 13-15, vii. 26, 29-31, xv. 25, 26, 51-54, xvi. 23). The thoughts of men were still set upon the near approach of the end, the troublesome times that would issue in the break-up of the existing order and the return of Christ to introduce a new era. There was no idea of constructing a systematic theology; Christ was still the Jewish Messiah, and His Coming was conceived of as the Jews conceived of the coming of the Messiah, as a great supernatural event transforming the face of things and inaugurating the reign of God. In view of this approaching revolution, both the Church and the world were regarded as living from hand to mouth. It was useless to attempt to found permanent institutions; everything was provisional and for the moment. And yet, even under these conditions, some practical arrangements had to be made. The epistle is taken up with matters of this kind; either the apostle is reproving disorders and abuses actually existing in the Church, and almost sure to exist in a young community that had just adopted a novel method of life and had as yet no settled understanding of the principles involved in it; or else he is replying to definite questions put to him by his converts. In all this the epistle is stillgethers it is evidently not so much a letter as a personal message to the Church, and it only gets the title of a letter just when it comes above the level of a letter, through the extraordinary penetration, force, enthusiasm and elevation of feeling that the apostle throws into his treatment of more or less ordinary topics. He can never rest until he has carried up the question of the moment to some higher ground of faith or conduct. It is in this incidental and digressive way that we get the description of the Gospel in i. 18-ii. 16; of the Christian ministry in chs. iii., iv.; of the principle of consideration for others in ch. ix.; of the Sacrament of the Lord’s Supper in chs. x., xi.; of Christian love in ch. xiii.; of the Resurrection and its consequences in ch. xv.

2 Corinthians is even more a product of the situation: it is even more taken up with personal relations. No epistle sheds more light on St Paul’s character as a man—so mobile, so tactful, so tender and affectionate, and yet so statesmanlike and so commanding. If doctrinal utterances occur from time to time, they are in every case incidental and unpremeditated.

The development of doctrine in St Paul’s epistles is due in part to the gradual subsiding of the eschatological temper, but even more to the growth of controversy. A crisis had arisen in Galatia owing to the invasion of the churches, which St Paul had founded there, by reactionary Jews. This called forth a letter1 from St Paul, who felt himself compelled to grapple at close quarters with teaching which he saw cut at the very root of his own. He was thus led both to clear up for himself and to state for the sake of others his whole conception of soteriology—his answer to the question how was man to be set right before God. That was a large part, and at the moment the most crucial part, of the whole problem of religion.

Two or three years later (c. a.d. 55-59) St Paul was bent on paying a visit to Rome. He was not going there straight, but to Jerusalem first. He knew that he could only do this at the

1 The date of this epistle is rather uncertain. Something depends upon the vexed question as to the identity of the Galatian churches. The epistle may be placed conjecturally early in the stay at Ephesus (c. a.d. 52-53). It is to be noted that the chronological grouping of the epistles by minute comparison of style is apt to be deceptive; resemblances of this kind are due more to similarity of subject than to proximity in date.

imminent peril of his life. It seemed very doubtful whether he would accomplish his desire. And therefore he took the opportunity to send to the Romans what is really a summing up, not of the whole of Christianity, but of that side of Christianity which the preceding controversy had brought into special relief. He states his case as part of a larger question still—a question that inevitably became pressing at that particular time—as to the entire religious relation of Jew and Gentile.

These years of shock and conflict could not fail to have marked effect upon the shaping of definite Christian doctrine. They drew attention away from the future to the present, and to the past as leading up to the present. They compelled a man like St Paul to theorize: thought was driven inward; it was made to search for foundations, to organize itself and knit together part with part. And the impulse thus given continued. It showed itself strongly in the epistles of the next group, especially Ephesians and Colossians. These epistles took their form at once from a natural progression of thought and from a new perception of the first of these classes, and the second be would, which perverted Christian practice and impaired the supremacy of Christ by placing other beings or entities by His side. The apostle meets this by renewed emphasis on the central position of Christ; and he at the same time carries a step farther his conception of the unity of the Church, as embracing both Jew and Gentile. The predominance of this somewhat recondite teaching gave to these epistles even more the character of treatises, which in the case of Ephesians is further enhanced by the fact that it is probably a circular letter addressed not to a single church but to a group of churches. Philumen is of course a pure letter, and Philippians mainly so, the Pastoral, as their name implies, contain advice and instructions to the apostle’s lieutenants, Timothy and Titus, in the temporary charge committed to them of churches that the apostle could not visit himself. The Epistle to the Hebrews is an epistolary treatise of uncertain date, on the Pauline model, and by a disciple of St Paul or at least a writer strongly influenced by him, though influenced also in no small degree by the Jewish school of Alexandria represented by Philo. Of the many theories as to the address, the most plausible are perhaps those which would apply to a single congregation of Hebrew Christians in Rome, or to a local church or group of local churches in Palestine, perhaps like that of which the centre would be at Caesarea. It is not probable that the epistle was addressed to the mother church at Jerusalem.

The above sketch of the growth and general character of the Pauline Epistles is based upon the hypothesis that all thirteen are genuine. But some discrimination should be made in detail. The scepticism which challenges the whole collection may be set aside as alarmingly pernicious and unreasonable. Apart from this, keen criticism of modern times has fastened especially upon two groups:—the Thessalonians; Colossians with Philemon, Ephesians and the Pastoral. The present writer would accept without any real reservation the first of these classes; and the second be would, also himself accept, though in regard to this class he would think it right to speak with rather more reserve. This may be said to be the position generally taken up by the leading English scholars; it is, on the other hand, largely in the direction of abundant doubt, and is the position of Harnack, a little more from that of Jülicher, and a little more from that of von Soden.

1 Thessalonians is still questioned by scholars of some note; but whereas they say that it can be accepted only on the ground of the existence of 1 Thessalonians (assumed to be genuine), this is practically giving up the whole case, because the objections drawn from 1 Thessalonians are, at least to the present writer, only an example of faulty criticism. Still less is there any valid argument against Philemon. It is a mark of the improved methods now current in Germany that, whereas in 1886 this epistle was rejected by a scholar as able and sober as Weizsäcker, Jülicher now pronounces it to be "one of the most assured possessions of the apostle" (Einf. 5th ed., p. 112).

But there is an arguable case of some real weight against Colossians, Ephesians, Pastoral—least against Colossians and perhaps more against the Pastoral than any others. The argument is based on its connexion with Philemon. And the objections to Ephesians are considerably reduced when it is taken as a circular letter. But it should be admitted that, especially in regard to Ephesians and Pastoral, there is a perceptible difference, (a) in style, and (b) in characteristic subject matter, from the standard epistles of these
later epistles are really the work of St Paul, the difference must be accounted for (a) by a somewhat unusual range of variation in style and thought on his part, and (b) by different environment and different purposes. The question is whether these explanations are adequate. The writer of this is inclined to think that they are. St Paul was in any case an unusual writer, by no means facile or with ready command of expression; still, he could by an effort express what he wanted, and new situations called up new words and new ideas. He was also a writer in whom the physical wear and tear must have been enormous. It might well be believed that the change in the so-called Epistles of the imprisonment from the earlier epistles was due in part to the physical effects of prolonged confinement, as compared with the free and open life. If the reasons suggested above are not adequate, then we must set down the questioned epistles to some disciple of St Paul, who has carried the ideas and principles of his master a step farther or has applied them to a different set of problems and conditions.

2. The Gospels and Acts.—The Gospels and Acts arose in a way very similar to the Pauline Epistles. Here too there was no deliberate intention of writing a series of books that should be accepted as sacred and authoritative. Here too the expectation of the near return of Christ doubtless delayed for a number of years the desire and need for written compositions. Here too the first steps were taken to meet the exigencies of the moment dictated. We are again driven to fill up gaps in our knowledge of conjectures; but some such outline as the following has much to commend it.

When the enterprise of Christian missionaries had gone on for some little time, especially in the regions outside Palestine where there was little or no previous knowledge of Christ and of Christian ideals, the wandering prophets and apostles by whom the missions were mainly conducted must have soon begun to feel the need for some sort of written manual to supplement their own personal teaching. It was one of the characteristics of the early Christian teachers that they rarely stayed for any length of time in a place; they moved on, and the little congregation was left to wait for another visitor, who might be some time in coming. How was this interval to be filled? There should be every degree of preparation, or want of preparation, for the reception of Christian teaching. Some Jews, like those who are described in the Gospel as “waiting for the kingdom of God” (Matt. 21:31), women carefully trained in the Old Testament, who would be almost like the kingdom even before they had heard of Christ. Other Gentile converts would require instruction in the very rudiments of ethical and monotheistic religion. Between these extremes there would be many shades and degrees of ignorance and knowledge. How could these various cases be met at once most simply and most effectually? We remember that the Christian preachers were preaching before all things a Person, but a Person whose interest for these new converts lay chiefly in the fact that He was about to come and establish a supernatural kingdom for which they had to fit themselves. The best way therefore of helping them to do this was to provide them with an outline of the characteristic teaching of Christ, which should be at the same time a clear statement of His moral demands. It is probable that these requirements suggested the form of the first Christian Gospel, which the writer believes to be rightly identified with the so-called Logia of St Matthew, now often designated by the symbol Q. It did not aim at being a history, and still less a complete history, but it was mainly a collection of sayings and sayings-like statements, the purpose of which was to furnish a historical support for the claim that Christ was the promised Messiah. It was a work of translation, a collection of sayings transmitted orally from the lips of the cross to the ears of the hearers.

It would be somewhat later than this, and not until the eschatological outlook became weaker, and men began to turn their regard to the past rather than to the future, that there would gradually arise a more strictly historical interest. There is reason to think that in the Christian Church this interest did not begin to be active much before the decade A.D. 60–70. Its first conspicuous product was our present Gospel of St Mark, which was probably composed at Rome within the years 64–70. We say advisedly “our present Gospel of St Mark,” because there does not seem to us to be any sufficient reason for presupposing an Ur-Marcus, or older form of this Gospel.

These two works, the Logia (or, as some prefer to call it, the Non-Markan document) common to Matthew and Luke) and the Mark-Gospel, were the prime factors in all the subsequent composition of Gospels. Our Matthew and our Luke are just combinations, differently constructed, of these two documents, with a certain amount of additional matter which the editors had collected for themselves. And it is probable that other Gospels of which only fragments have come down to us, like the Gospel according to the Hebrews and the Gospel of Peter, have been built up out of the same materials.

St Luke was the first to write, as we may see from his preface, definitely in the spirit of a historian. He addresses his work to Theophilus, apparently an official person, who had already been taught the main outlines of Christianity. He had planned his work on a large scale; and in Acts we have its second volume. It is an event of no small importance for criticism that so eminent a scholar as Prof. Harnack should have come round to the view, almost universally prevalent in England, that St Luke himself was the final editor and author of both the Third Gospel and the Acts. It is a very secondary question when their message was written.

The reasons which converge upon the conclusion just expressed as to the origin and nature of the fundamental documents worked up in our present Synoptic Gospels are as follows:—

(i.) The literary analysis of the Synoptic Gospels brings out a number of sections common to Matthew and Luke which probably at one time existed as an independent document. (ii.) This document consisted, in the main though not entirely, of a collection of Sayings of the Lord, which set in strong relief at once His character and the moral and religious ideal that He desired to commend. (iii.) We have an express statement, which must have been originally made before the end of the first century, that the apostle Matthew composed in Hebrew a work described as Logia. This word need not mean, but may quite well and pointedly mean, a collection specially of Sayings, and would still more aptly denote a collection of divine or authoritative sayings (λόγια=prop. “oracles”). (iv.) We know further that the conditions of early Christian missionary teaching were such as have been described. We learn this especially from the Didache; and the first part of that work, the so-called section on religious conduct, thought to have been in the first instance a Jewish manual put into the hands of proselytes. On our hypothesis the Logia would have been a sort of Christian manual used with a similar object. (v.) We are confirmed in this opinion by the fact that the epistles of St Paul furnish many indications that Christians in general, including those who had not been much in contact with the original Twelve, were well acquainted with the leading features in the character of Christ and in the Christian ideal, although there is little corresponding evidence for their knowledge of details in the life of Christ.

There is a similar statement to the one mentioned above, that like it may have been originally made before the end of the first century, as to a Gospel composed by St Mark on the basis mainly of the preaching of St Peter, though this need not exclude personal experience (as, e.g., perhaps in Mark xiv. 51–52) or information derived from other sources. Only raw materials came from St Peter, and those probably not checked or revised by him; the arrangement is due to Mark himself, and is more successful than might have been expected in the circumstances—perhaps partly due to the influence of the earlier harmonic work.

According to Irenaeus (c. A.D. 185), who is more precise than Clement of Alexandria, the Gospel was not published until after the death of Peter, which would place its composition between the limits A.D. 65 and 70. The phenomena which are sometimes supposed to require the hypothesis of an Ur-Marcus are more simply and satisfactorily explained as incidents in the transmission of the Marcan text.

The matter peculiar to Matthew and Luke raises a number of interesting questions which are still too much sub judice to
be answered decidedly or dogmatically, though approximate and professional answers may or not be forthcoming. All periods of the problem have been greatly favored by the recent publication of important works by Wellhausen and Harnack (see below). The date of the completed Luke depends (a) on whether or not we believe Luke himself or a later disciple to be the author, and (b) whether or not we believe that the author of Acts had seen Josephus' *Antiquities*, published in A.D. 93 or 04. Professor Burkitt takes an original line in maintaining that Luke was the author of both works, and yet that he had seen *Antiq*. The present writer is inclined to think the latter hypothesis not proven. The date of Matthew cannot be fixed more nearly than 70-100.

3. The Catholic Epistles.—The Catholic Epistles were so called in the first instance from their wider and more indefinite address; they were intended for Christians generally, or over some wide area, rather than for a particular church or individual. 2 and 3 John are exceptions, but probably came in under a wing of the larger epistle, which is strictly "catholic." As applied to a class of epistles, the title dates from Eusebius, early in the 4th century; the epistle is given to single epistles by Origen, and is found as far back as the end of the 2nd century. In later Latin usage "catholic" came to mean much the same as "canonical," another name that was also given.

This group of epistles practically continues and supplements the work of the epistles of St. Paul. 1 Peter, if genuine, must date from the end of the apostle's career (for the early composition claimed for it by B. Weiss is a paradox that may be disregarded). It was written to instruct and encourage the Christians of Asia Minor at a time of persecution, which on the hypothesis of genuineness, would be the Neronian, i.e. a secondary outbreak perhaps loosely connected with the onslaught in Rome. The Epistle of James (also, if genuine) must be placed late in the lifetime of the brother of the Lord. In that case it was probably written with any direct polemic against writings of St. Paul, but against heresy versions of his teaching that had reached Jerusalem. Controversy of this kind is not always conducted with complete understanding of that which is being opposed. The Epistle of Jude cannot be either dated or localized with any certainty. It seems on the whole most probable that 2 Peter is not a genuine work, but that it came from the same factory of pseudonymous Petrine writings as the Apocalypse which bears the same name, though the one has, and the other has not, obtained a place within the Canon. This epistle was questioned from the first, and only gained its place with much hesitation, and rather through slackness of opposition than any conclusiveness of proof. The three Johannine epistles may be more conveniently treated under the next head.

Even in the case of the two more important epistles, 1 Peter and James, we have to add the qualification "if genuine," but rather perhaps because of the persistence with which they are challenged than because of inherent defect of attestation. The evidence for 1 Peter is both early in date and wide in range, and the book was one of those that passed as "acknowledged" in antiquity. The evidence for James is not so widely diffused but is found in early writings. Perhaps the position of these two epistles might be described as not unlike that of Colossians and Ephesians. Instead of casting doubt upon them, we should prefer to say that they are both probably genuine, but that there are features about them that are not as yet fully explained. The chief of these features is their relation to the writings of St. Paul. There is indeed so much that is Pauline in 1 Peter as to give distinct attractiveness to the hypothesis, which is most elaborately maintained by Zahn, that a larger share than usual in the composition of the letter was left to Silvanus (1 Peter v. 12). Nor does it appear to us that the objections to this theory brought by Dr Chase in his excellent article on the epistle in Hastings' *Dictionary* are really so fatal as he supposes. The epistle is more the work of a companion of St Paul of long standing than of one who, with quite different and independent antecedents, had only been influenced by the perusal of one or two of St Paul's letters. In the Epistle of James we have a really distinct type; and it seems to us that the degree to which the epistle misses its mark as a polemic may be easily and naturally accounted for in many ways than one.

4. The Johannine Writings.—The Gospel and Epistles that bear the name of John, and the Apocalypse, form a group of writings that stand very much by themselves and are still the subject of active discussion. The points in regard to them that would unite the greatest number of suffragues would seem to be these:—(i) That, except 2 Peter, they are probably the latest of the New Testament writings, and that they form a group closely connected among themselves, though it is not clear how many hands have been at work in them. (ii) That they arose not far from each other towards the end of the 1st century. The Apocalypse is plausibly dated by Reinach and Harnack near to the precise year 93, and the other writings may be referred to the reign of Domitian (81-96), though many critics would extend the limit to some two decades later. (iii) The writings are to be connected, either more or less closely, with John of Ephesus, who with all due respect to John the Baptist, was the prominent figure towards the end of the 1st century. On the other hand, the greatest differences were:—(i) As to the personal identity of this John—is he himself "the beloved disciple"? Is he the apostle, the son of Zebedee or another? Can the writer of the Apocalypse be the same as the writer of the Gospel and Epistles? (ii) What is the exact relation of John of Ephesus to the Gospel? Is he its author or only the authority behind it? (iii) How far is the Gospel intended to be, and how far is it, in the strict sense historical? This last question is beginning to overshadow all the rest.

Whatever may be the ultimate decision on these intricate questions, the Fourth Gospel in any case played a very important part in the history of the Church and of Christian theology. It drew together and gathered up into itself the forces at work in the apostolic age; and, by reaching out a hand as it were (through the preface) towards Greek philosophy, it succeeded in so formulating the leading doctrines of Christianity as to make it, while tolerable than it had as yet been to the Gentile world, and in securing for the Gospel a place in the main stream of European thought. It is probably true to say that no other primitive Christian writing has had so marked an effect on all later attempts to systematize the Christian creed.

The situation as to the Fourth Gospel has been altered in recent years by the statement attributed to Papias that the two sons of Zebedee (and not only one) were slain by the Jews—a statement which becomes more difficult to put aside as the evidence for its veracity is filled in (cf. G. W. E. iff.; H. problems to the New Testament, 2nd ed., by E. Schanz, Uber d. Tod d. Sohne Zebedee, Berlin, 1902). But this statement does not affect the historical character of John of Ephesus, who is also expressly described by Papias as "a disciple of the Lord" (Eus. H.E. iii. 35, 4). On the other hand, the theory that the Gospel is a thorough-going allegory must be hard to maintain in view of the frequent appeals to "witness" which is several times defined as eye-witness (John i. 15, 32, ii. 11, xix. 35, xxii. 24; 1 John i. 1-3; cf. John v. 36, x. 25). This is borne out by Ignatius with his statement that the "ascription of the Gospel to John does not billion on its own hand..." (Tatial 15, 1; cf. Trall. xii. 1, Smyrn. i. 2, 2, iii. 1-3, v. 2). If the writer of the Gospel were simply inventing his facts, they would be no proof of his thesis (John xx. 32). It is a paradox that he should be invoked to prove the reality of Jesus Christ (first Doceetism), and yet that it should be contended at the same time that for him, ideas, and not events, were the true realities.

5. Other Literature not included in the New Testament.—It must not be thought that the primitive Christian literature came abruptly to an end with the writings that are included in our present New Testament. On the contrary, all round these there was a broad fringe of writings more or less approximating to them in character. Most nearly on the lines of the New Testament are the so-called Apostolic (really Sub-Apostolic) Fathers (Clement of Rome to the Corinthians, Didache, Barnabas, the letters of Ignatius and the single letter of Polycarp, the Shepherd of Hermas, the homily commonly known as the Second Epistle of Clement). These are in most cases the writings of leading persons in the Church who took up and continued the tradition of the apostles. Barnabas and 2 Clement are more
eccentric, but the writers must have been persons of some note. Outside this group would come what are called the Apocryphal Gospels and Acts (Gospel according to Hebrews, according to Egyptians, of Peter, of Truth, of the Twelve [or Ebonite Gospel], the recently recovered so-called Logia; the Gospel of Nicodemus, the Protevangelium of James, the Gospel of Thomas, the Acts of Pilate, Acts of Paul, Peter, John, Andrew, Thomas; the Preaching of Peter, the Apocalypse of Peter). As the 2nd century wears on, we come to controversial or philosophical works by Agrippa, Castor, Quadratus, Aristides. With the middle of the century we reach a considerable writer in Justin Martyr. With him the twilight period which succeeds to the apostolic age is over, and we enter upon the main course of ecclesiastical history. At this point, therefore, our survey may end.

(8) The Process of Discrimination and Collection. 1. Discrimination.—Throughout the apostolic age Christians were conscious of being carried forward in a great movement, the origin and motive-power of which they regarded as supernatural. It began on the Day of Pentecost, but continued in full tide almost to the end of the 1st century, and, even when it began to subside, it did so quite gradually. The moment of transition is clearly marked in the Didache, where the charismatic ministry of "apostles and prophets" is beginning to give place to permanent local officials of the Church, bishops, presbyters and deacons. The literature that we now call the New Testament held its place because it was regarded as a product of the palmy days of that great movement. It was considered to be the work of inspired men, of men whom the Holy Spirit, at that time specially active in the Church, had chosen as its organs. We have seen how St Paul, for instance, fully believed that his own preaching had a force behind it which vindicated for it the claim to be "the word of God" (1 Thess. ii. 13); and it was inevitable that the other preachers and teachers should have had in different degrees something of the same consciousness. This consciousness reminds us of its strongest expression in the Apocalypse.

There is really no contradiction between this sense of a high calling and mission, with a special endowment corresponding to it, and the other fact that the writings from this age that have come down to us are all (except perhaps the Apocalypse, and even the Apocalypse, in some degree, as we see by the letters to the Seven Churches) strictly occasional and natural in their origin. The lives and actions of apostles and prophets were in their general tenor like those of other men; it was only that, for the particular purpose of their mission, they found themselves carried beyond and above themselves. St Paul himself knew when he was speaking by the Spirit, and when he was not; and we too can recognize to some extent when the apostolic comes upon him. It is fortunate that this should be so clearly marked in his epistles, because it enables us to argue by analogy to the other writers. When we come to historical books like the third Gospel and the Acts, we find the writer just pursuing the ordinary methods of history, and not claiming to do anything more (Luke i. 1-4). With the methods of history, these writers were naturally exposed to the risks and chances of error attendant upon those methods. There was not at first among the writers any idea that they were composing an infallible narrative. The freedom with which they used each other's work, and with which the early texts were transmitted, excludes this. But there was the idea that the whole movement of the Church to which they gave expression was in a special sense divine. And this belief was the fundamental principle that determined the marking off of the writings of the first, or apostolic, age from the rest.

At the same time it must not be supposed that a hard and fast line can be drawn between what the spiritual stimulus of this first age ceased. The writings of Clement of Rome (A.D. 97) and of Ignatius (c. A.D. 110) mark the transition. Ignatius, for instance, clearly distinguishes between his own position and that of the apostles: "I do not enjoin you, as Peter and Paul did. They were Apostles, I am a convict; they were free, but I am a slave to this very hour." (Rom. iv. 3). And yet, none the less, Ignatius is conscious of acting and speaking at times from a kind of inspiration. "Even though certain persons desired to deceive me after the flesh, yet the spirit is not deceived, being from God; for it knoweth whence it cometh and where it goeth, and it searcheth out the hidden things. I cried out, when I was among you; I spake with a loud voice, with God's own voice, give ye heed to the bishops, and the presbyters and deacons." (Philadeph. vii. 1). In like manner Clement, in two places (lix. 1, xiii. 2), writes as though God were speaking through him.

2. Collection.—Concurrently with the tendency to discriminate between the higher authority of certain writings and the lower authority of others, there was also a tendency to collect and group together writings of the first class. The earliest example of this tendency is in the case of the Pauline Epistles. Marcion, we know (c. A.D. 140), had a collection of ten out of thirteen, in the order, Gal. i and 2 Cor., Rom. 1 and 2 Thess., Laodic. (= Eph.), Col., Phil., Philem. We observe that the Pastoral Epistles are omitted. But it is highly probable that the collection went back to the number before Marcion. The evidence of Polycarp contains references or allusions to no less than nine out of the thirteen epistles, including 2 Thess., Eph. 1 and 2 Tim. Ignatius, writing just before, gives clear indications of six, including 1 Tim. and Titus. The inference lies near at hand that both writers had access to the full collection of thirteen, not omitting the Pastoral. Polycarp (ad Phil., iii. 2) shows how strong was the interest in collecting the writings of eminent men.

It of course did not follow that, because the letters of St Paul were collected, they were therefore regarded as sacred. The feeling towards them at first would be simply an instinct of respect and deference; but we have seen above that the essential conditions of the higher estimate were present all along, and were only waiting to be recognized as such as reflective thought was turned upon them. This process appears to have been going on throughout the middle years of the 2nd century.

The famous passage of Irenaeus (Adv. Haer. iii. 15. 8) assumes the possession by the Church of four authoritative Gospels and no more. This is the general view of the Church of his time, except the little clique known as the Alogi who rejected the Fourth Gospel, and Marcion who only recognized St Luke. But here again, we may go back some way farther. Irenaeus writes (c. A.D. 185) as though the Four Gospels had held the field as far back as he can remember. About A.D. 170 Tatian, the disciple of Justin, composed out of these Gospels his Diatessaron. If Justin used any other Gospel, his use of it was very subordinate. Practically we may say that the estimate of the Four to which Tatian and Irenaeus testify must have been well established by the middle of the century, though sporadic instances may be found of the use of other Gospels that did not become canonical. The sifting out of these was proceeding steadily and gradually, and by the end of the century it may be regarded as complete.

We must make allowance for the existence of this margin, and for the blurring of the boundary-line that goes along with it. We cannot claim for the Church absolute sureness of judgment as to what falls on one side of the line and what on the other. It is possible, e.g., that a mistake has been made in the case of 2 Peter, which, however, is edifying enough. It is not less possible that writings like 1 Clem. and Epp. Ignat. are not inferior in real religious value to the Epistle of Jude. But, broadly speaking, the judgment of the early Church has been endorsed by that of after ages.

Harnack raises an interesting question (Reden u. Aufsätze, ii. 239 ff.), how it came about that four Gospels were recognized, and not only one. There are many indications early in the 2nd century towards the recognition of a single Gospel; for instance, there are the local Gospels according to Hebrews, according to Egyptians; Marcion had but one Gospel, St Luke. The Valentinians preferred St John and so on; Tatian reduced the Four Gospels to two, as a result of a Harmony, and it is possible that something of the kind may have existed before he did this. There is probably some truth in the view that the Church clung to its Four Gospels as a weapon against Gnosticism; it could not afford to lose them. But over and above this, there was probably something in the circumstances in which the
canonical Gospels were composed, and in their early history, which gave them a special prestige in the eyes of the faithful. The story
which Eusebius quotes from Clement of Alexandria (H.E. vi. 14)
seems to point to something of the kind.

3. Influences at work.—The whole process of the formation of
the New Testament was steady and gradual. The critical
period, during which the conception grew of the New Covenant
with its definite contents, was the period of the Old Covenant
in its written embodiment we call the Old Testament, extends
roughly over the 2nd century. By the last decades of that
century a preliminary list of these new Sacred Books had been
formed and placed by the side of the Old with substantially the
same attributes. We must briefly sketch the process by which
this came about, tracing the causes which led to the result and
indicating the manner in which they operated.

We have seen that the ultimate cause was the consciousness
on the part of the Church that the first age of its own history
was characterized by spiritual workings more intense than other
times. This feeling had been instinctive, and it found expression
in several ways, each one of them partial, when taken alone,
but obtaining their full effect in combination. It should be
understood that the goal towards which events were moving
all the time was the equalizing of the New Testament with the
Old Testament.

(a) Public Reading.—From the first the way in which the Epistles
of Paul were brought to the knowledge of the churches to which
they were addressed was by reading in the public assemblies for
worship. This was done by the direction of the apostle himself
(Teatr. iv. 15). At first any writing that was found to be
useful for edification was read in this way, especially if it had
11). But, as worship became more thoroughly organized, it was
invented with increasing solemnity; the freedom of choice
gradually restricted; and inasmuch as sections were regularly taken
from the Old Testament, it was only natural that other lections
read alongside of them should gradually be placed upon the same
footing.

(b) Authority of Christ and the Apostles.—As the words of prophets
and lawgivers had from the first carried their own authority with
them under the Old Covenant, so from the first the words of Christ
received much stronger emphasis from the New. And what
applied to words of Christ soon came also to apply in their degree
to words of the apostles. The only difference was that an authority
at first instinctively assumed came to be consciously recognized
and formally defined. There was also a natural tendency towards
levelling up the different parts of books and groups of books.
In other words, the somewhat vague sense of spiritual power and
impressiveness hardened into the conception of sacred books united
in a historical whole.

(c) Controversy.—The process was accelerated by the demand for
a standard or rule of faith and practice. At an early date in the
2nd century this demand was met by the composition of the
oldest form of the New Testament, or what is called the Creed. But the
condensed essence of the New Testament scriptures, and behind
it there lay an appeal to these scriptures, which was especially
necessary where (as in the case of the Valentinian Gnostics) the
dissident bodies professed to accept the common belief of Christians.
Its conflict with Gnostics, Marcionites and Montanists the Church
was led to insist more and more upon its Bible, its own Bible, just
as in its earlier controversy with the Jews it had to insist on the Bible
which it believed they had. This was a yet further cause of the
equalizing of the two parts of the sacred volume, which went on with
an imperceptible crescendo through the first three quarters of the
2nd century, and by the last quarter was fairly complete.

(y) Provisional Canon of New Testament (end of 2nd century).
—By the last quarter of the 2nd century the conception of a
Christian Bible in two parts, Old Testament and New Testament,
may be said to be definitely established. Already at the beginning
of this period Malchus had drawn up a list of the twenty-two
books of the Old Covenant, and the New Testament is which
the Old Covenant made its appeal. It was a very short step
from compiling of a similar list for the New Covenant, which by another
very short step becomes the New Testament, by the side of the
Old Testament. It is therefore not surprising, though a piece of
great good fortune, that there should be still extant a list of the
New Testament books that may be roughly dated from the end of
the century. This list published by Muratori in 1740, and
called after him "the Muratorian Fragment on the Canon," is
collaborative work to be of Roman origin and to be a translation from the Greek, though there are a few dissentients on
both heads. The list recognized four Gospels, Acts, thirteen
epistles of Paul, two epistles of John, Jude, Apocalypse of John
and (as the text stands) of Peter; there is no mention of
Hebrews or (apparently) of 3 John or Ephesians of Peter, where it is
possible—we cannot say more—that the silence as to 1 Peter
is accidental; the Shepherd of Hermas on account of its date
is admitted to private, but not public, reading; various writings
associated with Marcion, Valentinus, Basiliades and Montanus
are condemned.

There are many interesting points about this list, which still shows
considerable freshness of judgment. (i) There are traces of earlier
controversies about the Gospels, both in disparagement of the Synoptics
as compared with St John, and in criticism of the Creed differing from
the former. (ii) There is a healthy tendency to lay stress on
the historical value of narratives which proceed from eye-witnesses.
(iii) An opposing rule of unity is ascribed to the Holy Spirit.
(iv) The writer is concerned to point out that lections added
to a single church and even to an individual may yet have
a wider use for the Church as a whole. (v) The sense is not yet lost
that the appeal of the New Testament is as coming from men of
prophetic gifts, and that of the New Testament as coming from apostles.
(vi) It is in accordance with this that a time limit is placed upon
the books included in the New Testament. (vii) Christians are to
be on their guard against writings put forth in the interest of heretical
sects.

When the data of Fragm. Murat. are compared with those supplied
by the writers of the last quarter of the 2nd and first of the
3rd centuries (Tatian, Theoph. Ant., Iren., Clem. Alex.,
Tert., Hippol.), it is seen that there is a fixed nucleus of writings
that is acknowledged, with one exception, over all parts of
the Christian world. The exception is the Syriac-speaking Church
of Edessa and Mesopotamia. This Church at first acknowledged
only the Gospel (in the form of Tatian's Diatessaron), Acts and
the Epistles of Paul. These seem to have been the only books
translated immediately upon the foundation of the Edessan Church,
even though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church, though an edition of the separate Gospels must have
enjoyed earlier in the New Testament Church.
received its impulse from Athanasian, the power by which it was carried through and established was largely that of his powerful ally, the Church of Rome.

The final victory was no doubt a little delayed. Asia Minor and Syria were for most of the 4th century divided between the following of Eusebius (Cyril of Jerusalem in A.D. 348, Gregory of Nazianzus, the list of A Post. Can. 35, that attached to Can. 50 of the Council of Laodicea, c. A.D. 363) and the school of Antioch. The leading members of that school adopted 3 Epp. Cath. (James, 1 Peter, 1 John), Theod. Mops. omitting this group altogether, and the whole school omitting Apoc. Amphilochoi of Iconium (c. 380) gives the two lists, Eusebian and Antiochene, as alternatives. The Eusebian list only wanted the complete admission of the Apocalypse to be identical with the Athanasian; and Athanasius had one stalwart supporter in Epiphanius (ob. 403).

The original Syriac list, as we have seen, had neither Epp. Cath. nor Apoc. The Peshito version, in regard to which Professor Burkitt’s view is now pretty generally accepted, that it was the work of Rabban Jacob, Bishop of Edessa, 441-443, added the 3 Epp. Cath. The remaining 4 Epp. Cath. and Apoc. were supplied in the Philoxenian version of 589, and retained in the Harkelean revision of 616. But both these were Monophysite and of limited use, and the Nestorians still went on using the Peshito.

Meantime, in the West, an important Synod was held by Damausus at Rome in 382 which, under the dominant influence of Jerome and the Athanasian tradition, drew up a list corresponding to the present Canon. This was ratified by Pope Gelasius (492-496), and independently confirmed for the province of Africa by a series of Synods held at Hippo Regius in 508, and at Carthage in 307 and 419, under the lead of Augustine. The formal completion of the whole process in East and West was reserved for the Quinisext Council (Council in Trullo) of 692. But even after that date irregularities occur from time to time, especially in the East.

In the fixing of the Canon, as in the fixing of doctrine, the decisive influence proceeded from the bishops and the theologians of the period. 325-450. But behind these was the practice of the greater churches; and behind that again was not only the lead of a few distinguished individuals, but the instinctive judgment of the main body of the faithful. It was really this instinct that told in the end more than any process of quasi-scientific criticism. And it was well that it should be so, because the methods of criticism are apt to be, and certainly would have been when the Canon was formed, both faulty and inadequate, whereas instinct brings into play the religious sense as a whole; with spirit speaking to spirit rests the last word. Even this is not infallible; and it cannot be claimed that the Canon of the Christian Sacred Books is infallible. But experience has shown that the mistakes, so far as there have been mistakes, are unimportant; and in practice even these are rectified by the natural gravitation of the mind of man to which it finds most nourishing and most elevating.

Bibliography.—The separate articles on the various books of the New Testament may be consulted for detailed bibliographies. That portion of the above sketch has been inserted in order to give an outline the ground usually covered analytically and on a far larger scale by Introductions to the New Testament, and by Histories of the New Testament Canon. In English there is a standard work of full and the most recent is Johann von Eichstätt, E. Kühler, Gesch. d. neut. Kanons (2 vols., 1888-1892, third to follow), For the sake of completeness, and in (state of facts) trustworthy matter. Jülicher’s work is also highly practical, very complete and well proportioned in scale, and up to a certain point its matter is also excellent. The Hpologes, ed. Caractaris, has been lately published by Dr. Ed. G. in 1907, it may also be welcomed; it is clear and methodical, and does not make the common mistake of assigning too much to secondary causes; the author does not forget that he is dealing with a sacred book, and that he has to show why it was held sacred.

2. Texts and Versions.

The apparatus criticus of the New Testament consists, from one point of view, entirely of MSS.; but these MSS. may be divided into three groups: (A) Greek MSS., which in practice are known as “The MSS.” (B) MSS. of versions in other languages representing translations from the Greek; (C) MSS. of other writings whether in Greek or other languages which contain quotations from the New Testament.

(A) Greek MSS.—These may be divided into classes according to style of writing, material, or contents. The first method distinguishes between uncial or majuscule, and cursive or minuscule; the second between papyrus, vellum or parchment, and paper (for further details see Manuscript and Palaeography); and the third distinguishes mainly between Gospels, Acts and Epistles (with or without the Apocalypse), New Testaments (the word in this connexion being somewhat broadly interpreted), lectionaries and commentaries.

Quite accurate statistics on this subject are scarcely attainable. Von Soden’s analysis of numbers, contents and date may be tabulated as follows, but it must be remembered that it reckons many small manuscripts as separate MSS., e.g., 40 in the 4th century. It is also necessary to add that there is one small scrap of papyrus of the 3rd century containing a few verses of the 4th Gospel.

This tabular page begins by stating that MSS. of the New Testament are on paper, and that MSS. earlier than the 9th century are uncial and later than the 10th are minuscule. There are said to be 129 uncial MSS. of the New Testament (Kenyon, *Textual Criticism of the New Testament*, p. 45), but it is not easy to be quite accurate on the point.

Besides the MSS. mentioned in the table, there are 281 MSS. containing commentaries on the Gospels, 169 on Acts and Epistles, 66 on the Apocalypse, 1072 lectionaries of the Gospels and 287 of Acts and Epistles, making a grand total of 3608 MSS. It must be remembered that the dating of the MSS., especially of minuscules, is by no means certain: Greek Palaeography is a difficult subject, and not all the MSS. have been investigated by competent palaeographers.

The notation of this mass of MSS. is very complicated. There are at present two main systems: (1) Since the time of Wetstein it has been customary to employ capital letters, at first of the Latin and latterly also of the Greek and Hebrew alphabets, to designate the uncial, and Arabic figures to designate the minuscules. Of this system there are two chief representatives, Gregory and Scrivener. These agree in the main, but differ for the more recently discovered minuscules. Gregory's notation is more generally used, and Scrivener's, though still followed by many English scholars, is likely to become obsolete. This method of notation has various disadvantages. There are not enough letters to cover the uncial, the same letter has to serve for various fragments which are quite unconnected except by the accident of simultaneous discovery, and no information is given about the MS. referred to.

To remedy these drawbacks an entirely new system was introduced in 1902 by von Soden in his *Die Schriften des neuen Testaments*, Bd. 1, Abt. 1, pp. 33-40. He abandons the practice of making a distinction between uncial and minuscule as such and introduces the alphabetic notation. Von Soden's system of notation is less important than the date and contents of a MS. To indicate these he divided MSS. into three classes. (1) New Testaments (the Apocalypse being not regarded as a necessary part), (2) Gospels, and (3) Acts, Epistles and Apocalypse (the latter again being loosely regarded). These three classes distinguished by δι = διαθήκη, ε = εὐαγγέλια and α = αὐτοκλώσεις. To these letters he assigns numbers arranged on a principle showing the century to which the MS. belongs and defining its contents more precisely. The number is determined thus:—

| MSS. of the δ and α classes from the earliest period to the 9th century inclusive are numbered 1 to 49; those of the 10th century 50 to 99; for the latter centuries numbers of three figures are used, and the choice is made so that the figure in the hundreds' place indicates the century, 1 meaning 11th century, 2 meaning 12th century, and so on; to all these numbers the appropriate letter, if it be δ or α, must be always prefixed, but if it be ε, only when there is any chance of ambiguity. In δ MSS., a distinction is made for those of the 11th and subsequent centuries by reserving 1 to 49 in each hundred for MSS. containing the Apocalypse, 50 to 99 for those which omit it. Similarly, in α MSS., a distinction is made according to their contents; the three-figure numbers are reserved for MSS. which contain Acts, Catholic Epistles and Pauline Epistles with or without the Apocalypse, the presence or absence of which is indicated as in the δ MSS.; but when a MS. consists of only one part a "1" is prefixed, thus making a four-figure number, and the precise part is indicated by the two last of the four figures; 00-99 means Acts and Catholic Epistles, 20-69 means Pauline Epistles and 70-99 means Apocalypse. In the case of ε MSS. 1-100 is used for the earliest MSS. up to the 9th century, and as this is insufficient, the available numbers are increased by prefixing a α, and reckoning a second hundred from 101 to 199; 200 to 299 are MSS. of the 11th century, 300-399 of the 12th century, 400-499 of the 13th century, and so obtaining another hundred, e.g. 1000 to 1190, and in the 12th and subsequent centuries, even this is not enough, by passing on to the thousands and using 2000-2999 for the 12th century, 3000-3999 for the 13th and so on. In each case ε is prefixed whenever there is any chance of ambiguity. It is claimed that this system gives the maximum of information about a MS., and that it leaves room for the addition of any number of MSS. which are likely to be discovered. At present it has not seriously threatened the hold of Gregory's notation on the critical world, but it will probably have to be adopted, at least to a large extent, when von Soden's text is published.

The full details of this subject can be found in E. Miller's edition of Scrivener's *Introduction to the Textual Criticism of the New Testament* (George Bell, 1864); C. R. Gregory, *Prolegomena to Tischendorf's Kansas City Testamentum Sinaiticum* (Berlin, 1894); C. R. Gregory's *Textkritik* (Leipzig, 1900); H. von Soden's *Die Schriften des neuen Testaments* (Berlin, Band i., 1902-1907); F. G. Kenyon's *Handbook to the Textual Criticism of the New Testament* (New York, 1907), especially valuable for a clear account of the Papyri fragments.

It is neither possible nor desirable to give any description of most of these MSS., but the following are, critically and most important.

**Uncials.**—Codex Vaticanus (Vat. Gr. 1200), Greg. B. v. Soden 81; an uncial MS. of the 4th century. It is written in three columns and contains forty-two books, but the first and last are lacking. It contains the whole Bible, but in the New Testament is followed by Tischendorf's text. It is now at Christ Church, Oxford, and was first known to the public by a开花* article in *The Quarterly Review* (1797). It is now at the British Museum.

Codex Sinaiticus (St. Petersburg, Imperial library), Greg. B. v. Soden 82; an uncial MS. of the 4th century. It was found by C. Tischendorf (q.v.) in the monastery of St. Catherine on Mt. Sinai, and finally published in *Texte u. Untersuchungen*, xiii, 1896, and again in *Biblica*, vii, 1897. It is written on thin vellum in four columns of forty-eight lines each to a page. It contains originally the whole Bible, and the New Testament is still complete. At the end of the Old Testament it contains the original forms, unfortunately incomplete, and there was probably originally some other document between these two. The text was written, according to Tischendorf, by four scribes, of whom he identified one as also the scribe of Cod. Vaticanus. It was corrected many times, especially in the 6th century, by a scribe known as α and in the 7th by θ. It has, in the main, a Neutral text, less mixed in the Epistles than that of B, and not so pure in the Gospels. The corrections of θ are important, as they are based (according to a note by that scribe, at the end of Esther) on an early copy which had been corrected by the scribe of the Palimpsest, the disciple of Origen, friend of Eusebius and founder of a library at Caesarea.

The text of was written by Tischendorf's *Bibliae Codices Sinaitici Petropoliticani* (vol. iv., 1862), and separately in his *Novum Testamentum Sinaiticum* (1863); in 1906 it was published in colotype by the Clarendon Press, Oxford. The relations of to the other written MSS. are studied in *Textkritische Studien zum N.T.* (in Texte u. Untersuchungen, xi, 4). If Tischendorf was right in identifying the scribe of B with that of S, it is obvious that these MSS. probably come from the same place. The MS. was probably wrong, but there are some indications of relationships to justify the same view. The two most probable places seem to be Caesarea and Alexandria. The case for Caesarea is the colophon written by at the end of Esther, and also the proof of that at the end that the chapter division in Acts was followed in both and B and also be traced to the same library. This is a fairly strong case, but it falls short of demonstration because it cannot be shown that the MS. corrected and was used by another MS. of that name, and is so written because it is not certain either that the chapter divisions in Acts were added by the original scribes, or that and B were at that time in their original home, or that the chapter divisions were necessarily only to be found at Caesarea. The case for Alexandria depends partly on the orthography of B, which resembles...
Greco-Coptic papyri, partly on the order of the Pauline epistles. At present, both in \( \kappa \) and B, Hebrews is placed after 2 Thess., but in B there is also a continuous enumeration of sections throughout the epistles, according to which 1 to 88 cover Romans to Galatians, but Ephesians, the next epistle, begins with 70 instead of 59. The omitted section numbers are found in Hebrews. Obviously, the archetype placed Hebrews between Galatians and Ephesians, but the scribe altered the order and put it between 2 Thess. and 1 Thess. The change of order in this section is only found elsewhere in the Sahidic order of the New Testament, and it was probably therefore the original Alexandrian order. Moreover, we know from the Festal letter, Acts 20:37 (according to the Greek and Syriac texts, but not the Sahidic), that this order of the epistles is not found elsewhere in the Sahidic order of the New Testament, and it was probably therefore the original Alexandrian order. Hence, the combination of evidence strongly suggests that the order of the epistles is only found elsewhere in the Sahidic order of the New Testament, and it was probably therefore the original Alexandrian order.

[The section Textual Criticism below.]

The question of the provenance of \( \kappa \) and B may best be studied in connection with the Latin Old Testament. \( \kappa \) and B are derived from the Codex Vaticanus B (Cambridge, 1852), esp. pp. 31-43 (these more especially for the connection with Caesarea); A. Kahls, "Alter und Heimat der vato-Monumente," Wiss. zu Göttingen (1899), vol. i. pp. 72-79; and O. von Gebhardt in a review of the last-named in the Theologische Literaturzeitung (1899), col. 556.

Codex Bezae (Cambridge Univ. 2, 41), Greg. D, von Soden 5; an uncial Graeco-Latin MS, not later than the 7th century, and probably considerably earlier. The text is written in one column to a page, the Greek on the left hand page and the Latin on the right. It was given to the university of Cambridge in 1881, but its exact place of origin is not known. It had been preserved in the monastery of St. Ireneus there. There is no reason to question Beza's bona fide, or that the MS. was obtained by him after the sack of Lyons in 1809. The history of the MS. which is preserved in the belief that it had been for a long time in the same monastery. His information on this point would necessarily be derived from Protestant sources, which would not be of the highest value, and there is but little doubt that the MS. was in Italy. In the first place it is certainly identical with the MS. called \( \gamma \), which is quoted in the margin of the 1550 edition of Robert Stephanus' Greek Testament; this MS. and a fourth place it was used at the council of Trent in 1466. At a later time however, the MS. was in use in Italy at an early time. It is closely connected with cod. Sangermanensis (a direct copy) at St Petersburg, Greg. von Soden a 1027; cod. Anguissi (Cambridge, Trin. Coll. B xvii), Greg. von Soden a 235, and perhaps with cod. Darmst. B (K Bbl., Greg. Gw, von Soden a 1028. The text is published in Tischendorf's Codex Claromontanus (1852). Its relations to EFG are best discussed in Westcott and Hort's Introduction, §§ 50, 51, 52.

There are no other uncials equal in importance to the above. The next most valuable are probably cod. Regius of the 8th century at Paris, Greg. E, von Soden 1001, containing the Gospels; cod. Leningr. (the oldest MS) at St Petersburg, Greg. von Soden 1001, the only known MS. containing the Acts of the Apostles of the 7th century in Paris, Turin, Kiev, Moscow and St. Athos, Greg. Hw, von Soden a 1022, containing fragments of the Pauline epistles and the Apocalypse of the 7th century in Trinity College, Cambridge, Greg. Fw, von Soden a 1023. Cod. Claromontanus is closely related to cod. Claromontanus. Further details as to these MSS, with bibliographies can be found in Gregory's Prolegomena to the New Testament. ed. maj. vii., pp. 59, 60, 61.

Minuscules.—Very few of these are of real importance. The most valuable are the following:

1. The Ferrar Group; a group of eight MSS. known in Gregory's notation as 13, 69, 124, 346, 534, 788, 826, 828, or in von Soden's as 13, 69, 124, 346, 534, 788, 826, 828, which except 69, in spite of the dating implied by von Soden's notation were probably written in the 12th century in Calabria. They have a most peculiar text of a mainly "Western" type, with some special affinity to the Latin Old Testament. Commonly known as the Ferrar group, they are known as the Ferrar group in memory of the scholar who first published their text, and are sometimes quoted as Ps (which, however, properly is the symbol for Codex Bavaricus of the Gospels), and (G).

2. Cod. 1 and its Allies; a group of four MSS. known in Gregory's notation as 1, 118, 131, 209, and in von Soden's as \( \delta \), 346, 457 and 458. The dating implied by the latter notation is wrong, as 1, 118, and 457 are probably written before 900, while 131 and 209 is probably later than 200. It is sometimes quoted as Fam. and fam. It probably have a common archetype in Mark which is also represented by cod. 28 (e 168), 565 (e 93, quoted by Tischendorf and other MSS., and by Bezae), and cod. 602 and 604 (Scriver and others as 602). It seems to have had many points in common with the Old Syriac, but it is impossible to identify the locality to which it belonged. Other minuscules of importance are cod. 33 (\( \delta \) 48) at Paris, cod. 33, which is called in the Latin Old Testament, and is the best minuscule representative of the "Neutral" and "Western" type of text in the gospels; cod. 137 (c 364) at Milan, a valuable "Western" text of the Acts; cod. 78 (not in Gregory) in the Laura on Mt. Athos, a MS. of the Acts and epistles, with an early (mixed) type of text and rules of punctuation. The text of the Ferrar group was published after Ferrar's death in 1902.
by T. K. Abbott, A Collation of Four Important MSS. of the Gospels (Dublin, 1877). It is best discussed by Rendel Harris's book, The Origin of the Leicesters Codex (1887), The Origin of the Ferrar Group (1893), and The Ferrar Group (1900), all published at Cambridge. The first appears with a discussion of its textual relations, is given in K. Lake's "Codex I and its Allies" (Texts and Studies, vii, 3, 1902); 565 was edited by J. Belsham in Das Evangel. des Marcus nach d. gries. Cod. Theodorese, éc. (Christiania, 1883), many other codices of this branch were published, with the usual "Codex Purpureus," Texts and Studies, v. 41700 was published by H. C. Hoskier in his collation of cod. Ev. 604. London, 1890; a 78 is edited by E. von der Goltz in Texte und Untersuchungen, N.F. ii. 4.

(B) The Versions.—These are generally divided into (a) primary and (b) secondary; the former being those which represent translation made at an early period directly from Greek originals, and the latter being those which were made either from other versions or from late and unimportant Greek texts.

(a) The primary versions are three—Latin, Syriac and Egyptian.

Latin Versions.—1. The Old Latin. According to Jerome's letter to Pope Damasus in a.d. 384, there was in the 4th century a Latin version of the New Testament in use in Italy and called "exemplaria pene quod codices." This verdict is confirmed by examination of the MSS., which have pre-hermeneutic Latin. It is customary to quote by these small letters of the Latin alphabet, a representation of the Latin text, with the main details of the notation. We can distinguish two main types, African and European. The African version is best represented in the gospels by cod. Bohiensis (k) of the 5th (some say 6th) century at St Catherine's monastery on Mount Sinai, and by Codex Vaticanus (f, h, or reg.) of the 6th century, a palimpsest which once belonged to the monks of Fleury, and by the so-called Jacobus (m) or collection of quotations formerly attributed to Augustine but probably connected with Spain. This scanty evidence is dated and localized as African by the quotations of Cyprian, of Augustine (narr.), and of Priscianus, Bishop of Hadrumentum (d. c. 560), from the Apology of Vescellaretus. Augustine's Tertullian's quotations may be regarded as evidence for a Latin version or as independent translations from the Greek, or it is certain that this version is African in an exclusive sense; it was used by both the text of 12th century and the Latin Old Testament, and by the other on the other hand there is no proof that it was not. The European version is best represented in the gospels by cod. Vercellinum (a) of the 5th century and cod. Vercellinum (b) of a great variety the text and Latin Old Testament, and by (k) and of which are imperfect especially, which, however, is far the superior in quality; in the Acts and Catholic epistles by cod. Floriense (f., h. or reg.) of the 6th century, a palimpsest which once belonged to the monks of Fleury, and by the so-called Jacobus (m), collection of quotations formerly attributed to Augustine, but probably connected with Spain.

(b) The Secondary Versions.——The secondary versions are the Vulgate, the New Testament of Robert of Monte-Cassino, the Greek Text, the Epitome of the Church of the Visigoths, the Psalter of Athelstan, the Ambrosiaster, the 

2. The Vulgate or Hieronymian version. To remedy the confusion caused by the variations of the Latin text Pope Damasus asked Jerome to undertake a revision, and the latter published a new text of the New Testament in a.d. 384. The text of the Old Testament was revised for some time. This version was called the "Vulgate," the first printed edition, and it is said, Roger Bacon. In the Old Testament Jerome made a new translation directly from the Hebrew, as the Old Latin was based on the LXX., but in the New Testament he revised the existing version. He did not make a direct translation but revised the Vulgate of 384 a little more superficially in the epistles. He seems to have taken as the basis for this work the European version as it existed in his time, perhaps best represented by cod. Monacensis (q) of the 7th century, and the Latin text represented by cod. Amiatinus (f) of the 6th century would be added if it were not probable that it is merely a Vulgate MS., with intrusive elements. This type of text he revised with the help of the Greek MSS. of a type which does not seem to correspond to any now extant, but to resemble B more closely than any others.

The English edition of the Vulgate is printed by Robert, a 15th century, which was completed in 1484 at the command of Henry VII. It is printed for the English monarch and the English monarchs as a service, and is known as the "Pulpit Bible." The text was revised by J. Rickard and F. C. Burkitt, with an introduction by Mrs Lewis. It is a palimpsest MS., and the upper writing with the dating of the manuscripts in the order of 787, is the work of "John, the archbishop of Beth, Marq, and monastic of Ma'arr, then a city in the district of Antioch." The book was

**N.T. VERSIONS**

881
between Antioch and Aleppo; though the monastery is otherwise unknown, it seems probable that it was the source of many of the MSS. now at Sinai. The under writing seems to be a little earlier than that of the Curretian; it contains the gospels in the order Mt., Mc., Lk., Jo., and the Acts of the Apostles is a Lectionary. This version was used in the Church services: the Diatessaron was always the normal Syriac text of the gospels until the introduction of the Peshito. But the quotations and references in Aphraates, Ezechias, and Philoxenian, and other texts of the same period, show that it was known, even if not often used. It seems certain that the Old Syriac version also contained the Acts and Pauline epistles, as Aphraates and Ezechias agree in quoting a text which differs from the Peshito, but no MSS. containing this text are at present known. No text of this version is best given, with a literal English translation, in F.C. Burkitt's Evangelen de Mepharreshe (Cambridge, 1904.)

2. The Peshito (Simple) Version. This is represented by many MSS. dating from the 9th century. It has been proved almost by demonstration that F.C. Burkitt that the portion containing the gospels was made by Rabbula, bishop of Edessa (411), to take the place of the Diatessaron, and was based on the Greek text. Though this version of the gospels is much older and quite separate version. The exact limits of Rabbbula's work are difficult to define. It seems probable that the Old Syriac version did not contain the Catholic epistles, and it is certain that these were added by Rabbbula. But he never added 2 Peter, Jude, and 3 John, or the Apocalypse, and the text of these books, which is sometimes bound up with the Peshito, really is that of the Philoxenian or of the 10th century. The text of the synoptic gospels in Aphraates and Ezechias shows that Rabbbula revised the text of the Acts and Pauline epistles, but in the absence of MSS. of the Old Syriac for these books, it is difficult to define the extent, or character, of his revision. The text of the Old Syriac is a much older and more separate version.

3. The Philoxenian Version. This is known, from a note extant in MSS. of the Old Syriac version, to have been made in A.D. 508 for Philoxenus, bishop of Hierapolis, by Polycarpus, a choriscopus. No MSS. of it have survived except in 2 Peter, Jude, and 3 John and the Apocalypse. The four forms of the Peshito text found in the Peshito have been preserved in the Philoxenian text was used to supply these epistles which were not in the older version, and the Apocalypse was published in 1892 by Dr. Gwynn from a MS. belonging to Lord Crawford.

4. The Harklean Version. This is a revision of the Philoxenian text of Philoxenian text was used as a Greek version. It has important textual notes, and it has adopted a system of asterisks and brackets (the "Harklean apparatus") in an attempt to list the liturgical text to have been old MSS. from the library of the Enatcon near Alexandria. The marginal readings are therefore valuable evidence for the Old Alexandrian text. This version is quoted as Syr H (and sometimes as Syr Harklean). It has been called the "Harklean," and the name is attributed to a bishop of Antioch in the 6th century. The text of this version is that published in 1778-1803 by J. White at Oxford under the title Versio Philoxeniana; for the marginal notes see esp. Westcott and Hort, Introduction, and for Acts, Pott's Abendländische Text der Apostelgesch. (Leipzig, 1869).

5. The Syriac version of the New Testament, i.e., a collection of notes on the New Testament, is also known as the "Mascarian." This lectionary, which was once thought to have come from the neighbourhood of Jerusalem, has been shown by Burkitt to be the work of an unknowniar, and has been regarded as the text that was used in the Church of Jerusalem. It has been called the "Mascarian," and is usually quoted as Syr Pa and by Tischendorf as Syr*.

6. The Karkhanehian. This is not a version, but a "Syriac" of the New Testament, i.e., a collection of notes on the texts. Probably emanates from the monastery of the Skull. Little is known of it and it is unimportant.

[See Gillam's "Materials for the Criticism of the Peshito N.T." in Studia Biblica, iii. esp. pp. 60-63.]

7. The Diatessaron. This is something more than a version. It was originally a harmony of the four gospels made by Tatian, the first century, and is adopted in the Diatessaron. In its original form it is no longer extant, but it exists in Arabic (published by Ciasca) and Latin (cod. Fuldenensis), in both of which the text has undergone changes.

Tatian's "Diatessaron."—It was first printed in 105-138. It appears to have been the usual form in which the gospels were read until the beginning of the 5th century. When the Peshito was put in its place, and a systematic destruction of copies of the Diatessaron was undertaken, the text of the Diatessaron was probably destroyed in very many cases. It is possible that the text of the Diatessaron contained a first edition of the Coptic Version, but there is no evidence to support this. It is possible that the text of the Coptic Version is supported by the general probability of the spread of Christianity in Egypt.
which suggest that the native church and native literature had their strength at first chiefly in the southern parts of the country. It must be noted that Westcott and Hort called the Bohairic Memphitic, and the Sahidic Thebaic, and Tischendorf called the Bohairic Coptic.

(3) Among the secondary versions the only one of real importance is the Armenian Version.

The Armenian Version.—The early history of this version is obscure, but it seems probable that there were two translations made at the beginning of the 4th century. One of these was made by Hrofamos (Rufinus?) based on a Greek text; (2) the other by Sahak, based on Syriac. After the council of Ephesus (A. D. 430) Mesrop and Sahak compared and revised their work with the help of Cyril of Alexandria and Constantine. The general character of the version is late, but there are many places in which the Old Syriac basis can be recognized, and in the Acts and Epistles, where the Old Syriac is no longer extant, this is sometimes very valuable evidence.

Quotations in Patristic Writings.—The value of this source of evidence lies in the power which it gives us to date and localize texts. Its limitations are found in the inaccuracy of quotation of the writers, and often in the corrupt condition of their text.

This latter point especially affects quotations which later scribes frequently forced into accord with the text they preferred.

All writers earlier than the 5th century are valuable, but particularly important are the following groups: (1) Greek writers in the West, especially Justin Martyr, Tatian, Irenæus, and Tertullian, and Hippolytus; (2) Latin writers in Italy, especially Novatian, the author of the de Rebaptismate and Ambrosiaster; (3) Latin writers in Africa, especially Tertullian and Cyprian; (4) Greek writers in Alexandria, especially Clement of Alexandria, Origen, Athanasius and Eusebius, as well as the Egyptian fathers Origen and his followers in Lyce and Eusebius of Caesarea; (5) Syriac writers, especially Aphraates and Ephraem; it is doubtful whether the Diatessaron of Tatian ought to be reckoned in this group or in (1). None of these groups bears witness to the same text, nor can all of them be identified with the texts found in existing MSS, or versions, but it may be said with some truth that group 2 used the European Latin version, group 3 the African Latin, and group 6 the Diatessaron in the gospels and the Old Syriac elsewhere, while group 1 has much in common with the text of the tomos, and the text as it is found in the Diatessaron of Tatian. Group 4 is some-what more complex, with the so-called Alexandrian text found especially in L. Group 4 has a peculiar text which cannot be identified with any definite group of MSS. For further treatment of the importance of this evidence see the section below on the Diatessaron.

3. Textual Criticism.

The problem which faces the textual critic of the New Testament is to reconstruct the original text from the materials supplied by the MSS, versions, and quotations in early writers, which have been described in the preceding section on the apparatus criticus. His object, therefore, is to discover and remove the various corruptions which have crept into the text, by the usual methods of the textual critic—the collection of material, the grouping of MSS. and other authorities, the reconstruction of archetypes, and the consideration of transcriptional and intrinsic probability. No book, however, presents such a complicated problem or such a wealth of material for the textual critic. In a certain wide sense the textual criticism of the New Testament began as soon as men consciously made revisions and versions, and in this sense Origen, Jerome, Augustine and many other ecclesiastical writers might be regarded as textual critics. But in practice it is general, and certainly convenient, to regard their work rather as material for criticism, and to begin the history of textual criticism with the earliest printed editions which sought to establish a standard Greek Text. It is, of course, impossible here to give an account of all these, but the following may fairly be regarded as the epoch-making books from the beginning to the present time.

The Complutensian.—The first printed text of the Greek Testament is known as the Complutensian, because it was made under the direction of Cardinal Ximenes of Alcalá (Lat. Complutum). It was printed in 1514, and is thus the first printed text, but is not the first published, as it was not issued until 1522. It is not without value, but what MSS. Ximenes used, but it is plain from the character of the text that they were not of great value. His text was reprinted in 1589 by Chr. Plantin at Antwerp.

The criticism which was the result of this text was that of Erasmus. It was undertaken at the request of Joannes Froben (Frobenius), the printer of Basel, who had heard of Cardinal Ximenes' project and was anxious to forestall it. In this he was successful, as it was issued in 1516. It was based chiefly on MSS. at Basel, of which the only reliable one is cod. C. It was issued in new editions in 1519, 1522, 1527 and 1535, and the Aldine Greek Testament, printed at Venice in 1518, is a reproduction of the first edition.

Stephanus.—Perhaps the most important of all early editions were those of Robert Etienne, or Stephanus, of Paris and afterwards of Geneva. His two first editions (1546, 1549) were based on Erasmus, the Complutensian, and collations of fifteen Greek MSS. There were three volumes and a fourth edition (1550) was a foolscap revised text. It is this edition which is usually referred to as the text of Stephanus. A fourth edition (in 1600) published at Geneva in 1551 is remarkable for giving the division of the text into verses which has since been generally adopted.

Stephanus' work was continued by Theodore Beza, who published ten editions between 1564 and 1611. They did not greatly differ from the 1550 edition of Stephanus, but historically are important for the detail and accuracy with which the great part they played in spreading a knowledge of the Greek text, and with the account of the text which the Elzevirs made the standard on the continent.

Elsevir.—The two brothers, Bonaventura and Abraham Elsevir, published two editions at Leiden in 1624 and 1635, based chiefly on Codex Tischendorf. In the first (1624) he referred to it as "textum...nunc ab omnibus receptum," and this is the origin of the name "Textus Receptus" (or T.R.) often given to the ordinary Greek Text. The Elzevir text has formed the basis of all non-critical editions on the continent, and in England the 1550 text of Stephanus and the Elzevir text have been more generally adopted. The importance of both the Stephanus and Elsevir editions is that they formed a definite text for purposes of comparison, and so prepared the way for the next stage, in which scholars busied themselves with the investigation and collation of other MSS.

Wallen's Polyglot.—The first to begin this work was Brian Walten, bishop of Chester, who published in 1667 in the 5th and 6th volumes of his polyglot Bible the text of Stephanus (1550) with the readings of fifteen MSS. This text is now generally known as the Polyeot (1550) with collations of 78 MSS., besides those of Stephanus, the readings of the Old Latin, so far as was then known, the Vulgate and Peshito, together with full and valuable prolegomena.

Bentley.—A little later Richard Bentley conceived the idea that it should be possible to publish a critical edition of the New Testament by a comparison of the earliest Greek and Latin sources; he began to collect material for this purpose, and issued a scheme entitled "Proposals for Printing" in 1726, but though he amassed many notes nothing was ever printed.

W. Mace.—Fairness forbids us to omit the name of William (or Daniel?) Mace, a Presbyterian minister who published The New Testament in Greek and English, 2 vols. in 1729, and really anticipated many of the verdicts of later critics. He was, however, not in a position to obtain recognition, and his work has been generally overlooked.
BIBLE

88 4

/. J. Wetstein, one of Bentley's assistants, when living in Basel in
1730, published " Prolegomena " to the Text, and in 1751-1752 (at
Amsterdam) the text of Stephanus with enlarged Prolegomena and
apparatus criticus. His textual views were peculiar; he preferred
to follow late MSS. on the ground that all the earlier copies had
been contaminated by the Latin almost reversing the teaching
of Bentley. His edition is historically very important as it introduced the system of notation which, in the amplified form given to
it by Gregory, is still in general use.
J. A. Bengel, abbot of Alpirspach (a Lutheran community), published in 1734, at Tubingen, an edition of the New Testament which

—

marks the beginning of a new era. For the first time an attempt
was made to group the MSS., which were divided into African and
Asiatic. The former group contained the few old MSS., the latter
the many late MSS., and preference was given to the African. This
innovation has been followed by almost all critics since Bengel's
time, and it was developed by Griesbach.
/. /. Griesbach, a pupil at Halle of J. S. Semler (who in 1764
reprinted Wetstein's Prolegomena, and in comments of his own
took over and expounded Bengel's views), collated many MSS.,
and distinguished three main groups
the Alexandrian or Origenian
(which roughly corresponded to Bengel's African), found in ABCL,
the Egyptian version and Origen; the Western, found in D and
Latin authorities; and the Constantinopolitan (Bengel's Asiatic),
found in the later MSS. and in Byzantine writers. His view was
that the last group was the least valuable; but, except when internal evidence forbade (and he thought that it frequently did so),
he followed the text found in any two groups against the third. His
first edition was published in 1774-1775, his second and improved
edition in 1796 (vol. i.) and 1806. For the second edition he had
the advantage not merely of his own collection of material (published, chiefly in his Symbolae Criticae, 1785-1793), but also of many
collations by Birch, Matthaei and Adler, and an edition with new

/. L. Hug, Roman Catholic professor of theology at Freiburg,
published (Stuttgart and Tubingen) his Einleitung in die Schriften
des_N. T. (1808); he is chiefly remarkable for the curious way in
which he introduced many critical ideas which were not appreciated
at the time but have since been revived. He accepted Griesbach's
views as a whole, but starting from the known recensions of the
LXX. he identified Griesbach's Alexandrian text with the work of
Hesychius, and the Constantinopolitan with that of Lucian, while
he described Griesbach's Western text as the Koivq 2k6o<tis.
/. M. A. Scholz, a pupil of Hug, inspected and partially collated
nearly a thousand MSS. and assigned numbers to them which have
since been generally adopted. His work is for this reason important,
but is unfortunately inaccurate.
K. Lachmann, the famous classical scholar, opened a new era in
textual criticism in 1842-1850, in his N.T. Graece et Latine.
In this
great book a break was made for the first time with the traditional
text and the evidence of the late MSS., and an attempt was made
to reconstruct the text according to the oldest authorities. This
was a great step forward, but unfortunately it was accompanied
by a retrogression to the pre-Griesbachian (or rather pre-Bengelian)
days;
for Lachmann rejected the idea of grouping MSS., and
having selected a small number of the oldest authorities undertook
always to follow the reading of the majority.
C. Tischendorf, the most famous follower of Lachmann, besides
editions of many MSS. and the collation of many more, published
between 1841 and 1869-1872 eight editions of the New Testament
with full critical notes. The eighth edition, which for the first time
contained the readings of N, has not yet been equalled, and together
with the Prolegomena, supplied by C. R. Gregory after Tischendorf 's
death, is the standard critical edition which is used by scholars
all over the world.
At the same time it must be admitted that
it gradually became antiquated.
Fresh collations of MSS., and
especially fresh discoveries and investigations into the text of the
versions and Fathers, have given much new information which
entirely changed the character of the evidence for many readings,
and rendered a new edition necessary (see Soden, H. von). As a
collector and publisher of evidence Tischendorf was marvellous, but
as an editor of the text he added little to the principles of Lachmann, and like Lachmann does not seem to have appreciated the
value of the Griesbachian system of grouping MSS.
5. P. Tregelks, an English scholar, like Tischendorf, spent almost
his whole life in the collection of material, and published a critical
edition, based on the earliest authorities, at intervals between
1857 and 1872. His work was eclipsed by Tischendorf's, and his
critical principles were almost the same as the German scholar's,
so that his work has obtained less recognition than would otherwise
have been the case. Tischendorf and Tregelles finished the work
which Lachmann began. They finally exploded the pretensions of
the Textus Receptus to be the original text; but neither of them
gave any explanation of the relations of the later text to the earlier,
nor developed Griesbach's system of dealing with groups of MSS.
rather than with single copies.
B. F. Westcott and F. J. A. Hort (commonly quoted as WH), the
Cambridge scholars, supplied the deficiencies of Lachmann, and
without giving up the advantages of his system, and its development by Tischendorf, brought back the study of the text of the
_

[N.T.

CRITICISM

Their great work was
published in 1881 under the title of The New Testament in the Original
Greek. Their view of the history of the text is that a comparison
of the evidence shows that, while we can distinguish more than one
type of text, the most clearly discernible of all the varieties is first
recognizable in the quotations of Chrysostom, and is preserved in
almost all the later MSS. Though found in so great a number of
witnesses, this type of text is shown not to be the earliest or best
by the evidence of all the oldest MS. versions and Fathers, as well
as by internal evidence. Moreover, a comparison with the earlier
sources of evidence shows that it was built up out of previously
existing texts.
This is proved by the " conflations " which are
found in it.
For instance in Mark ix. 38 the later MSS. read
6s ovk aKoKovdel rtfuv, nal e/aoXucra/xe*' avrov otl ovk dnoXovOei ytnv, a
clumsy sentence which is clearly made up out of two earlier
readings, /cat kKoiXOofiev abrov otl ovk rjKoXovdti. 7hui>, found in X BCL
boh., and os ovk a/coAou0et /ze0* itfi&v, ko.1 iKcoXuojuep avrbv, found
in
fam. 1 jam. 11 28 latt. It is impossible, in face of the
fact that the evidence of the oldest witnesses of all sorts is constantly opposed to the longer readings, to doubt that
were
right in arguing that these phenomena prove that the later text was
made up by a process of revision and conflation of the earlier forms.
Influenced by the use of the later text by Chrysostom,
called
it the Syrian or Antiochene text, and refer to the revision which
produced it as the Syrian revision. They suggested that it might
perhaps be attributed to Lucian, who is known to have made a
revision of the text of the LXX.
The earlier texts which were used
for the Syrian revision may, according to
be divided into
three:
(1) the Western text, used especially by Latin writers,
and found also in cod. Bezae and in Syr C
(2) the Alexandrine
text used by Cyril of Alexandria and found especially in CL S 33
and (3) a text which differs from both the above mentioned and
is therefore called by
the Neutral text, found especially in K B
and the quotations of Origen. Of these three types
thought

DX

that the Neutral was decidedly the best.
The Alexandrian was
clearly a literary recension of it, and
strove to show that the
Western was merely due to the non-literary efforts of scribes in other
parts to improve the narrative. The only exception which they
allowed to this general rule was in the case of certain passages,
"
especially in the last chapters of Luke,
the "

WH

Western

where

authorities omit words which are found in the Neutral and Alexandrian texts. Their reason was that omission seems to be contrary
to the genius of the Western text, and that it is therefore probable
that these passages represent interpolations made in the text on
the Neutral side after the division between it and the Western.
They might be called Neutral interpolations, but
preferred the
rather clumsy expression " Western non-interpolations."
Having
thus decided that the Neutral text was almost always right, it only
remained for
to choose between the various authorities which
preserved this type. They decided that the two best authorities
were N and B, and that when these differed the reading of B, except
when obviously an accidental blunder, was probably right. The
great importance of this work of
lies in the facts that it not
merely condemns but explains the late Antiochene text, and that
it attempts to consider in an objective manner all the existing
evidence and to explain it historically and genealogically. Opinions
differ as to the correctness of the results reached by WH, but there
is scarcely room for doubt that as an example of method their work
is quite unrivalled at present and is the necessary starting-point for
all modern investigations.
Since Westcott and Hort no work of the same importance appeared
up till 1909. Various useful texts have been issued, among which
those of Nestle {Novum Testamentum Graece, Stuttgart, 1904), based
on a comparison of the texts of Tischendorf,
and Weiss, and
of Baljon (Novum Testamentum Graece, Groningen, 1898), are the
best. The only serious attempt as yet published to print a complete
text independently of other editors is that of B. Weiss (Das Neue
Leipzig,
Testament,
1894-1900), but the method followed in this
is so subjective and pays so little attention to the evidence of the
versions that it is not likely to be permanently important. The
text reached is not widely different from that of WH.
The new
work in course of preparation by von Soden at Berlin, which promises to take the place of Tischendorf's edition, must certainly do
this so far as Greek MSS. are concerned, for the whole field has been
reinvestigated by a band of assistants who have grouped and collated

known MSS.

WH

Besides these works the chief efforts of textual critics since
have been directed towards the elucidation of minor problems, and

the promulgation of certain hypotheses to explain the characterindividual MSS. or of groups of MSS. Among these
the works of Sanday, Corssen, Wordsworth, White, Burkitt and
Harris on the history of the Old Latin and Vulgate, and especially
the work of Burkitt on the Old Syriac, have given most light on the

section on the apparatus criticus.
Other noteworthy and interistics either of

esting, though in the end probably less important, work has been
done by Blass, Bousset, Schmidtke, Rendel Harris and Chase.
The outline of the chief works is as follows
In his various books on the Acts and third gospel Blass
F. Blass.
has propounded a new theory as to the " Western " text. He was
:

—


struck by the fact that neither the Western can be shown to be derived from the Neutral, nor the Neutral from the Western. He therefore conceived the idea that perhaps both texts were Lucan, and represented two recensions by the original writer, and he reconstructed the history as follows. Luke wrote the first edition of the Gospel for Theophilus from Caesarea: this is the Neutral text of the Gospel. Afterwards he went to Rome and there revised the text of the Gospel and resituated it for the Church in that city: this is the Western (or, as Bliss calls it, Romano-Latin) text. At this time, he also revised the text of the Roman Church, and published the Western text of the Acts. Finally he revised the Acts and sent a copy to Theophilus; this is the Neutral text of the Acts. This ingenious theory met with considerable acceptance, and many learned men regarded the Western text as the primary one until it was shown that “Western” text does not possess the unity which Bliss’s theory requires it to have. Still, Bliss’s textual notes are very important, and there is a mass of material in his books.

Bousset has argued that the readings in the Pauline epistles found in Sinaitic and a few mss are the texts used by Papias, and on the whole this view seems to be highly probable. Another group which Bousset has tried to identify is that headed by B, which connects with the recension of Hesychius, but this theory, though widely accepted in Germany, does not seem to rest on a very solid foundation. The discovery of the “Western” text, together with the results, Schmidtke has tried to show that certain small lines in the margin of B point to a connexion between that MS. and a Greek harmony, which, by assuming that the text of B is Hesychian, he identifies with the “Western” text. It cannot be said that this is a very important theory. Nestle, however, and other scholars think that the lines in B are merely indications of a division of the text into separate paragraphs and have nothing to do with any harmony.

Rendall Harris and Chase. — Two investigations, which attracted considerable attention, were made at this period. The first was an attempt to bring the phenomena of the Western text as due to retranscription from early versions into Greek. Rendall Harris argued for the influence of Latin, and Chase for that of Syriac. While both threw valuable light on obscure points, it is probable that the results of the latter were more certain. At the same time, however little of Rendall Harris’s results may ultimately be accepted by the textual critics of the future, his work will always remain historically of the first importance having done more than any other work to make the study of the Western text a specialty, and to open up a field of research in textual criticism in the last decade of the 19th century.

The time has not yet come when any final attempt can be made to bring all these separate studies together and estimate exactly how much truth there is in any of them. The most that can be said is that the “Western” text cannot be entirely due to retranscription from earlier versions and that the results of the theory are somewhat more than the following lines. The work of WH may be summed up into two theorems: (1) the text preserved by WH is not the only MS. at the period: there is another MS. in the “Western” text, and (2) these earlier texts may be classified as Western, Alexandrian and Neutral, of which the Neutral is the primitive form. The form of these theorems has been generally accepted and may be taken as proved, but the second has been closely criticized and probably there were no such texts against the third. The obvious solution would be to say that two agree their reading is probably correct, but the followings of WH maintain that the agreement of the Western and Eastern is often an agreement in error. It is difficult to see how the two sides can avoid it. The comparison of at least three texts, a Western (geographically), an Eastern and the Neutral. This makes the matter much more difficult; and an answer is demanded to the problem afforded by the agreement of two MSS. against the third. There are two possible ways of doing this: (1) to say that they agree their reading is probably correct, or (2) to say that the agreement of the Western and Eastern are often an agreement in error. It is difficult to see how the two sides can avoid it.
primarily a Greek church. The second stage must be the comparison of these results and the attempt to reconstruct from them a Greek text from which they all arose.

**BIBLIOGRAPHY.**—The literature of textual criticism of the New Testament is so great that only a few of the more important modern books can be mentioned here: H. von Soden, Die Schriften des Neuen Testaments (1900—1897); E. Nestle, Einführung in das griechische Neue Testament (Gottingen, 1899); F. G. Kenyon, Handbook to the Text-criticism of the New Testament (London, 1903); C. R. Gregory, Textkritik des Neuen Testaments (Leipzig, 1900—1892), and D. J. G. F. H. d. N. T. (Leipzig, 1898). For other points especially important (besides books mentioned in the preceding section) see F. Blass, Acta Apostolorum (Gottingen, 1893); and an editio minor, with a valuable preface, Leipsig, 1896). R. W. Schmidtke, Textkritische Studien (Gottingen, 1894); W. Bousset, Textkritische Studien (Leipzig, 1894); B. Weiss, Codex D in der Apostelgeschichte (Leipzig, 1897); A. Port, Der abendländische Text d. Apostelgeschichte (Leipzig, 1900); G. Schilder, Some Thoughts on Text-criticism of the New Testament (London, 1897); Schmidtke, Die Evangelien eines alien Unialcex (Cambridge, 1903).

The New Testament is a series of early Christian writings which the Church came to regard as canonical, i.e. they were placed in the same category as the Old Testament, the writings which the Christian had inherited from the Jewish Church. Just as the ancient Scriptures were considered to be the Word of God, so that what they contained was necessarily the true and inspired doctrine, so also the New Testament was available for proving the Church's dogma. The assured canonicality of the whole New Testament resulted in its use by the medieval theologians, the Schoolmen, as a storehouse of proof-texts. Thus the New Testament seemed to exist in order to prove the Church's conclusions, not to tell its own tale.

The *Novum Instrumentum* published by Erasmus in 1516 (see above, Textual Criticism) contained more than mere Erasmus. Editio Princeps of the Greek text: Erasmus accompanied it with a Latin rendering of his own, in which he aimed at giving the meaning of the Greek without blindly following the conventional phraseology of the Latin Vulgate, which was the only form in which the New Testament had been current in western Europe for centuries. This rendering of Erasmus, together with his annotations and prefaces to the several books, marks his editions the first great monument of modern Biblical study. Medieval Bibles contain short prefaces by St Jerome and others. The stereotyped information supplied in these prefaces was drawn from various sources: Erasmus distinguished between the direct statements in the Acts and the inferences which may be drawn from incidental allusions in the Pauline Epistles, or from the statements of ancient non-canonical writers. This discrimination of sources is the starting-point of scientific criticism.

The early champions of Church reform in the beginning of the 16th century found in the Bible their most trustworthy weapon. The picture of Apostolic Christianity found in the New Testament offered indeed a glaring contrast to the papal system of the later middle ages. Moreover, some of the "authorities" used by the Schoolmen had been discovered by the New Learning of the Renaissance to be no authorities at all, such as the writings falsely attributed to Dionysius the Areopagite. When, therefore, the breach came, and the struggle between reformers and conservatives within the undivided Church was transformed into a struggle between Protestants and Romanists, it was inevitable that the authority which in the previous centuries had been ascribed to the Church

1. E. g. from the preface to the Acts: "Dionysius, bishop of the Corinthians, a very ancient writer, quoted by Eusebius, writes that Paul and Peter obtained the crown of martyrdom by the command of Nero on the same day." And again: "Some industrious critics have added (to the narrative of Acts) that Paul was acquitted at his first trial by Nero. ... This conjecture they make from the 2nd Ep. to Timothy. ..."

2. The phrase is Chillingworth's (1637), who may be described as a Broad High-churchman.

should be transferred by the Reformed Churches to the Bible. "The Bible, the Bible alone, is the religion of Protestants." But really explored the watchwords of the anti-Romanist parties, especially towards the close of the acuter struggle. At the beginning of the movement the New Testament itself had been freely criticized. Luther, like his countrymen of to-day, judged the contents of the New Testament by the light of his leading convictions; and in his German translation, which occupies the same place in Germany as the Authorized Version of 1611 does in English-speaking lands, he even placed four of the books (Hebrews, James, Jude, Apocalypse) in an appendix at the end, with prefaces explanatory of this drastic act of criticism. But though we may trace a real affiliation between the principles of Luther and modern German critical study—namely in the doctrines of the Gospel within the Gospel and of the residual essence of Christianity—Luther's discriminations were in the 17th century ignored in practice.

From cover to cover the whole New Testament was regarded at the beginning of the 18th century by almost all Protestants as the infallible revelation of the true religion. The doctrines of Christianity, and in many communities the customs of the Church, were held to be inferences from the inspired text of the Scriptures. The first serious blow to this view came from the study of textual criticism. The editions of M. W. (1707) and of Weitstein (1751) proved once for all that the doctrines in the text, many of them serious, had existed from the earliest times. It was evident, therefore, that the true authority of the New Testament could not be that of a legal code which is definite in all its parts. More important still was the growing perception of the general uniformity of nature, which had forced itself with increasing insistence upon men's minds as the study of the natural sciences progressed in the 17th and 18th centuries. The miracles of the New Testament, which had formerly been received as bulwarks of Christianity, now appeared as difficulties needing explanation. Furthermore, the prevailing philosophies of the 18th century tended to demand that a real divine revelation should be one which expressed itself in a form convincing to the reason of the average plain man, whatever his predispositions might be; it was obvious that the New Testament did not wholly conform to this standard.

But if the New Testament be not itself the direct divine revelation in the sense of the 18th century, the question still remains, how are we to picture the true history of the rise of Christianity, and what its true meaning is. This is the question which has occupied the theologians of the 19th and 20th centuries. Perhaps the most significant event from which to date the modern period is the publication by Lessing in 1774—1777 of the "Wolfenbüttel Fragments," i.e. H. S. Reimar's posthumous attack on Christianity, a work which showed that the mere study of the New Testament is not enough to compel belief in an unwilng reader. Lessing's publication also helped to demonstrate the weakness of the older rationalist position, a position which really belongs to the 18th century, though its best-remembered exponent, Dr H. E. G. Paulus, only died in 1851. The characteristic of the rationalists was the attempt to explain away the New Testament miracles as coincidences or naturally occurring events, while at the same time they held as tenaciously as possible to the accuracy of the letter of the New Testament narratives. The opposite swing of the pendulum appears in D. F. Strauss: in his *Leben Jesus* (1833) he abandons the shifts and expedients by which the rationalists eliminated the miraculous from the Gospel stories, but he abandons also their historical character. According to Strauss the fulfilments of prophecy in the New Testament arise from the Christians' belief that the Christian Messiah must have fulfilled the predictions of the prophets, and the miracles of Jesus in the New Testament either originate in the same way or are purely mythical embodiments of Christian doctrines.

Influence of textual criticism.

**RATIONALISTS.**
The main objection to this presentation, as also to that of the rationalists, is that it is very largely based not upon the historical data, but upon a pre-determined theory.

Tübingen school

Granting the philosophical basis, the criticism practised upon the New Testament by Paulus and Strauss follows almost automatically. Herein lies the permanent importance of the work of Ferdinand Christian Baur, professor of theology at Tübingen from 1836 to 1860. The corner-stone of his reconstruction of early Christian history is derived not so much from philosophical principles as from a fresh study of the documents. Starting from Galatians and 1 Corinthians, which are obviously the genuine letters of a Christian leader called Paul to his converts, Baur accepted 2 Corinthians and Romans as the work of the same hand. From the study of these contemporary and genuine documents, he elaborated the theory that the earliest Christianity, the Christianity of Jesus and the apostles, was wholly Judaistic in tone and practice. Paul, in his Epistles, was the first to perceive that for Christians Judaism had ceased to be binding. Between him and the other apostles arose a long and fierce controversy, which was healed only when last of the disciples and the Judaizing disciples of the apostles coalesced into the Catholic Church. This only occurred, according to Baur, early in the 2nd century, when the strife was finally allayed and forgotten. The various documents which make up the New Testament were to be dated mainly by their relation to the great dispute. The Apocalypse was a genuine work of John the son of Zebedee, one of the leaders of the Judaistic party, but most of the books were late, at least in their present form. The Acts, Baur thought, were written about A.D. 140, after the memory of the great controversy had almost passed away. All four Gospels also were to be placed in the 2nd century, though that according to Matthew retained many features unaltered from the Judaistic original upon which it was based.

The Tübingen school founded by Baur dominated the theological criticism of the New Testament during a great part of the 19th century and it still finds some support. The main position was not so much erroneous as one-sided. The quarrel between St Paul and his opponents did not last so long as Baur supposed, and the great catastrophe of the fall of Jerusalem effectually reduced thorough-going Judaistic Christianity into insignificance from A.D. 70 onwards. Moreover, St Paul's converts do not seem to have adopted consistent "Paulinism" as a religious philosophy. St Paul was an emancipated Jew, but his converts were mostly Greeks, and the permanent significance of St Paul's theories of law and faith only began to be perceived after his letters had been collected together and had been received into the Church's canon. All these considerations tend to make the late dates proposed by Baur for the greater part of the New Testament books unnecessary; the latest investigators, notably Professor A. Harnack of Berlin, accept dates that are not far removed from the ancient Christian literary tradition.

Literary criticism of the Gospels points to a similar conclusion. A hundred years' study of the synoptic problem, i.e. the causes which make the Gospels according to Matthew, Mark and Luke at once so much alike and so different, has resulted in the demonstration of the priority of Mark, which "was known to Matthew and Luke in the same state and with the same contents as we have it now." This Gospel may be dated a very few years after A.D. 70. Luke and Matthew appear to have been published between 80 and 100. Besides the Gospel of Mark these Evangelists made use of another document, now lost, which contained many sayings of Jesus and some narratives not found in Mark. This document is by many scholars identified with the "Logia," mentioned by Papias (Eus. "Hist. Christi, iii. 39) as being the work of Matthew the Apostle, but the identification is not certain.

1 J. Wellhausen, "Einl. in die drei ersten Evangelien" (1905), p. 57.
2 If Luke used Josephus, as F. C. Burkitt and others believe, the later date must be taken; otherwise the earlier date is more probable, as in any case it must fall within the lifetime of a companion of St Paul.

The subject of the chronology of the New Testament falls naturally into two distinct sections—the chronology of the Gospels, that is, of the life of Christ; and the chronology of the Acts, that is, of the apostolic age.

The Chronology of the Gospels.

The data group themselves round three definite points and the intervals between them: the definite points are the Nativity, the Baptism and the Crucifixion; the age of Christ at the time of the Baptism connects the second and third. The results obtained under the different heads serve mutually to test, and thereby to correct or confirm, one another.

The date of the Nativity as fixed according to our common computation of Anni Domini (first put forward by Dionysius Exiguus at Rome early in the 6th century) has long been recognized to be too late. The fathers of the primitive church had been
BIBLE

But St Luke's account, when the name of Quirinius is subtracted from it, ceases to contain any chronological evidence.

(e) Evidence of Tertullian.—Strangely enough, however, the missing name of the governor under whom the census of the Nativity was carried out appears to be supplied by an author who wrote more than a century after St Luke, and has by no means a good reputation for historical trustworthy. Tertullian, in fact (adv. Marcionem, iv. 19), employs against Marcion's denial of the true humanity of Christ the argument that it was well known that Sentius Saturninus carried out a census under Augustus in Judaea, by consulting which the family and relationships of Christ could have been discovered. This Saturninus was the middle one of the three governors of Syria named above, and as his successor Varus must have arrived by the middle of 6 B.C. at latest (for coins of Varus are extant of the twenty-fifth year of the era of Actium), his own tenures must have fallen about 8 and 7 B.C., and his census cannot be placed later than 7 or 6 B.C. The independence of Tertullian's information about this census is guaranteed by the mere fact of his knowledge of the governor's name; and if there was a census about that date, it would be unreasonable not to identify it with St Luke's census of the Nativity.

The traditional Western day for the Christmas festival, 25th December, goes back as far as Hippolytus (Strom. 1ef. 9. 13) to the traditional Eastern day, 6th January, as far as the Basilidic Gnostics (but in their case only as a celebration of the Baptism), mentioned by Clement of Alexandria, loc. cit.

2. The interval between the Nativity and the Baptism.

Evidence of St Luke's Gospel (iii. 23).—At the time of his baptism Jesus was 秊ξηψκεοσ ἄνεκ ἐκὼ ἄπαξα ἀπόκινοσ, of which words two opposite misinterpretations must be avoided: (i.) ἄπαξα ἀπόκινοσ does not mean (as Valentine interpreters thought, Iren. ii. xxii. 5 [xxiii. 3]; so also Epiphanius, Haer. li. 16) “beginning to be thirty years” in the sense of “not yet quite thirty,” but “at the beginning of His ministry,” as in Luke xxii. 5; Acts i. 22, x. 37; (ii.) ἄνεκ ἐκὼ ἄπαξα ἀπόκινοσ does not mean “on attaining the full age of thirty, before which he could not have publicly taught,” for if there was by Jewish custom or tradition any minimum age for a teacher, it was not thirty, but forty (Bab. Talm. ed. 1715, fol. 19 b; Iren. loc. cit.). St Luke's phrase is a general one, “about thirty years old,” and cannot be so understood to exclude some latitude in either direction.

3. The date of the Baptism.

(a) Evidence of St Luke's Gospel (iii. 1).—A terminus ad quem for the Baptism is the synchronism of the commencement of the Baptist's public ministry with the fifteenth year of the rule (γραμμή) of Tiberius. Augustus died on 19th August A.D. 14, and, reckoned from that point, Tiberius's fifteenth year might be, according to different methods of calculation, either A.D. 28, or 28-29, or 29. But any such result would be difficult to reconcile with the results yielded by other lines of investigation in this article; among alternative views the choice seems to lie between the following:

(i.) The years of Tiberius are here reckoned from some earlier starting-point than the death of his predecessor—probably from the grant to him of co-ordinate authority with Augustus over the provinces made in A.D. 11 (see, for the parallel with the case of Vespasian and Titus, Ramsay, St Paul the Roman Traveller, p. 387), so that the fifteenth year would be roughly A.D. 25; or (ii.) St Luke has made here a second error in chronology, caused perhaps in this case by reckoning back from the Crucifixion, and only allowing one year to the ministry of Christ.

(b) Evidence of St John's Gospel (li. 13, 20).—A terminus ad quem for the Baptism is the synchronism of the first Passover mentioned after it with the forty-sixth year of the building of Herod's Temple. Herod began the Temple in the eighteenth year of his reign, probably 20-19 B.C., and the Passover of the forty-sixth year is probably that of A.D. 27. While too much stress must not be laid on a chain of reasoning open to some uncertainty at several points, it is difficult to suppose with Loisy, Quatrième Évangile, 1903, p. 293, that the number was intended

1 It is a curious coincidence that a medieval Jew, R. Abarbanel (Abarbanel), records that the conjunction of these particular planets in this particular constellation was to be a sign of Messiah's coming. It is just conceivable that his statement may ultimately depend on some such ancient tradition as may have been known to Chaldean magi.
by the evangelist as purely figurative, and is therefore destitute of all historical meaning.

On the whole, the Baptism of Christ should probably be placed in January—June; and as the Nativity was placed in 7-6 B.C. (at latest), this would make the age of Christ at his Baptism to be about thirty-two, which tallies well enough with St. Luke's estimate.

4. The interval between the Baptism and the Crucifixion, or, in other words, the duration of the public ministry of Christ.

(a) Evidence of the Synoptic Tradition and of St Mark's Gospel (ii. 23, vi. 39, xiv. 1).—The order of events in the primitive synoptic tradition appears to be faithfully reproduced in St Mark; and if this order is chronological, Christ's ministry lasted at least two years, since the plucking of the ears of corn (April-June) marks a first spring; the feeding of the five thousand was at the end of the second spring (John vi.); the Passover of Christ's third year; and these three points are so far removed from one another in the narrative that the conclusion would hold, even if the general arrangement in St Mark were only roughly, and not minutely, chronological. On the other hand, it may be true that an impression of a brief period of ministry naturally results, and in early generations did actually result, from the synoptic account considered as a whole.

(b) Evidence of St Luke's Gospel (ix. 51—xix. 28 compared with iv. 14—ix. 50; iv. 19).—Still stronger is the impression of brevity suggested by St Luke. The second and larger half of the narrative of the ministry is introduced at ix. 51 with the words, "It came to pass as the days of His assumption were coming to the full, He set His face firmly to go to Jerusalem," under which phrase the evangelist cannot have meant to include more than a few months, perhaps not more than a few weeks; so that even if the earlier and shorter half of the account, which describes a purely Galilean ministry ("Judea" in iv. 44, if it is the true reading, means Judea in the sense of Palestine), is to be spread over a longer period of time, the combined narrative can hardly have been planned on the scale of more than a single year. St Luke himself may have understood literally, like so many of his readers in ancient times, the reference which he records to the "acceptable year of the Lord" (iv. 15—Isa. lx. 2); see, too, above, 3 (a) ad fin.

(c) Evidence of St John's Gospel (ii. 13, "the Passover of the Jews was near," and 23, "He was in Jerusalem at the Passover at the feast"); v. 1, "after these things was a feast [or: the feast] of the Jews"; vi. 4, "and the Passover, the feast of the Jews, was near"); vii. 2, "and the feast of the Jews, the Tabernacles, was near"); x. 22, "at that time the feast of dedication took place at Jerusalem"); xi. 55, "and the Passover of the Jews was near": besides iv. 35, "say ye not that there is yet a period of four months and harvest cometh? behold, I tell you, lift up your eyes and see the fields that are white to harvest"). This catena of time-references is of course unique in the Gospels as a basis for a chronology of the ministry; and it is not reasonable to doubt (with Loisy, loc. cit., who suggests that the aim was to produce an artificial correspondence of a three and a half years' ministry with the half-week of Daniel; but many and diverse are the early interpretations of Daniel's seven weeks) that the evangelist intended these notices as definite historical data, possibly for the correction of the looser synoptic narratives and of the erroneous impressions to which they had given rise. Unfortunately, difficulties, either (i.) of reading, or (ii.) of interpretation, or (iii.) of arrangement, have been raised with regard to nearly all of them; and these difficulties must be briefly noticed here.

(i.1) Readings (a) v. 1, ἐκβολή A B D, Origen, Epiphanius, Chrysostom, Polyaenus, Cyril of Jerusalem, Epiphanius, Cyril-Alex. (Ireneaus). The balance of internal evidence —copies being more likely to accented than to diminish the precision of a note of time—ineflects, like the balance of external evidence, against the article. (b) vi. 4, ἑτερον is read by all known MSS. and versions, but it has been argued by Hort (in Westcott's and Hort's New Testament in Greek, appendix, pp. 77-81) that four ancient authorities omitted the words, and that their omission simplifies the whole chronology, since "the feast" which was "near" in vi. 4 would then be identical with the feast of Tabernacles mentioned in vii. 2, and all the time-notices of the Gospel could be arranged to fall within the space of a single year, between the Passover of li. 13 and the Passover of xi. 55. But of the four authorities alleged, Ireneaus (ii. xxii. 3 [xxxii. i]) and the Alogoi (ap. Epiphanius, Hær. ii. 22) were giving catalogues of Passovers "observed" by Christ (at Jerusalem), and therefore naturally omitted a mere "notion" of a technical reference, like E. Cyril of Alexandria, i.e., in so far as his evidence is adverse to the words, "there is not in all, the only writer who perhaps really did omit the words—with the view, no doubt, of reconciling the witness of the four Gospel with the wider spread tradition of the single-year ministry—is Ireneaus himself.

(iii.2) Interpretation (a) iv. 35: which is to be taken literally, the "four months to harvest" (about January), or the "feast" of harvest (about May). It does not necessarily follow from this interpretation that the choice between them will follow from the view taken of the general chronological arrangement of the Gospel. (b) v. i: if the feast (v. 1) is read, a choice remains between Passover and Tabernacles (the definite article would not be very definite after all); if the more probable "a feast," the greater feasts are presumably excluded, but a choice remains between, at any rate, Pentecost (May), Trumpets (September), Dedication (December) and Purim (February). Hence again the decision will follow occur in the general chronological arrangement which may be adopted.

(iii.3) Arrangement.—So far the amount of possible latitude left is not so great as to obscure the main outline of the chronology. For the first and second, and second and third determinate notices (vii. 2 Tabernacles in October, x. 22 Dedication in December) between the second and third, the evidence is given in the notes. The desiring desire has been manifested, especially in Germany and America, to compare the two accounts on the grounds of a special arrangement which may be adopted. From this section among the essential materials is that which has been illustrated from the earliest instance of the former and one of the latest of the latter. In 1871 Archdeacon J. P. Norris (Journal of Biblical Literature, vii. 350) suggested that the data should be considered as chronological, and a speculum like cl. xx., a Galilean appendix, and was inserted by mistake at some point in the body of the Gospel—and to read "the feast" (v. 1) it that the Passover with which the feast which was 4:21—Pentecost was read in v. 1, the translation would not affect the two years' ministry. In 1900 Professor B. W. Bacon (American Journal of Theology, p. 770) proposed a rearrangement of the whole (February) (J. P. Norris, loc. cit., table, showing 1) the arrangement as a whole) but such a scheme does not lend itself to discussion here; but as far as the possibility of a story does not affect the arrangement as a whole, it the fourth evangelist drew up his narrative on the basis of a two year's rather than a one year's ministry appears to be irrefragable.

Not only do the fourth and second Gospels thus agree in indications of a two years' ministry, but the notes of the middle spring of the three (John vi. 4; Mark vi. 29) both belong to the feeding of the 8000, one of the few points of actual contact between the two Gospels.

The question, however, may still be raised, whether these time-references of the two Gospels are exhaustive, whether (that is) two years, and two years only, are to be allotted to the ministry. Ireneaus (ii. xxii. 3—6 [xxxii. i-4]), in favour of a ministry of not less than ten years, appeals (i.) to the tradition of Asia Minor; (ii.) to the record in St John that Christ, who was thirty years old at the time of his baptism, was addressed by the Jews as "not yet [i.e. nearly] fifty years old"; but both his arguments are probably derived from a single source, Papia's interpretation of John viii. 57. With this exception, however, all ancient writers, whether they enumerated two or three or four Passovers in the Gospel history, believed that the enumeration was exhaustive; and their belief appears correctly to represent the mind of the author of the Fourth Gospel, seeing that his various notices of time were probably in intentional contrast to the looser synoptic accounts. Moreover, the wide currency in early times of the tradition of the single-year ministry (Ptolemaeus).
ness of the season from year to year. (ii) The difficulty with regard to the day is, quite similarly, to know what precise relation the first day of the Jewish month bore to the astronomical new moon. In later Christian times the Paschal month was calculated from the astronomical new moon; in earlier Jewish times all months were reckoned to begin at the first sunset when the new moon was visible, which in the most favourable circumstances would be some hours, and in the most unfavourable three days, later than the astronomical new moon.

Direct material for answering the question when and how far astronomical calculations replaced simple observations as the basis of the Jewish calendar is not forthcoming. Jewish traditions represented the Sanhedrin as retaining to the end its plenary power over the calendar, and as still fixing the first day of every month and the first month of every year. But as it is quite inconceivable that the Jews of the Dispersion should not have known beforehand at what full moon they were to present themselves at Jerusalem for the Passover, it must be assumed as true in fact, whether or not it was true in theory, that the old empirical methods must have been qualified, at least partially, by the use of astronomical rules. Exactly what modifications were first made in the system under which each month began by simple observation of the new moon we do not know, and opinions are not agreed as to the historical value of the rabbinical traditions; but probably the first step in the direction of astronomical precision would be the rule that no month could consist of less than twenty-nine or more than thirty days—to which appears to have been added, but at what date is uncertain, the further rule that Adar, the month preceding Nisan, was always to be limited to twenty-nine. In the same way the beginning of the Jewish year according to the state of the harvest was supplanted by some more fixed relation to the solar year. But this relation was not, it would seem, regulated by the date, real or supposed, of the equinox. Christian controversies from Antonius of Laodicea (A.D. 277) onwards accused the Jews of disregarding the (Christian) equinoctial limit, and of sometimes placing the Paschal full moon before it; and it is possible that in the time of Christ the 14th of Nisan might have fallen as far back as the 17th of March. In the following table the first column gives the terminus paschalis, or 14th of the Paschal month, according to the Christian calendar; the second gives the 14th, reckoned from the time of the astronomical new moon of Nisan; the third the 14th, reckoned from the probable first appearance of the new moon at sunset. Alternative moons are given for A.D. 29, according as the full moon falling about the 18th of March is or is not reckoned the proper Paschal moon.

A.D. 28 Sat. Mar. 27 Mar. 28 Mar. 30
A.D. 29 Th. Mar. 17 Mar. 18 Mar. 19
A.D. 33 W. Ap. 1 Ap. 2 Ap. 3 or 4

It will be seen at once that Friday cannot have fallen on Nisan 14th in any of the three years A.D. 28, 31 and 32. The choice is narrowed down to A.D. 29, 15th March (Friday, 15th April), would seem to be too early even for the 14th of Nisan; A.D. 30, 17th April; and A.D. 31, 19th April.

(c) The Civil Year (consuls, or regnal years of Tiberius) in early Christian tradition. It is not a priori improbable that the year of the central event from which the Christian Church dated her own existence should have been noted in the apostolic age and handed down to the memory of succeeding generations; and the evidence does go some way to suggest that we have in favour of A.D. 29, the consulate of the two Gemini (15th or 16th year of Tiberius), a body of tradition independent of the Gospels and ancient, if not primitive, in origin.

The earliest witness, indeed, who can be cited for a definite date for the crucifixion gave not 29, but 33 A.D. The pagan chronicler, Philemon, writing in the reign of Hadrian, noted under Olympiad 202:4 (= A.D. 33–34), besides a great earthquake in Bithynia, an eclipse so remarkable that it became night
“at the sixth hour of the day.” The eclipse meant, is presumably, that of the Crucifixion (so Origen, contra Celsum, ii. 33 [but see in Matt. 134; Delaroche, ii. 92, Tertullian, Chir. de Sacer. 18]; BArch. in Cateni, p. 237), but the notice is not clearly seen by Phlegon, pagan as he was, directly or indirectly from the Gospel narrative, there is no reason to ascribe any independent value to the date. Phlegon may have had grounds for dating the Bithynian earthquake in that year, and have brought the dateless portent into connexion with the dated one. Eusebius adopted and popularized this date, which fell in with his own system of Gospel chronology, but of the year 33 as the date of the Passion there is no vestige in Christian tradition before the 4th century.

The only date, in fact, which has any real claim to represent Christian tradition independent of the Gospels, is the year 29. Tiberius 15 is given by Clem. Alex. Strom. i. 147; Origen, Hom. in Jerem. xiv. 13; cf. c. Cels. iv. 22. Tiberius 16 by Julius Africanus (Routh, Diet. Sacr. ii. 301-304), and pseudo-Cyprian, Paschal cycle (A.D. 243), § 20. The consulship of the two Gemini by Lactantius, Div. Inst. iv. x. 18, and (Lactantius?) de morte pers. § 2; the consulsip of the two Gemini—Tiberius 15, 16—by Hippolytus, Comm. in Danielem, iv. (ed. Bonwetsch, p. 242); the consulsip of the two Gemini—Tiberius 15 by [Tertullian] adv. Judaeos, § 8; the consulsip of the two Gemini—Tiberius 15 (al. 18 or 19) = O.lical. 12 (this last is a later interpolation from Eusebius) in the Acts of Pilate. Other methods of expressing the year 29 appear in Hippolytus’s Paschal Cycle and Chronicle, and in the Agbar legend (ap. Eusebius, H.E. i. 13). No doubt it would be possible to explain Tiberius 16 as a combination of Luke iii. 1 with a one-year ministry, and even to treat Tiberius 15 as an unintelligible repetition from St Luke—though the omission to allow a single year for the ministry would be so strange as to be almost unintelligible—but the date by the consuls has an independent look about it, and of its extreme antiquity the evidence gives two indications: (i.) Hippolytus’s Commentary on Daniel (now generally dated c. A.D. 200) combines it with an apparently inconsistent date, Tiberius 18; the latter is clearly his own combination of the length of the ministry (he says in the same passage that Christ suffered in his 33rd year) with Luke iii. 1—the consulsip must have been taken from tradition without regard to consistency; (ii.) the names of the Gemini are divergently given in our oldest authorities; in [Tert.] adv. Judaeos correctly as Rubellius Geninus and Futius (or Rufius) Geninis, but in Hippolytus and the Acts of Pilate as Rufus and Rubello. But if the tradition of the consulsip was thus, it would seem, already an old one about the year 200, there is at least some reason to conclude that trustworthy information in early Christian chronology, independently of the Gospels, to the year 29 as that of the Crucifixion.

(f) The Civil Month and Day.—The earliest known calculations, by Basiliad Gnostics, quoted in Clem. Alex. Strom. i. 147, gave alternative dates, Phamenoth 25, Pharmuthius 25, Pharmuthius 19; that is, according to the fixed Alexandrine calendar of e.c. 26, 21st March, 20th April, 14th April; in the older, not wholly superseded, Egyptian calendar the equivalents with Roman days varied from year to year. But all probability these dates were only one development of those speculations in the region of numbers to which Gnosticism was so prone; and in any case to look for genuine traditions among Egyptian Gnostics, or even in the church of Alexandria, would be to misunderstand the history of Christianity in the 2nd century. Such traditions must be found, if anywhere, in Palestine and Syria, in Asia Minor, in Rome, not in Egypt; within the Church, not among the Gnostics. The date which makes the most obvious claim to satisfy these conditions would be the 25th of March, as given by Hippolytus, [Tert. adv. Judaeos, and the Acts of Pilate (according to all extant MSS. and versions, but see below), loc. cit.—the same three authorities who bear the earliest witness for the consuls of the year of the Crucifixion, and by many later writers. It cannot be correct, since no full moon occurs near it in any of the possible years; yet it must be very early, too early to be explained with Dr Salmon (Dictionary of Christian Biography, iii. 928), as originated by Hippolytus’s Paschal cycle of A.D. 174, and Eusebius (Harr. 1. 7) had seen copies of the Acts of Pilate in which the day given was not 25th March, but a.d. 29. a.p. (18th March) and if this was the primitive form of the tradition, it is easy to see how 25th March could have grown out of it, since the 18th would from comparatively early times, in the East at any rate, have been thought impossible as falling before the equinox, and no subtitution would be so natural as that of the day week, Friday, 25th March. But Friday, 18th March, A.D. 29, was one of the three alternative dates for the Crucifixion which on astronomical and calendar grounds were found (see above, §d) to be possible.

Thus A.D. 29 is the year, the 18th of March is the day, to which Christian tradition (whatever value, whether much or little, he ascribed to it) appears to point. Further, the Baptism was tentatively placed in A.D. 26-27; the length of the ministry was fixed, with some approach to certainty, at between two and three years, and here too the resultant date for the Crucifixion would be the Passover of A.D. 29.

To sum up: the various dates and intervals, to the approxi- mation of determination of which this article has been devoted, do not claim separately more than a tentative and probable value. But it is submitted that their harmony and convergence give some additional claim to acceptance, and at any rate do something to secure each one of them singly—the Nativity in 5-6 B.C., the Baptism in A.D. 26-27, the Crucifixion in A.D. 29—from being to any wide extent in error.

The Chronology of the Apostolic Age.

The chronology of the New Testament outside the Gospels may be defined for the purposes of this article as that of the period between the Crucifixion in A.D. 29 (30) on the one hand, and on the other the persecution of Nero in A.D. 64 and the fall of Jerusalem in A.D. 70. Of the events in Christian history which fall between these limits it must be admitted that there are many which with our present information we cannot date with exactness. But the book of Acts, our only continuous authority for the period, contains two synchronisms with secular history which can be dated with some pretence to exactness and constitute fixed points by help of which a more or less complete chronology can be constructed for at least the latter half of the apostolic age. These are the death of Herod Agrippa I. (xii. 23) and the replacement of Felix by Festus (xxiv. 27).

1. The death of Herod Agrippa I. This prince, son of Aristobulus and grandson of Herod the Great, was made, was "king over the tetrarchy which had been Herod Philip’s, “not many days” after the accession of Tiberius, 16th of March A.D. 37; (ii.) ruler of the tetrarchy of Antipas, in A.D. 39-40; (iii.) ruler of the whole of Palestine (with Abilene), on the accession of Claudius at the beginning of A.D. 41. Josephus’s Jewish Wars and Antiquities differ by one in the number of years they allot to his reign over the tetrarchies (the former work says three years, the latter four), but agree in the more important datum that he reigned three years more after the grant from Claudius, which would make the latest limit of his death the spring of A.D. 44. The Antiquities also place his death in the seventh year of his reign, which would be A.D. 43-44. On the other hand, coins whose genuineness there is no apparent reason to doubt are extant of Agrippa’s ninth year; and this can only be reconciled even with A.D. 44 by supposing that he commenced reeking a second year of his reign on Nisan 1, A.D. 37, so that his ninth would run from Nisan 1, A.D. 44. On the balance of evidence the only year which can possibly reconcile all the data appears to be A.D. 44 after Nisan, so that it will have been at the Passover of that year that St Peter’s arrest and deliberation took place.

After Agrippa’s death Judaea was once more governed by procurators, of whom Cuspius Fadus and Tiberius Alexander ruled from A.D. 44 to 48; the third, Cumanus, was appointed in A.D. 48; and the fourth, Felix, in A.D. 52. Under Tiberius
BIBLE

[IN, T. CHRONOLOGY]

Alexander, &c. in A.D. 46 or 47, occurred the great famine which Agabus had foretold, and in which the Antiochene church sent help to that of Jerusalem by the ministry of Barnabas and Saul (Acts xi. 30. xii. 25). Thus the earliest date at which the commencement of the first missionary journey (Acts xii. 4) can be placed is the spring of A.D. 47. The journey extended from Salamis "throughout the whole island" of Cyprus as far as Paphos, and on the mainland from Pamphylia to Pisidian Antioc, Iconium, Lystra and Derbe, at each of which places indications are given of a prolonged visit (xiii. 49. xiv. 3, 6, 7, 21). The same as Perga in reverse order on the return journey, as far as Perga on the Pamphylian coast; but instead of revisiting Cyprus the voyage to Syria was this time made direct. In estimating the length of time occupied by this first missionary journey, it must be remembered that a sea voyage could never have been undertaken, and land travel only rarely, during the winter months, say November to March; and as the amount of the work accomplished is obviously more than could fall within the travelling season of a single year, the winter of 47-48 must have been spent in the interior, and return to the coast and to Syria made only some time before the autumn A.D. 48. The succeeding winter, at least, was spent again at Antioch of Syria (xiv. 28). The council at Jerusalem of Acts xv. will fall earliest in the spring of A.D. 49, and as only "certain days" were spent at Antioch after it (xv. 36) the start on the second missionary journey might have been made in the (late) summer of the same year. The "confirmation" of the existing churches of Syria and Cilicia, and of those of the first journey beginning with Derbe (xv. 41, xvi. 5), cannot have been completed under several months, nor would the Apostle have commenced the strictly missionary part of the journey in districts not previously visited, before the opening of the travelling season of A.D. 50. No delay was then made on the Asiatic side: it may still have been in spring when St Paul crossed to Europe and began the course of preaching at Philippi, Thessalonica, Berœa and Athens which finally brought him to Corinth. The stay of eighteen months at the last-named place (xviii. 11) will naturally begin at the end of one travelling season and be at the beginning of another, i.e. from the autumn of A.D. 50 to the spring of A.D. 52. From Corinth the Apostle went to Jerusalem to "salute the church," and then again to Antioch in Syria, where he stayed only for "a time" (xviii. 22), and soon left—on the third missionary journey, as conventionally reckoned—proceeding "in order" through the churches of the interior of Asia Minor. These journeys and the intervening halts must have occupied seven or eight months, and it must have been about the end of the year when St Paul established his new headquarters at Ephesus. The stay there lasted between two and three years (xix. 8, 10. xx. 31), and cannot have terminated before the spring of A.D. 55. From Ephesus he went into Europe, and after "much teaching" given to the churches of Macedonia (xx. 2), spent the three winter months at Corinth, returning to Philippi in time for the Passover (xx. 3, 6) of A.D. 56. Pentecost of the same year was spent at Jerusalem, and there St Paul was arrested and taken before Felix, governor of Judea, for one year, until Felix succeeded Cumanus as governor (xx. 16, 22. xxi. 47), and event which, on this arrangement of the chronology of the missionary journeys, would therefore fall in A.D. 58.

Care, however, must be taken to remember exactly what this line of argument amounts to—what it can fairly be said to have proved, and what it still leaves open. It has been shown, firstly, that the missionary journeys cannot have commenced before the spring of A.D. 47, and, secondly, that between their commencement and the end of the two years' imprisonment at Caesarea not less than eleven full years must have elapsed. Consequently A.D. 58 appears to be the earliest date possible for the arrival of Felix. On the other hand, a later date for Festus is not absolutely excluded. It is possible that the first missionary journey should be placed in A.D. 48 instead of A.D. 47; and it is possible, though not probable, that the missionary journeys should be spread over one year more than has been suggested above. At any rate, then, the alternative is open that every date given above, from A.D. 47 to A.D. 58, should be moved on one year, with the result of placing Felix's arrival in A.D. 59.

It now time to run to the direct evidence for the date of Festus's arrival as pope, in order to test by it the result already tentatively obtained.

2. The replacement of Felix by Festus. This is the pivot date of St Paul's later life, but unfortunately two schools of critics date it as differently as A.D. 55 and A.D. 60 (or 61). The former are represented by Harnack, the latter by Wieseler, whom Lightfoot follows. It can be said confidently that the truth is between these two extremes (though in what exact year it is not easy to say), as will be evident from a consideration of the arguments urged, which in each case appear less to prove one extreme than to disprove its opposite.

Arguments for the Later Date, A.D. 60 or 61.—(a) St Paul, at the time of his arrest, two years before Felix's recall, addresses him as "the bishop of Rome" (Rom. 16. 20). It is certain that Felix succeeded Cumanus in A.D. 52, for Tacitus mentions Cumanus's recall under that year, Josephus immediately before the notice of the completion of Claudius's twelfth year (Jewish Antiquities, xvi. 5), Eusebius the revolt of "the Macedonian" St Claudius in 11, that is, between September 51 and September 52 (for A.D. 55 and 56) of the regnal years in the Chronicle of Eusebius see the present writer's article in Journal of Theological Studies, January 1900, pp. 188-192). It is not possible that Felix could have been "bishop of Rome" for more than six or seven years, so that St Paul must have been in Rome at least by 59, and Felix will have left Judea at earliest in 60 or 61. But this argument overlooks the fact that Felix had been in some position which might properly be described as that of "judge for this nation" before he became governor of all Judea in scenery. Felix was at the time of that appointment tamprimus Judaœorum impositions (Annals, xii. 54): he certainly supposes Felix to have been already governor of Samaria, and apparently of Judea too, and he treats the fact that he has to go to Felix, as a reason for urging him to govern well, the fact he had that for his appointment to the procuratorship (Ant. xxvii. 7). If Felix had acted in some position of responsibility in Palestine before his recall, as Eusebius implies, it is possible that he may have been spoken of as "many years" at least as early as 56 or 57.

(b) Josephus enumerates after the accession of Nero (October 54) a long catalogue of events which all took place under the procuratorship of Felix (Ant. xxvii. 6). It is, therefore, necessary for Josephus to press on Felix, as a reason for urging him to govern well, the fact he had that for his appointment to the procuratorship (Ant. xxvii. 7). If Felix had acted in some position of responsibility in Palestine before his recall, as Eusebius implies, it is possible that he may have been spoken of as "many years" at least as early as 56 or 57.

The arguments, then, brought forward in favour of A.D. 60 or 61 do not do more than bring the rule of Felix down to 58 or 59.

Arguments for an Early Date, A.D. 55 or 56.—(a) Eusebius's Chronicon places the arrival of the heathenized to press on Felix, as a reason for urging him to govern well, the fact he had that for his appointment to the procuratorship (Ant. xxvii. 7). If Felix had acted in some position of responsibility in Palestine before his recall, as Eusebius implies, it is possible that he may have been spoken of as "many years" at least as early as 56 or 57.

(b) St Paul, on his return to Rome, was prosecuted by the Jews for misgovernment, but was acquitted by the influence of his brother Pallas. Pallas had been minister and favourite of Claudius,

1 Dr C. Erbes (Texte und Untersuchungen, new series, iv. 1) attempts to interpret the evidence of Eusebius in favour of the later date for Felix's arrival by the following: Eusebius's date for Festus is to be found in Neron 1, by striking a mean between the French (Neron 1, 2) and the Latin, Nero 2; it is really to be understood as reckoned, not by years of Nero, but by years of Agrippa; and as Eusebius erroneously antedated Agrippa's reign by five years, commencing it with A.D. 45 instead of A.D. 30, his date for Festus's arrival fell up (and should be moved to Nero 6, A.D. 59-60). The whole of this theory appears to the present writer to be a gigantic mare's nest: see Journal of Theological Studies (October 1901), pp. 120-123.
but was removed from office in the winter following Nero’s accession, 54–55. Felix must therefore have tried at the very beginning of Nero’s reign. But this argument would make Felix’s recall—if Festus came in summer, as Acts xxv, 1, xxvii, 1, 9, seem to prove—fail totally under Claudius. And, in fact, it would be a mistake to look upon Pallas’ retirement as a disgrace. He stipulated that no inquiry should be made into his conduct in office, and was left for another seven years un molested in the enjoyment of the fortune he had amassed. There is, therefore, every likelihood that he retained for some time influence sufficient to shield his brother.

Of these arguments, then, the first, so far as it is valid, is an argument for the summer, not of A.D. 55 or 56, but of A.D. 57 as that of the recall, while the second will apply to any of the earlier years of Nero’s reign.

In the result, then, the arguments brought forward in favour of each extreme fail to prove their case, but at the same time prove something against the opposite view. Thus the point that Josephus catalogues the events of Felix’s procuratorship under Nero cannot be pressed to bring down Felix’s tenure as far as 60 or 61, but it does seem to exclude as early a termination as 56, or even 57. Conversely, the influence of Pallas at court need not be terminated by his ceasing to be minister early in 55; but it would have been overshadowed not later than the year 60 by the influence of Poppaea, who in the summer of that year enabled the Jews to win their cause in the matter of the Temple wall, and would certainly have supported them against Felix. Thus the choice again appears to lie between the years 58 and 59 for the recall of Felix and arrival of Festus.

If St Paul was arrested in 56 or 57, and appealed to Caesar on the arrival of Festus in 58 or 59, then, as he reached Rome in the early part of the year following, and remained there a prisoner for two full years, we are brought down to the early spring of either 61 or 62 for the close of the period recorded in the Acts. That after these two years he was released and visited Spain in the west, and in the east Ephesus, Macedonia, Crete, Troas, Miletus, and perhaps Achaia and Ephesus, is probable, in the one case, from the evidence of Romans xv. 28, Clem. ad Cor. v. and the Muratorian canon, and in the other, from the Pastoral Epistles. These journeys certainly cannot have occupied less than two years, and it is more natural to allow three for them, which takes us down to 64–65.

Early evidence is unanimous in pointing to St Peter and St Paul as victims of the persecution of Nero (Clem. ad Cor. v. vi., Dionysius of Corinth ap. Eus. H.E. ii. 25, &c., combined with what we know from Tacitus of the course of the persecution, and from Gaius of Rome, ap. Eus. ii. 25, of the burial-places of the two apostles); and tradition clearly distinguished the fierce outbreak at Rome that followed on the fire of the city in July 64 from any permanent disabilities of the Christians in the eye of the law which the persecution may have initiated. There, therefore, no reason at all to doubt that both apostles were martyred in 64–65, and the date serves as a confirmation of the chronology adopted above of the imprisonment, release and subsequent journeys of St Paul.

Investigation, then, of that part of the book of Acts which follows the death of Agrippa, recorded in chap. xii.—i.e. of that part of the narrative which follows the narrative of the apostles—is seen to be possible without that apparent difficulties can be to a large extent set aside, and that there is nowhere room between A.D. 44 and 64 for doubt extending to more than a single year. The first missionary journey may have begun in 47 or 48; the arrival of Festus may have taken place in the summer of 58 or of 59; the two years of the Roman imprisonment recorded in the last chapter of Acts may have ended in the spring of 61 or 62; and the dates which fall in between these extremes are liable to the same variation.

The present writer leans to the earlier alternative in each case, 47, 58, 61; but he willingly concedes that the evidence, as he understands it, is not inconsistent with the later alternative.

But if the events of A.D. 44–64 can thus be fixed with a fair approximation to certainty, it is unfortunately otherwise with the events of A.D. 29–44. Here we are dependent (i.) on general indications given in the Acts; (ii.) on the evidence of the Epistle to the Galatians, which, though in appearance more precise, can be and is interpreted in very different ways.

(i.) The book of Acts is divided, by general summaries from time to time inserted in the narrative, into six periods: i. 1–vi. 7, vi. 8–ix. 31, ix. 32–xii. 24, xii. 25–xvi. 5, xvi. 6–xix. 20, xix. 21–xxviii. 31. Of these the last three extend respectively from the death of Herod to the start for Europe in the second missionary journey (A.D. 44 to the spring of 50 [i.]), from the start for Europe to the end of the long stay at Ephesus (A.D. 50 [i.] to the spring of A.D. 55 [ii.]), and from the departure from Ephesus to the end of the two years’ captivity at Rome (A.D. 55 [iii.] to the beginning of A.D. 61 [iv.]). It will be seen that these periods are of more or less the same length, namely, six (or seven) years, five years, six years. There is, therefore, some slight presumption that the three earlier periods, which together cover about fifteen years, were intended by so artistic a writer as St Luke to mark each some similar lapse of time. If that were so, the preaching of the apostles at Jerusalem and organization of the Church at the capital—the preaching of the seven and the extension of the Church all over Palestine—the extension of the Church to Antioch, and the commencement of St Paul’s work—might each occupy five years more or less, that is to say, roughly, A.D. 29–34, 34–39, 39–44. The conversion of St Paul, which falls within the second period, would on this arrangement fall somewhere between five and ten years after the Crucifixion. Such conclusions are, however, of course general in the extreme.

(ii.) A nearer attempt to date at least the chronology of St Paul’s earlier years as a Christian could be made by the help of the Galatian Epistle if we could be sure from what point and to what point its reckonings are made. The apostle tells us that on his conversion he retired from Damascus into Arabia, and thence returned to Damascus; then after three years (from his conversion) he went up to Jerusalem, but stayed only a fortnight, and went to the regions of Syria and Cilicia. Then after fourteen years (from his conversion? or from his last visit?) he went up to Jerusalem again to confer with the elder apostles. Now, if either of these visits to Jerusalem could be identified with any of the visits whose dates have been approximately settled in the chronology of A.D. 44–64, we should have a fixed point from which to argue back. Unfortunately, even less agreement exists on this head than on the question whether the fourteen years of the last-mentioned visit are to be reckoned from the conversion or from the previous visit. Most critics, indeed, are now agreed that the fourteen years are to be calculated from the conversion; and most of them still hold that the visit of Galatians ii. is the same as the council of Acts xv., partly, no doubt, on the ground that the latter visit was too important and decisive for St Paul to have omitted in giving even the most summary description of his relations with the twelve. This ground would, however, be cut away from their feet if it were possible to hold (with J. V. Bartlett, Apostolic Age, 1900, and V. Weber, Die Abfassung des Galaterbriefs vor dem Apostelkoncil, Ravensburg, 1900) that the epistle was actually written just before the council, i.e. in the winter of 48–49 [49–50]. In that case, of course, the two visits of Galatians i. and ii. would be those of Acts ix. 26 and xi. 30. The fourteen years reckoned back from the latter (c. A.D. 46) would bring us to A.D. 32–33 as the latest possible date for the conversion. With the older view, on the other hand, the fourteen years reckoned from the council in A.D. 40 [50] would allow us to bring down the conversion to A.D. 36. The new view clears away some manifest difficulties in the reconciliation of the Epistle and the Acts, and the early date for Galatians in relation to the other Pauline epistles is not so improbable as it may seem; but the chronology still appears more satisfactory on the older view, which enables the conversion to be placed at least three years later than on the alternative theory. But it is clear that the last word has not been said, and that definite results for this period cannot yet be looked for.

To sum up: an attempt has been made, it is hoped with some success, to provide a framework of history equipped with dates from the time of St Peter’s arrest by Herod Agrippa I. at the
Passover of A.D. 44 down to the martyrdom of St Peter and St Paul in the persecution of Nero, A.D. 64-65. For the previous period, on the other hand, from A.D. 29 to A.D. 44, it appeared impossible in our present state of knowledge to state conclusions other than in the most general form.

 Authorities.—The views stated in this article are in general (though with some modifications) the same as those which the present writer worked out more fulness of detail in Hastings' *Dictionary of the Bible*, i. (1898) 403-424. Of older books should be noted—Ideler, *Thomaischem deutschem historischen Chronologien* (2 vols., 1825); Wissler, *Chronologie des apostolischen Zeitalters* (1848); Lewin's *Fasti Sacri* (1865). Important modern contributions are to be found in Prof. (Sir) W.M. Ramsay's *Two of His Works*, and in Harnack's *Chronologie der historischen Litteratur bis Eusebios*, i. 233-244. Mention should also be made of an article, containing much useful astronomical and Talmudical information, by Mr J. K. Fotheringham, "The Date of the Crucifixion," *in the Journal of Philology*, xxix. 100-118 (1900). Mr. Fotheringham is of opinion that the evidence from Christian sources is too uncertain, and that the statements of the Mishnah must be the starting-point of the inquiry: taking then the phase of the new moon as the true beginning of Nissan, he concludes that Friday cannot have coincided with Nissan 1 in any year, within the period A.D. 22-35, other than A.D. 33 (April 9th). But in one of the two empirical tests of the value of these calculations that he was able to obtain (loc. cit, p. 100, note 2), the new moon was a day earlier than that given in the Mishnah. This being so, it would be premature to disregard the convergent lines of historical evidence which tell against A.D. 33. Among the latest German works may be cited the chapter on New Testament chronology in the *Neutestamentliche Zeitgeschichte* of Dr. Holzmann (Halle, 1900). If this work is regarded as a collection of historical material this deserves every praise, but the mass is digested and the treatment of the evidence arbitrary. As might be expected, Dr. Holzmann's conclusions are clearly cut, and alternatives are rigidly excluded: the Crucifixion is dated on the 7th of April A.D. 30, and St Paul's arrest (with the older writers) at Pentecost A.D. 58.

(B. H. T.)

**Bible, English.** The history of the vernacular Bible of the English race resolves itself into two distinctly marked periods—the one being that of Manuscript Bibles, which were direct translations from the Latin Vulgate, the other that of Printed Bibles, which were, more or less completely, translations from the original Hebrew and Greek of the Old and New Testaments.

1. The Manuscript Bible.—The first essays in Biblical translation, or rather paraphrasing, assumed in English, as in many other languages, a period of the 9th century, according to the testimony of Bede (Hist. Eccl. iv. 24), Cadmon sang "de creatione mundi et origine humani generis, et tota Genesis historia, de egressu Israel ex Aegypto et ingresso in terram repromissionibus, de aliis pluribus sacris Scripturae historia, de incarnatione Dominica, passione, resurrectione et ascensione in coelum, de Spiritus Sancti adventu, et apostolorum doctrina." It is, however, doubtful whether any of the poetry which has been ascribed to him can claim to be regarded as his genuine work.

The first prose rendering of any part of the Bible—and with these we are mainly concerned in the present inquiry—originated in all probability in the 8th century, when Bede, the eminent scholar and churchman, translated the first portion (chs. i.-vi. 9) of the Gospel of St John into the vernacular, but no part of this rendering is extant. His pupil Cuthbert recorded this fact in a letter to a fellow-student; Cuthwine: "a capite sancti evangelli Johannis usque ad eum locum in quo dicitur, 'sed haec quid sunt inter testes?' in nostris linguis ad utilitatem ecclesiae Dei convertit." (Mayor and Lumby, *Bede's Hist. Eccl.* p. 178.)

The 9th century is characterized by interlinear glosses on the Book of Psalms, and towards its close by a few attempts at independent translation. Of these "glossed Psalters" twelve MSS. are known to exist, and they may be ranged into two groups according to the Latin text they represent. The Roman Psalm is glossed in the following MSS.: (1) Cotton Vesp. A. r (Vespasian Psalter); (2) Bodl. Junius 27; (3) Univ. Libr. Camb. Fr. I. 25; (4) Brit. Mus. Reg. 2. B. 5; (5) Trin. Coll. Camb. R. 17. 1 (Eadwine's Psalter); (6) Brit. Mus. Add. 37517. The Gallican Psalm is glossed in the following: (1) Brit. Mus. Stowe 2 (Spelman's text); (2) Cotton Vitell. E. 18; (3) Cotton Tib. C. 16; (4) Lambeth 48; (5) Arundel 60; (6) Salisbury Cath. 150.1

The oldest and most important of these MSS. is the so-called [Vespasian Psalter], which was written in Wrecceia in the first half of the 9th century. It was in all probability the original from which all the above-mentioned Old English glosses were derived, though introduced by successive scribes. The first verse of Psalm c. (Vulg. xxix. 2) may serve as a specimen of these glosses.

**Roman Text.**

M.S. Vespasian, A. 1.  
Wysnuma e godde, all cordc eowelad Dryhtne in blisse;  
inga in geside his in

infarra on ganste hyms  
on blisse.2

In *Jubilata Deo, omnis terra; servite Domino in laetitia; intrate in conspectu eius in exultatione.*

To the late 9th or early 10th century a work may be assigned which is in so far an advance upon preceding efforts as to be a real translation, not a mere gloss corresponding word for word with the Latin original. This is the famous *Paris Psalter*, a rendering of the first fifty Psalms (Vulg. l.-x. ro), contained in the unique MS. lat. 823 in the Bibliothèque Nationale, Paris. The authorship of this version is doubtful, being by some scholars attributed to King Alfred (d. 901), of whom William of Malmedbury writes (Gesta Regum Anglorum, ii. 129). 3 Psalterium transiere aggressus vix prima parte explicata vivendi finem (123). This view is, however, denied by others.

In the course of the 10th century the Gospels were glossed and translated. The earliest in date is a *Northumbrian Gloss on the Gospels*, contained in a beautiful and highly interesting MS. variously known as the *Durham Book*, the *Lindisfarne Gospels*, or the *Book of St Cuthbert* (MS. Cotton. Neron. D. 4). The Latin text dates from the close of the 7th century, and is the work of Eadfrith, bishop of Lindisfarne (698-721). The English gloss was added about a century and a half later (e. 950) by one Aldred, whom Dr Charles O'Connor (*Bibl. Stolensvis*, 1818-1819, i. 180) supposed to have been the bishop of Durham of that name. The Lord's Prayer is glossed in the following way:—

**Lindisfarne Gospels.**

Matthew vi. 9.  
Suæ sonne iugh gie bidde fader uer 8u æw  
sic ergo nos oratis;+Pater noster qui es  
8u bist in heofnum þ in heofnum; sie gehaldan noma  
scælæ; sanctificæte nomen tuum;  
co-ymædde sceal se  
sinu suae  
jæ in corde,  
in terra.  
læf useorne ofweristicel  
panem nostrum super-substatal[m] dæ nobis hodie.  
forjeg us sceylda usrau uocue for geofen scylgum  
dæ nobis debetae nostris sicut nos dimittimus debitoris  
usuris.  
ne inlæd uisih in costanghe ægr ðegir usiculo  
en inducados nos in temptationem sed liberæ nos a male.4

The Word’s Prayer is rendered in the following way in the West-Saxon Gospels:

West-Saxon Gospels.—MS Corpus 140.

Matthew vi. 9. Eorunlice gebedda eow $us; Fader ure $u $e cart on heofonum: si $ie ona gehalod (10) to-becume $ie rice; gewurc $ie ona willa on corran swa $a on heofonum. (11) $urne gedaghamlican hlaf syle us to deag, (12) $ forgyl $u $e gyltas swa swa wé forgylas $aum gyldentum. (13) $ ne $elaed pu us on costnungen ac alys us of yfel spolice.

Towards the close of the century the Old Testament found a translator in Ælfric (g.v.), the most eminent scholar in the close of the opening decades of the 11th century. Ælfric. According to his own statement in De vetere testamento, written about 1010, he had at that period translated the Pentateuch, Joshua, Judges, Kings, Job, Esther, Judith and the Maccabees. His rendering is clear and idiomatic, and though he frequently abridges, the omissions never obscure the meaning or hinder the easy flow of the narrative.

Dietrich, Ælfric’s most competent biographer (Niedner’s, Zeitschrift für historische Theologie, 1855-1856), looks upon the Pentateuch, Joshua and Judges as a continuation of his Lives of Saints, including as they do in a series of narratives the Old Testament saints. Genesis is but slightly abridged, but Job, Kings, Judges, Esther and Judith as well as the Maccabees are mere homilies epitomized from the corresponding Old Testament books. Judith is metrical in form.

The 11th century, with its political convulsions, resulting in the establishment of an alien rule and the partial suppression of the language of the conquered race, was unfavourable to literary efforts of any kind in the vernacular. With the exception of Ælfric’s late works at the very dawn of the century, we can only record two transcripts of the West-Saxon Gospels as coming at all within the scope of our inquiry.

In the 12th century the same gospels were again copied by pious hands into the Kentish dialect of the period.

The 13th century, from the point of view of Biblical renderings into the vernacular, is an absolute blank. French—or rather the Anglo-Norman dialect of the period—reigned supreme amongst the upper classes, in schools, in parliament, in the courts of law and in the palace of the king. English lurked in farms and hovels, amongst villeins and serfs, in the outlying country-districts, in the distant monasteries, amongst the lower clergy, amongst the humble and lowly and ignorant. There were certainly renderings of the Bible during the 12th, 13th and early 14th centuries, but they were all in French. Some of these translations were made, and some were brought over to England and copied and recopied. Amongst the latter was the magnificently illuminated Norman Commentary on the Apocalypse, some of the earliest copies of which were written in an English hand. In fact before the middle of the 14th century the entire Old Testament and the greater part of the New Testament had been translated into the Anglo-Norman dialect of the period. (MSS. Bibl. Nat. fr. 1, 9562, Brit. Mus. Reg. I. c. iii. Cf. S. Berger, La Bible française au moyen âge, Paris, 1884, pp. 78 ff.)

When English finally emerged victorious, towards the middle and latter half of the 14th century, it was for all practical purposes a new language, largely intermixed with French, differing from the language of the older period in sound, flexion and structure. It is evident that any Old English versions which might have survived the ravages of time would now be unintelligible, it was equally natural that as soon as French came to be looked upon as an alien tongue, the French versions hitherto known might be discarded, and that attempts should again be made to render the Bible into a language intelligible to the greater part of the nation—into English. It was also natural that these attempts should be made where the need was most pressing, where French had gained least footing, where parliament and court were remote, where intercourse with France was difficult. In fact in the Northern Midlands, and in the North even before the middle of the 14th century, the book of Psalms had been twice rendered into English, and before the end of the same century, probably before the great Wycliffite versions had spread over the country, the whole of the New Testament had been translated by different hands into one or other of the dialects of this part of the country.

At the same time we can record only a single rendering during the whole century which originated in the south of England, namely the text of James, Peter, 1 John and the Pauline Epistles (edited by A. C. Pau, Cambridge, 1904).

Of these pre-Wycliffite versions possibly the earliest is the West Midland Psalter, once erroneously ascribed to William of Shoreham. It occurs in three MSS., one of which, Brit. Mus. Add. 17376, was probably written between 1340 and 1350. It contains a complete book of the Psalms, followed by the usual eleven canticles and the Athanasian Creed. The Latin original is a glossed version of the Vulgate, and in the English translation the words of the gloss are often substituted for the strong and picturesque expressions of the Biblical text; in other respects the rendering is faithful and idiomatic. The following two verses of the first psalm may exemplify this:

(i.) Beatus vir, qui non oblit in consilio impiorum, et in uia peccatorum non stetit, et in caluera it iudicato pestilentem et falsitatem non sedet. Blessed be the man that selle in counsel of wicked, ne stote nouia in lea of sinjers, ne sat nouit in fals iugement.

(ii.) Sei in lege dominii voluntas eius, et in lege eius meditabitur die ac nocte. As his will was in lea of oure Lord, and he schal lenche in his lawe bole daye and niyte.

Before the middle of the century Richard Rolle (g.v.), the hermit of Hampole (+ 1349), turned into English, with certain additions and omissions, the famous Commentary on the Psalms by Peter Lombard. The work was undertaken, as the metrical prologue of one of the copies tells us (MS. Laud. misc. 286), "At a worthy reclus’ prayer, clad dame Merget Kykby." The Commentary gained immediate and lasting popularity, and spread in numerous copies throughout the country, the peculiarities of the hermit’s vigorous northern dialect being either modified or wholly removed in the more
BIBLE, ENGLISH

southerly transcripts. The translation, however, is stiff and literal to a fault, violating idiomatic usage and the proper order of words in its strict adherence to the Latin. The following brief extracts may exemplify the hermit's rendering and the change the text underwent in later copies.

MS. Univ. Coll. 64.

(i. t.) Blissful man &e whilke owai 3ed noight in &e couneil of wicked, and in &e way of synful stode noight, & in &e charie of pestilece he sought not. (2) Blesed is he of oure owighte: he wil of him: and in his lauge he sal thinke day & nyght.

Approximately to the same period as these early renderings of the Psalter belongs a version of the Apocalypse with a Commentary, the earliest MS. of which (Harleian 874) is written in the dialect of the North Midlands. This Commentary, for a long time attributed to Wycliffe, is really nothing but a verbal rendering of the popular and widely-spread Norman Commentary on the Apocalypse (Paul Meyer and L. Delisle, L'Apoocalypse en Francais au XIIIe siecle, Paris, 1901), which dates back as far as the first half of the 13th century, and in its general tenor reproduces the height of orthodoxy and the spirit of religious reform to judge from the number of MSS. remaining, must have enjoyed great and lasting popularity. Several revisions of the text exist, the later of which present such striking agreement with the later Wycliffite version that we shall not be far wrong if we assume that they were made use of to a considerable extent by the revisers of this version.

To the North Midlands or the North belongs further a complete version of the Pauline Epistles found in the unique MS. 32, Corpus Christi College, Cambridge, of the 15th century. Commentaries on the Gospels of St Matthew, St Mark and St Luke, we are told by the heading in one of the MSS. (Univ. Libr. Camb. Ii. 2. 12), were also translated into English by "a man of he north cuntre." The translation of these Gospels as well as of the Epistles referred to above is still and awkward, the translator being evidently afraid of any departure from the Latin text of his original. The accompanying commentary is based on the Fathers of the Church and entirely devoid of any original matter. The opening lines of the third chapter of Matthew are rendered in the following way:

MS. Camb. Univ. Libr. Ii. 2. 12.

(ii. t.) In hoo dayes com hote feasten prechyn in desert of he lvery, & Seyand. (3) Do the men schewen forwhy he kynypared of heuyne sal com negh. (3) Phis is he of whom he seide be Iseye prephete, sayand. [e voice of he cryand in he desert, redye he voice of Good, right made he liryl wayes of him." (4) & Hone he kleying of he hoeris of camels, & a gryyl of a skyjn about his leynys; & his mete was he lousyt & hony of he wode.

A version of the Acts and the Catholic Epistles completes the number of the New Testament books translated in the northern parts of England. It is found in several MSS., either separately, or in conjunction with a fragmentary Southern Version of the Pauline Epistles, Peter, James and I John in a curiously compiled volume, evidently made, as the prologue tells us, by a brother superior for the use and edification of an ignorant "sister," or woman vowed to religion. The translation of this, our only southern text, surpasses all previous efforts from the point of view of clearness of expression and idiomatic use of English, and, though less exact, it may be even said in these respects to rank equal with the later or revised Wycliffite version.

Apart from these more or less complete versions of separate books of the Bible, there existed also numerous renderings of the Lord's Prayer, the Ten Commandments, accounts of the Life, Passion and Resurrection of our Lord, translations of the epistles and gospels used in divine service, and other means of familiarizing the people with Holy Scripture. It was the custom of the medieval preachers and writers to give their own English version of any text which they quoted, not resorting as in later times to a commonly received translation. This explains the fact that in collections of medieval homilies that have come down to us, no two renderings of the Biblical text used are ever alike, not even Wycliffe himself making use of the text of the commonly accepted versions that went under his name.

It is noteworthy that these early versions from Anglo-Saxon times onwards were perfectly orthodox, executed by and for good and faithful sons of the church, and, generally speaking, with the object of assisting those whose knowledge of Latin proved too scanty for a proper interpretation and understanding of the holy text. Thus Richard Rolle's version of the Psalms was executed for a nun; so was in all likelihood the southern version of the epistles referred to above. Again the earliest MS. (Harl. 874) of the Commentary on the Apocalypse gives the owner's name in a coeval hand as "Richard Schepard, presbiter," and the Catholic Epistles of MS. Douce 250 were probably glossed for the benefit of men in religious orders, if one may judge from a short Commentary to James ii. 2, "& Perso if any man come into youre sijn, fait it, into your campenye hau help Cedes religiouse made, and he shal ther fore be. Nor do any of the remaining works contain anything but what is strictly orthodox.

It is first with the appearance of Wycliffe (q.v.) and his followers on the arena of religious controversy that the Bible in English came to be looked upon with suspicion by the orthodox party within the Church. For it is a well-known fact that Wycliffe proclaimed the Bible, not the Church or Catholic tradition, as a man's supreme spiritual authority, and that he sought in consequence by every means in his power to spread the knowledge of it among the people. It is, therefore, in all likelihood to the zeal of Wycliffe and his followers that we owe the two noble 14th-century translations of the Bible which tradition has always associated with his name, and which are the earliest complete renderings that we possess of the Holy Scriptures into English.

The Wycliffite Versions.

The first of these, the so-called Early Version, was probably completed about 1382, at all events before 1384, the year of Wycliffe's death. The second, or Later Version, being a thorough revision of the first, is ascribed to the year 1388 by Sir Frederic Madden and the Rev. Joshua Forshall in their edition of these two versions.

It is a matter of uncertainty what part, if any, Wycliffe himself took in the work. The editors of the Wycliffite versions say in the Preface, pp. xxv. ff. — "The New Testament was naturally the first object. The text of the Gospels was extracted from the Commentary upon them by Wycliffe, and to these were added the Epistles, the Acts and the Apocalypse, all now translated anew. This translation might probably be the work of Wycliffe himself; at least the similarity of style between the Gospels and the other parts favours the supposition." The Wycliffite authorship of the Commentaries on the Gospels, on which the learned editors base their argument, is, however, unsupported by any evidence beyond the fact that the writer of the Prologue to Matthew urges in strong language "the propriety of translating Scripture for the use of the laity." The Biblical text found in these Commentaries is in fact so far removed from the original type of the Early Version as to be transitional to the Late, and, what is still more convincing, passages from the Early Version, from both the Old Testament and the New Testament, are actually quoted in the Commentary. Under such circumstances it would be folly to look upon them as anything but late productions, at all events later than the Early Version, and equal folly to assign these bulky volumes to the last two years of Wycliffe's

3 For a different view as to the authorship of the Wycliffite versions, see F. A. Gasquet, The Old English Bible and Other Essays (London, 1897), pp. 102 ff.

The Old Testament of the Early Version was, according to the editors (Preface, p. xvii.), taken in hand by one of Wycliffe's coditores, Nicholas de Herford. The translator's original copy and a coeval transcript of it are still extant in the Bodleian library (Bodl. 1595, Douce 360). Both break off abruptly at Baruch iii. 19, the latter having at this place a note inserted to the following effect: *Explicit transcription Nicholas de herford.* There is consequently but little doubt that Nicholas de Herford took part in the translation of the Old Testament, though it is uncertain to what extent. The translator's copy is written in less than five hands, differing in orthography and dialect. The note may therefore be taken to refer either to the portion translated by the last or fifth hand, or to the whole of the Old Testament up to Baruch iii. 19. Judging from uniformity of style and mode of translation the editors of the Bible are inclined to take the latter view; they add that the remaining part of the Old Testament was completed by a different hand, the one which also translated the New Testament. This statement is, however, not supported by sufficient evidence. In view of the magnitude of the undertaking it is on the contrary highly probable that other translators besides Wycliffe and Nicholas de Herford took part in the work, and that already existing versions, with changes when necessary, were incorporated or made use of by the translators. The Early Version, apart from its completeness, shows but little advance upon preceding efforts. It is true that the translation is more careful and correct than some of the renderings noticed above, but on the other hand it shares all their faults. The translation of the Old Testament as far as Baruch iii. 19 is stiff and awkward, sometimes unintelligible, even nonsensical, from the close adherence to the Latin text (e.g. Judges xx. 23). In the remaining parts the translation is somewhat easier and more skilful, though even here Latinisms and un-English renderings abound.

It is small wonder, therefore, if a revision was soon found necessary and actually taken in hand within a few years of the completion of the Earlier Version. The principles of work adopted by the revisers are laid down in the general prologue to their edition, the so-called "Later Version."

For these reasons and others... a sumply creature hath translatid the bible out of Latyn into English. First, this sumply creature hadde myche travaile, with dures felawys and helperis, to gedere manie elde biblis, and othere doctures, and commune glothes, and to make a latyn by sumply sumdul trewe; and thanne to studie it of the neue, the text with the glose, and othere doctures, as he mitte gete, and speciali Lere on the elde testament, that helpide ful myche in this werk; the thridle tyne to conselle with elde grammaries, and elde dyvynys, of hondres, and seruys, of the Latyn and of the English; and to haue ane manie gode felawys and kunnyng at the corretting of the translacioun.

It is uncertain who the revisers were; John Purvey, the leader of the Lollard party after Wycliffe's death, is generally assumed to have taken a prominent part in the work, but the evidence of this is extremely slight (cf. Wyclif, Bible, Preface, pp. xxv. f.). The exact date of the revision is also doubtful: the editors of Wyclif's Bible, judging from the internal evidence of the Prophets to which it has been finished about 1388, Revised or Later Version is in every way a readable, correct rendering of the Scriptures, it is far more idiomatic than the Earlier, having been freed from the greater number of its Latinisms; its vocabulary is less archaic. Its popularity admits of no doubt, for even now in spite of neglect and persecution, in spite of the ravages of fire and time, over 150 copies remain to testify to this fact. The following specimens of the Early and Later Versions will afford a comparison with preceding renderings:

life merely because the text used in them happens to be that of the Early Version. It is therefore at present impossible to say what part of the Early Version of the New Testament was translated by Wycliffe.

Forsothe the days came Ioon Baptyst, pre-chynge in the desert of Jude, saying, (2) Do ye pence, for the kinghoom of heuens sylente, or come nise. (3) Forsothe this is he of whom it is sayd by Ysaye the prophet, A voice of a crie in the wastes of the ways of the Lord; make me riustfull the pathes of hym. (4) Forsothe that Iik Ioon hadde cloth of flax, and girdel of slynne aboute his leedis; sothely his mete weren locustis, and hony of the wode.

The 15th century may well be described as the via dolorosa of the English Bible as well as of its chief advocates and supporters, the Lollards. After the death of Wycliffe violence and anarchy set in, and the Lollards came gradually to be looked upon as enemies of order and disturbers of society. Stern measures of suppression were directed not only against them but against "Goddis Lawe," the book for which they pleaded with such passion. For example, the bishops' registers bear sufficient testimony to this fact. It would appear, however, as if at first at all events the persecution was directed not so much against the Biblical text itself as against the Lollard interpretations which accompanied it. In a convocation held at Oxford under Archbishop Arundel in 1408 it was enacted "that no man hereafter by his own authority translate any text of the Scripture into English or any other tongue, by way of a book, booklet, or tract; and that no man read any such book, booklet, or tract, now lately composed in the time of John Wyclif or since, or hereafter to be set forth in part or in whole, publicly or privately, upon pain of greater excommunication, until the said translation be approved by the ordinary of the place, or, if the case so require, by the council provincial. He that shall do contrary to this shall likewise be punished as a favourer of heresy and error."

It must be allowed that an enactment of this kind was not without justification. The Lollards, for instance, did not hesitate to introduce into certain copies of the pious and orthodox Commentary on the Psalms by the hermit of Hampole interpola-tions of their own of the most virulently controversial kind (MSS. Trin. Coll. Camb. B.V. 25, Brit. Mus, Reg. i. C. 26, &c.), and although the text of their Biblical versions was faithful and true, the General Prologue of the Later Version was interlarded with controversial matter. It is small wonder if the prelates and priests sought to repress such trenchant criticism of their lives and doctrines as appeared more especially in the former work, and probably in many others which since have perished in "flagots and burning."

For all this, manuscripts of Purvey's Revision were copied and re-copied during this century, the text itself being evidently approved by the ecclesiastical authorities, when in the hands of the right people and if unaccompanied by controversial matter.

Of the Lollard movement in Scotland but little is known, but a curious relic has come down to our times in the shape of a New Testament of Purvey's Revision in the Scottish dialect of the early 16th century. The transcriber was in all probability a certain Murdoch Nisbet, who also showed his reforming tendencies by adding to it a rendering of Luther's Prologue to the New Testament.
2. The Printed Bible.—It is singular that while France, Spain, Italy, Bohemia, and Holland possessed the Bible in the vernacular before the accession of Henry VIII., and in Germany the Scriptures were printed in 1466 and seventeen times reprinted before Luther began his great work, yet no English printer attempted to put the familiar English Bible into type. No part of the English Bible was printed before 1524, no complete Bible before 1535, and none in England before 1538.

Versions of the Scriptures so far noticed were all secondary renderings of the Vulgate, translations of a translation. It was only with the advent of the “new learning” in England that a direct rendering from the originals became possible. Erasmus in 1516 published the New Testament in Greek, with a new Latin version of his own; the Hebrew text of the Old Testament had been published as early as 1478.

The first to take advantage of these altered conditions was William Tyndale (q.v.), “to whom,” as Dr Westcott says, “it has been allowed more than to any other man to give its characteristic shape to the English Bible.” Of Tyndale’s early life but little is known. Be it enough for our purpose to say that he thoroughly saturated his mind with the “new learning” first at Oxford, where in 1523 he was admitted to the degree of M.A., and then in Cambridge, where the fame of Erasmus had already preceded him. In 1525 we find Tyndale as chaplain and tutor in the family of Sir John Walsh of Old Sodbury in Gloucestershire. He was there constantly involved in theological controversies with the surrounding clergy, and it was owing to their hostility that he had to leave Gloucestershire. He then resolved to open their eyes to the serious corruptions and decline of the church by translating the New Testament into the vernacular. In order to carry out this purpose he repaired in July or August 1523 to London, and to the famous protector of scholars and scholarship, Bishop Cuthbert Tunstall. His reception was, however, cold, the bishop advising him to seek a livelihood in the town. During a year of anxious waiting, it became clear to him “not only that there was no room in my lorde of London palace to translate the new testament, but also that there was no place to do it in all england.” In May 1524 he consequently betook himself to Hungary, his resolution to carry out his great work never for a moment flagging, and it was probably during his stay in this free city and in Wittenberg, where he may have been stimulated by Luther, that his translation of the New Testament was actually begun. At all events, the beginning of July, 1525, we have Tyndale in Cologne, engaged in printing at the press of Peter Quentel a quarto edition of the New Testament. This edition was provided with prefaces and marginal glosses. He had advanced as far as the tenth sheet, bearing the signature K, when his work was discovered by Johann Cochlaeus (q.v.), a famous controversialist and implacable enemy of the Reformation, who not only caused the Senate of Cologne to prohibit the continuation of the printing, but also communicated with Henry VIII. and Wolsey, warning them to stop the importation of the work at the English seaports. Tyndale and his assistant, William Roye, managed, however, to escape higher up the Rhine to Worms, and they succeeded in carrying with them some or all of the sheets which had been printed. Instead of completing Quentel’s work, Peter Schoeffel, the Worms printer, was employed to print another impression of 3000 in a small octavo size, without prefaces to the books or annotations in the margin, and only having an address “To the Reader” at the end in addition to the New Testament itself. Two impressions, the quarto having possibly been completed by Schoeffel, arrived in England early in the summer of 1526, and gained eagerly welcomed and great advantages. Such strong measures of suppression were, however, at once adopted against these perilous volumes, that of the quarto only a single fragment remains (Matt. i.–xxii. 12), now preserved in the British Museum (Grenville, 12179), of the octavo only one perfect copy (the title-page missing) in the Baptist College at Bristol,4 and one imperfect in the library of St Paul’s cathedral.

But Tyndale continued his labours undaunted. In 1529 the manuscript translation of Deuteronomy is mentioned as having perished with his other books and papers in a shipwreck which he suffered on the coast of Holland, on his way to Hamburg. In 1530, however, the whole of the Pentateuch was printed in Marburg by Hans Lufft; it is provided with prefaces and marginal annotations of a strongly controversial character. The only perfect copy is preserved in the Grenville library of the British Museum.5 It was reissued in 1534 with a new preface and certain corrections and emendations in Genesis, and again in London in 1551.

In 1531 the Book of Jonah appeared with an important and highly interesting prologue, the only copy known of which is in the British Museum.6 Meanwhile the demand for New Testaments, for reading or for the flames, steadily increased, and the printers found it to their advantage to issue the Worms edition of the New Testament in not less than three surreptitious reprints before 1534. This is testified by George Joye in his Apology, who himself brought out a fourth edition of Tyndale’s New Testament in August 1534. Inasmuch many of the errors which, through the carelessness of the Flemish printers, had crept into the text but with such alterations and new renderings as to arouse the indignation of Tyndale. The only remaining copy, a 16mo, is in the Grenville library. To counteract and supersede all these unauthorized editions, Tyndale himself brought out his own revision of the New Testament with translations added of all the Epistles of the Old Testament after the use of Salisbury. It was published in November 1534 at Antwerp by Martin Emporer. Prolegomena were added to all books except the Acts and the Apocalypse, and new marginal glosses were introduced. Three copies of this edition are in the British Museum, and it was reprinted in 1841 in Bagster’s Hexapla. In the following year Tyndale once more set forth a revised edition, “ynished in the yeare of our Lorde God A.M.D. and XXXV.”, and printed at Antwerp by Godfried van der Haghen.7 In these headings were added to the chapters in the Gospels and the Acts, and the marginal notes of the edition of 1534 were omitted. It is chiefly noted for the peculiarities of its orthography. Of this edition only one copy is in the University library, Cambridge, a second copy is in Oxford, and a fragment in the British Museum. It is supposed to have been revised by Tyndale while in prison in the castle of Vilvorde, being the last of his labours in connexion with the English Bible. His execution took place on the 6th of October 1536, and about the same time a small folio reprint of his revised edition of 1534 was brought out in England, the first volume of Scripture printed in this country, probably by T. Berthelet.8 A perfect copy is found in the Bodleian library. In later years, between 1536 and 1550, numerous editions of Tyndale’s New Testament were printed, twenty-one of which have been enumerated and fully described by Francis Fry.9

The history of our English Bible begins with the work of Tyndale and not with that of Wycliffe,” says Dr Westcott in his History of the English Bible, p. 316, and it is true that one of the most striking features of the work of Tyndale is its independence. Attempts have been made to show that especially in the Old Testament he based a great deal of his work on the Wycliffite translations, but in face of this we have our own explicit

4 Reprinted by G. Offor (London, 1836); reproduced in facsimile by Francis Fry (Bristol, 1862).
6 Reproduced in facsimile by Francis Fry (1865).
7 Cf. H. Bradhaw, Bibliographer (1882–1881), i. 3 ff. (reprinted 1886).
statement, “I had no man to counterfeit, neither was holpe with englisyafe of ony that had interpreted the same (i.e. the New Testament), or soehe lyke thighe I the scripture beforeyme.”

He translated straight from the Hebrew and Greek originals, although the Vulgate and more especially Erasmus's Latin version were on occasion consulted. For his prefaces and marginal notes he used Luther's Bible freely, even to paraphrasing or verbally translating long passages from it.

Apart from certain blemishes and awkward and even incorrect renderings, Tyndale's translation may be described as a truly noble work, faithful and scholarly, though couched in simple and popular language. Surely no higher praise can be accorded to it than that it should have been taken as a basis by the translators of the Authorized Version, and thus have lived on through the centuries up to the present day.

The following specimens may prove of interest:

The thirde Chapter.

(Matthew iii. 1-4) In those days Iohn the baptyster cam and preached in the wyldernes of Iury, saynge, Repent, the kyngedome of heaven is at hand. Thys ye hys of whom it ys spoken the prophet Isayye, sayth: the voice of a cryer in wyldernes, prepare ye the lords waye, and make hys pathes straught. Thys Iohn had hys garment of camelles heere, and a gyrdyll of a skynnye about hys lonyes. Hys meate was locustes & wyldhe onye.

* * *

Locustes are more then owernes: souche men vse to eate in divers partes of the e" (marginal note).

(Matthew vi. 9-13.) Our father which art in heaven, halewed be thee name. Let thy kingdom come. Thy wyll be fulfyled, as in earth, as in heaven. General the signe of the queene of heaven, free of all trawe of sseate, And forgve vs our owre trespasses, even as we forgve them whych trespass vs. Lede vs nott in to temptacion, but delaue vs from yven. (Grenville 12179.)

Meanwhile a complete English Bible was being prepared by Miles Coverdale (q.v.), an Augustinian friar who was afterwards for a few years (1531-1535) bishop of Exeter. As the printing was finished on the 4th of October 1535 it is evident that Coverdale must have been engaged on the preparation of the work for the press at almost as early a date as Tyndale. Foxe states (op. cit. v. 120) that Coverdale was with Tyndale at Hamburg in 1530, and it is probable that most of his time before 1535 was spent abroad, and that his translation, like that of Tyndale, was done out of England.

In 1584, Henry Stevens, in his catalogue of the Caxton Exhibition, printed out a statement by a certain Simeon Ruytincx in his life of Emanuel van Meteren, appended to the latter's Neder- landische Historie (1614), that Jacob van Meteren, the father of Emanuel, had manifested great zeal in producing at Antwerp a translation of the Bible into English, and that employed for that purpose a certain learned scholar named Miles Coverdale (sic). In 1884 further evidence was adduced by W. J. C. Moens, who reprinted an affidavit signed by Emanuel van Meteren, 28 May 1609, to the effect that "he was brought to England anno 1550 . . . by his father, a furtherer of reformed religion, and that caused the first Bible at his costes to be Englished by Mr Myles Coverdal in Andwrarp, the w'h his father, with Mr Edward Whychurch, printed both in Paris and London" (Registers of the Dutch Reformed Church, Austin Friars, 1884, p. xiv.). From the statement to Whychurch and the place of printing, this statement agrees with that of Simeon Ruytincx, and it is possible that van Meteren showed his zeal in the matter by undertaking the cost of printing the work as well as that of remunerating the translator. Mr W. A. Wright, however, judging from what are "the name of Whychurch", which was introduced, that the places of printing were given as London and Paris, not Antwerp, and lastly that Emanuel van Meteren being born in 1535 could only have derived his knowledge from hearsay, is inclined to think that the Bible in which J. van Meteren was interested "was Matthew's of 1537 or the Great Bible of 1539, and not Coverdale's of 1535." 12

It is highly probable that the printer of Coverdale's Bible was Christopher Froshouer of Zürich, 3 who printed the edition of 1539, and that the sheets were sent for binding and distribution to James Nicolson, the Southwark printer. This first of all printed English Bibles is a small folio in German black letter, bearing the title: "Biblia, The Bible; that is, the Holy Scripture of the Old and New Testament, faithfully and truly translated out of Douche (German) and Latyn into Englishse, M.D.XXXXV." The volume is provided with woodcuts and initials, the title-page and preliminary matter in the only two remaining copies (British Museum and Holkam Hall) being in the same type as the body of the book. A second issue of the same date, 1535, has the title-page and the preliminary matter in English type, and omits the words "out of Douche and Latyn"; a third issue bears the date 1536. A second edition in folio, "newly oversene and corrected," was printed by Nicolson, with English type, in 1537; and also in the same year, a third edition in quarto. On the title-page of the latter were added the significant words, "set forth with the Kynges moste gracious licence."

Coverdale, however, was no independent translator. Indeed, he declares any such claim by stating expressly, in his dedication to King Henry VIII, "with a cleare conscience purely & faythfully translated this our English Bible for the use of synners, having onely the manyst true and of the scripture before wyne eyes," and in the Prologue he refers to his indebtedness to "The Douche (German) interpreters: whom (because of thyngyll gyfetes and speciall diligence in The Bible) I haue ben the more glad to folowe for the most parte, accordinke as I was reqyred."

These "fuye interpreters" Dr Westcott (ibid. p. 163) identifies as Luther, the Zürich Bible, the Latin version of Pagninus, the Vulgate, and, in all likelihood, the English translation of Tyndale.

Though not endowed with the strength and originality of mind that characterized Tyndale's work, Coverdale showed great discrimination in the handling and use of his authorities, and moreover a certain delicacy and happy ease in his rendering of the Biblical text, to which we owe not a few of the beautiful expressions of our present Bible.

The following extracts from the edition of 1535 may serve as examples of his rendering:

The first psalm.

(i. 1-3.) Blessed is Jhew man, goeth not in to the counsell of the un-godly; he abydeth not in the waye of synners, & synners not in Jhew seate of the sconefull. But delyteyth in the lawe of Jhew, & exerçyseth himself in his lawe both daye and night.

The gospel of S. Mathew.

(iii. 1-4.) In those days Iohn the Baptister came and preached in the wildernese of Iury, sayng: Amendye your selues, the kyngdome of heaven is at hand. This is he, of whom it is spoken by the prophet Esay, which sayeth: The voyce of a cryer in fe wyldernes, prepare the Lords waye, and make his pathes straught. This Iohn had his garment of camelles heere, and a lethern gerdell aboute his lonyes. Hys meate was locustes and wyldhe hony.

It should be added that Coverdale's Bible was the first in which the non-canonical books were left out of the body of the Old Testament and placed by themselves at the end of it under the title Apocrypha.

The large sale of the New Testaments of Tyndale, and the success of Coverdale's Bible, showed the London booksellers that a new and profitable branch of business was opened out to them, and they soon began to avail themselves of its advantages. Richard Grafton and Edward Whitchurch were the first in the field, bringing out a fine and full-sized folio in 1537, "truly and properly translated into English by Thomas Matthew." Thomas Matthew, is, however, in all probability, an alias for John Rogers, a friend and fellow-worker of Tyndale, and the volume is in reality no new translation at all, but a compilation from the renderings of Tyndale and Coverdale. Thus the Pentateuch and the New Testament were reprinted from Tyndale's translations of 1520 and 1535 respectively, with very slight variations; 13

See Dr Ginsburg's information to Mr Tedder, D.N.B. xii. 365.

Remains, Parker Soc., pp. 11 f.

2 Westcott, op. cit. p. 57 note.
BIBLE, ENGLISH

the books from Joshua to the end of Chronicles are traditionally, and lately also by external evidence, 1 assigned to Tyndale and were probably left by him in the hands of Rogers. From Ezra to Malachi the translation is taken from Coverdale, as is also that of the Apocryphal books. John Roger's own work appears in a marginal commentary distributed through the Old and New Testaments and chiefly taken from Olivetan's French Bible of 1555. The volume was printed in black letter in double columns, and three copies are preserved in the British Museum. In 1538 a second edition in folio appeared; it was reprinted twice in 1549, and again in 1551. It is significant that this Bible, like Coverdale's second edition, was "set forth with the kinges most gracious lycence," probably with the concurrence of Cranmer; since, in a letter to Cromwell, he begged him to "exhibit the book unto the king's highnesse, and to obtain of his grace . . . a licence that the same may be sold and read of every person, without danger of any act, proclamation or ordinance, heretofore granted to the contrary." 2 And thus it came to pass, as Dr Westcott strikingly puts it, that "by Cranmer's permission, by Cromwell's influence, and by Henry's authority, without any formal ecclesiastical decision, the book was given to the English people, which is the foundation of the text of our present Bible. From Matthew's Bible—itself a combination of the labours of Tyndale and Coverdale—all later revisions have been successively formed" (op. cit. p. 71).

Meanwhile the successful sale of Matthew's Bible, the private venture of the two printers Grafton and Whitchurch, was threatened by a rival edition published in 1559 in folio and quarto by "John Byddell for Thomas Barthlet" with Richard Taverner as editor. This was, in fact, what would now be called "piracy," being Grafton's Matthew Bible revised by Taverner, a learned member of the Inner Temple and famous Greek scholar. He made many alterations in the Matthew Bible, characterized by critical acumen and a happy choice of strong and idiomatic expressions. He is, perhaps, the first purist among the Biblical translators, endeavouring, whenever possible, to substitute a word of native origin for the foreign expression of his predecessors. 3 His revision seems, however, to have had little or no influence on subsequent translators, and was only once, in 1540, reprinted in its entirety. Quarto and octavo editions of the New Testament alone were published in the same year, 1539, as the original edition, and in the following year, 1540, the New Testament in duodecimo. The Old Testament was reprinted as part of a Bible in 1551, but no other editions are known than those named.

It will have been observed that the translations of Holy Scripture which had been printed during these years (1525-1539) were all made by private men and printed without any public authority. Some of them had indeed been set forth by the king's licence, but the object of this is shown by the above-quoted letter of Archbishops Cranmer to Cromwell, touching Matthew's Bible. It is "that the same may be sold and read of every person . . . until such time that we, the bishops, shall set forth a better translation, which I think will not be till a very long day." This letter was written on the 4th of August 1537, and the impatient words at the end refer to an authorized version which had been projected several years before, and which was, in fact, at that very time in preparation, though not proceeding quickly enough to satisfy Cranmer. In the year 1530, Henry VIII. had issued a commission of inquiry respecting the expediency and necessity of having "in the English tongue both the New Testament and the Old" (Wilkins' Concilia, iii. 737). This commission reported against the expediency of setting forth a vernacular translation until there was a more settled state of religious opinion, but states that the king "intended to provide that the Holy Scripture shall be, by great, learned and Catholic persons, translated into the English tongue if it shall then seem to His Grace convenient to be" (ib. 740). The Convocation of Canterbury refreshed the royal memory on the subject by petitioning the king on the 19th of December 1534 "that His Majesty would vouchsafe to agree, that the Scriptures should be translated into the vulgar tongue . . . delivered to the people according to their learning" (ibid. 770). The subject was again before Convocation in 1535, 4 but the detailed history is lost to us—all that is known being that Cromwell had placed Coverdale at the head of the enterprise, and that the result was an entirely new revision, based on Matthew's Bible. 5 Coverdale consulted in his revision the Latin version of the Old Testament with the Hebrew text by Sebastian Munster, the Vulgate and Erasmus's editions of the Greek text for the New Testament.

Concerning the printing of this authorized Bible more details are known. Cromwell had planned the work on a large scale, too large evidently for the resources of the English press, for it was determined that the printing should be entrusted to Francis Regnault, a famous Paris printer. At the request of Henry VIII., a licence was granted to Regnault for this purpose by Francis I., while Coverdale and Grafton were sent over in 1538 to superintend the work as it passed through the press. The work was pressed forward with all speed, for, as Coverdale to Cromwell, "they were" daily threatened "and ever feared "to be spoken withal." 6 And indeed the first edition was interdicted by the Inquisitor-general for France, and orders were given to seize the whole of the impression. Coverdale and Grafton left Paris quickly, but soon returned, rescued a great number of the finished sheets, "four great vats" full of them having been sold to a haberdasher instead of being burnt—and conveyed types, printing-presses and workmen to England. Thus the volume which had been begun in Paris in 1538 was completed in London, the colophon stating that it was "Fynished in Apryll, Anno MCCCCCXXXIX." It is a splendid folio Bible of the largest volume, and was distinguished from its predecessors by the name of The Great Bible. The title-page represents Henry VIII. giving the "Word of God" to Cromwell and Cranmer, who, in their order, distribute it to laymen and clerica, and describes the volume as "truly translated from the verye of the Hebrew and Greke textes by pe dylygent studeye of diverse excellent learned men, expert in the for-sayde tongues. Prented by Rychard Grafton and Edward Whitchurch." "Certain godly annotations," which Coverdale promised in the Prologue, did not, however, appear in the first issue, nor in any of the following. This was the first of seven editions of this noble Bible which issued from the press during the years 1539-1541,—the second of them, that of 1540, called Cranmer's Bible from the fact that it contained a long Preface by Archbishop Cranmer, having the important addition "This is the Byble appoynted to the use of the churches" on the title-page. Seventy years afterwards it assumed the form ever since known as the Authorized Version, but its Psalter is still embedded, without any alteration, in the Book of Common Prayer.

For the sake of comparison the following extracts from St Matthew are given, according to the edition of 1539.

(Matthew iii. 14.) In those days came John the Baptist, preaching in the wilderness of Judæa, saying, Repent ye for the kingdom of heaven is at hand. For the kingdom of heaven is at hand. For thus is he, of whom the prophet Esai spake, which sayeth, the voice of a cryer in the wilderness, prepare ye the way of the lorde: make his paths straight. Thus John had hys garment of camels hear and a girdle of a skin about his loins. Then he had a wild beast meat (Matthew vi. 9-14.) Oure father which art in heaven, halowed be thy name. Let thy kingdome come. Thyl shall be fulfilled, as well in ert, as it is in heuen. Geve vs this day our daly brede. And for vs the deth of our eyne and our soule, and our body the deadly. For thynne is the kyngdome and the power, and the glorie for ever. Amen.

Meanwhile the closing years of Henry VIII.'s reign were characterized by restrictive measures as to the reading and use of the Bible. Tyndale Version was prohibited by an act of

parliament, 1543; at that time it was enacted that all notes and marginal commentaries in other copies should be obliterated, and that " no woman (unless she be a noble or gentle woman), no artificer, nor any journeyman serving under the degree of yeomen . . . husbandmen or labourers " should read or use any part of the Bible under pain of fines and imprisonment. 1

In 1546 Coverdale's Bible was included in the proscription, the Great Bible being the only translation not interdicted. During Edward VI.'s reign there was a brief respite, but with the accession of Mary the persecutions of the English Bible and its friends were renewed. Cranmer suffered martyrdom at the stake, as John Rogers had done before him. Other prominent reformers, amongst whom Coverdale, sought refuge in Geneva, the town of Calvin and Beza, where they employed their enforced leisure in planning and carrying out a new revision of the Bible. The first fruited of these labours was a New Testament issued in June 1557, with an introduction by Calvin, probably the work of William Whittingham. 2 The volume, in a convenient quarto size, printed in clear Roman type, and with marginal annotations, gained immediate popularity in England, where a Bible suited for household use had long been needed. It was the first Bible which had the text divided into " verses and sections according to the best editions in other languages. 3 Whittingham's enterprise was, however, soon superseded by an issue of the whole Bible, which appeared in 1560, the so-called Genevan Bible, popularly also known as the Breeches Bible, from its rendering of Gen. iii. 7, " They sewed fig leaves together and made themselves breeches."

This edition was mainly due to the combined efforts of William Whittingham, Anthony Gilby and Thomas Sampson, and the expenses towards printing and publication were borne by members of the congregation at Geneva. It represented in the Old Testament a thorough and independent revision of the text of the Great Bible with the help of the Hebrew original, the Latin versions of Leo Judi (1543), Pagninus (1528), Sebastian Münster (1534-1535), and the French versions of Olyetan. The New Testament consisted of Tyndale's latest text revised to a great extent in accordance with Beza's translation and commentary. The changes introduced by the Genevan translators were, as a rule, a great improvement, and the version received a ready welcome and immediate popularity, not only on account of its intrinsic merits, but because of its handy size, usually that of a small quarto, and of its being printed, like Whittingham's New Testament, in a readable Roman type instead of black letter. Like this earlier publication, it had the division of the chapters into verses, and a marginal commentary which proved a great attraction to the Puritans. The popularity of the Genevan Bible was so great that between 1560 and 1644 at least 140 editions of it were published, 4 and this in spite of its not being allowed for use in the churches.

In 1576 the New Testament of the Genevan Bible was again revised by Lawrence Tomson and provided with a new commentary mainly translated from Beza. It soon became popular and even replaced the Genevan New Testament in later editions of the Bibles.

Some time after the accession of Queen Elizabeth an attempt was made to improve the authorized Great Bible, and in this way to challenge the ever growing popularity of the Calvinistic Genevan Bible. The initiative was taken by Archbishop Parker, about 1563-1565, who, according to Strype (Parker i. 414) " took upon him the labour to contrive and set the whole work a going . . . by sorting out the whole Bible into parcels . . . and distributing these parcels to able bishops and other learned men, to peruse and collate each the book or books allotted them . . . and they to add some short marginal notes for the illustration or correction of the text."

The rules upon which they proceeded were these:—

1. To follow the common English translation used in the churches, and not to recede from it, but where it varieth manifestly from the Hebrew or Greek original. 2. To use sections and divisions in the text as Pagninus in his translation useth, and for the variety of the Hebrew to follow the said Pagninus and Münster specially, and generally others learned in the tongues. 3. To make no bitter notes upon any text, or yet to set down any determination in places of controversy. 4. To note such chapters and places as contain points of great importance, and to italicize such places not edifying, with some strike or note, that the reader may eschew them in his public reading. 5. That all such words as sound in the old translation to any offence of lightness or obscurity be expressed with more convenient terms and phrases.

The work was pushed forward with energy, and on the 5th of October 1568 the volume was ready for publication. It was a magnificent folio, generally known as the Bishops' Bible, since not less than eight of these dignitaries took part in the revision. But the details and procedural way in which the revision had been carried out naturally caused certain inequalities in the execution of the work. The different parts of the Bible vary considerably in merit, the alterations in the New Testament, for instance, showing freshness and vigour, whereas most of the changes introduced in the Old Testament have been condemned as " arbitrary and at variance with the exact sense of the Hebrew text." (Westcott, op. cit. p. 237). Several editions of the Bishops' Bible were afterwards published, but it is doubtful whether the ecclesiastical authorities in spite of repeated enactments (Cardwell, Synodalia, pp. 115, 123, 210, 202) ever succeeded in entirely enforcing its public use in the churches. After 1569 the Great Bible ceased, however, to be reprinted. But in the homes the Genevan version still maintained its supremacy. One thing is certain, that the book of Psalms of the new revision had fairly soon to give way before the well-known and smooth rendering of the Great Bible. In the second edition of the Bishop's Bible, 1572, the two texts were actually printed side by side; in all later editions except one (1585) the older Psalter alone remained.

From the time of Tyndale onwards the translation of the Scriptures into English had been more or less an outcome of the great reformatory movements within the church. It was not until Queen Elizabeth's reign that members of the Romanist party found it expedient to translate the Bible into the vernacular " for the more speedy abolish- ing of a number of false and impious translations put forth by sundry sects, and for the better preservation or reclamation of many good soules endangered thereby " (Preface to the Rhemish Version).

According to the title-page the New Testament was " translated faithfully into English out of the authentical Latin, according to the best corrected copies of the same, diligently conferred with the Greeke and other editions in divers languages. . . . In the English College of Rome translated . . . and long since completed, but " for lack of good means " (Preface to the New Testament), its appearance was delayed till 1609-1610, when it was published at Douai. The complete work, known as the Rhemish and Douay Version, was reprinted in Rouen in 1615, and after a considerable time revised by Dr Challoner (1749-1750). The translation is really anonymous, but there seems to be little doubt that it was carried out by some of the Romanist refugees connected with the Seminary at Douai and the English college at Reims, the chief amongst them being Gregory Martin, William Allen, Richard Bristow and J. Reynolds. Like the Wycliffe Versions it is merely a secondary rendering from the Latin Vulgate, and it suffered from many of the defects which characterized these versions, extreme literalness, often stilted, ambiguous renderings, at times unintelligible except by a reference to the Latin original, as in Luke xxii. 18, " I will not drink of the generation of the vine," or Phil. ii. 7, " But he exanished himself."
As further examples of this rendering we print the same passages from St Matthew:

(Matthew iii. 1-4.) And in those days came John the Baptist  preaching in the desert of levisry, saying, Doe penance: for the Kingdom of heauen is at hand. For this is he that was spoken of by Esay the Prophet, saying, A voyce of one crying in the desert, prepare ye the way of our Lord, make straight his pathes. And the sayd John had his garment of camels hair, & a girdle of a skin about his loines: and his meat was locumes & vivle hone.

(Matthew vi. 9-13.) Our Father which art in heauen, hallowed be thy name. Let thy Kingdom come. Thy will be done, as in heauen, in earth also. Give vs to day our super stalbrudial bread. And forgive vs our dettes, as we also forgive our dettes. And leade vs not into tentation. But deliuer vs from evil. Amen.

The strongly Latinised vocabulary of this version was not without its influence on the next great venture in English translations of the Bible, the Authorized Version. The English Bible, which is now recognized as the Authorized Version wherever the English language is spoken, is a revision of the Bishops' Bible, begun in 1604, and published in 1611. It arose incidentally out of a Conference between the High Church and the Low Church parties convened by James I. at Hampton Court Palace in January 1604, for the purpose of determining things pretended to be amiss in the Church; which was originally presided over by Dr Reynolds, president of Corpus Christi College, Oxford, the leader and spokesman of the Low Church party, and subsequently on the committee which revised the translation of the Prophets.

No real opposition was offered to the proposal, and the king cleverly sketched out on the moment a plan to be adopted. He 'wished that some special pains should be taken in that behalf for one uniform translation—professing that he could never yet see a Bible well translated in English—and this to be done by the best learned in both the Universities; after them to be reviewed by the bishops and the chief learned of the Church; from them to be presented to the privy council; and lastly to be ratified by his royal authority; and so this whole church to be bound unto it and none other.' He also particularly desired that no notes should be added by way of comment in the margin, since some of those in the Genevan Bible appeared to him 'very partial, untrwe, sodious and savoury to too much dangerous and traitorous conceits.' The appointment of the revisers was a work of much responsibility and labour, and five months elapsed before they were selected and their respective portions assigned to them; but the list of those who began the work, and who, with some few changes in consequence of deaths, brought it to a happy conclusion, shows how large an amount of scholarship was enlisted. It includes Dr Andrews, afterwards bishop of Winchester, who was familiar with Hebrew, Chaldee, Syriack, Greek, Latin, and at least ten other languages, while his knowledge of patristic literature was unrivalled; Dr Overall, regius professor of theology and afterwards bishop of Norwich; Bedwell, the greatest Arabic scholar of Europe; Sir Henry Savile, the most learned layman of his time; and, to say nothing of others well known to later generations, nine who were then or afterwards professors of Hebrew or of Greek at Oxford or Cambridge. It is observable also that these were chosen with reference to party, at least as many of the Puritan clergy as of the opposite party being placed on the committees.

The following list is drawn up in such a way as to show the academic or other position which each of them occupied, and the particular part of the work on which they were engaged.

2 Barlow, Surn and Substance of the Conference . . . in Cardwell's Historie of the Conference (ed. 1844), i. 145-146, a reprint from Burnet's Doc. Annals, ii. 106 ft., "who himself took his list from a copy belonging originally to Bishop Ravis." The list is correct for the year 1604; cf. Westcott, op. cit. pp. 112 f.
3 Compiled chiefly from the list found in Cardwell's Synodalia (ed. 1844), i. 145-146, a reprint from Burnet's Doc. Annals, ii. 106 ft., "who himself took his list from a copy belonging originally to Bishop Ravis." The list is correct for the year 1604; cf. Westcott, op. cit. pp. 112 f.
4 Quoted from G. Burnet's Hist. of Reformation, ii. p. 369 (1681).
translation in hand, and to move and charge as many as being skilful in the tongues and having taken pains in that kind, to send his particular observations to the company either at Westminster, Cambridge or Oxford. (13) The directors in each company to the deans of Westminster and Chester for that place; and the king’s professors in the Hebrew and Greek in either university to be consulted in the translations to be used when they agree better with the text than the Bishops’ Bible; viz. Tyndale’s, Matthew’s, Coverdale’s, Whitchurch’s, Geneva. (15) Besides the said directors before mentioned, three or four ancient ecclesiastical professors of the universities, not employed in translating, to be assigned by the vice-chancellor upon conference with [the] rest of the heads to be overseers of the translations, as well Hebrew as Greek, for the better observation of the fourth rule above specified.

It is not possible to determine in how far all these rules were adhered to. All we know of the way this able work was carried out is preserved in the diary of Dr Miles Smith, who in 1612, bishop of Gloucester, in the name of his fellow-workers gives an account of the manner and spirit in which it was done:

"Neither did we run over the works with that haste that the Septuagint did, if that be true which is reported of them, that they finished it in 72 days. . . The work hath . . . cost the workmen, as light as it seemeth, the pains of twice seven times servant and two days more . . . Truly (good Christian Reader) we never thought from the beginning, that we should need to make a new Translation, nor yet to make of a bad one a good one . . . but to make a good one better, or out of many good ones, one principal good one to be excepted. To be found there were many chosen, that were greater in other mens eyes than in their owne, and that sought the truth rather than their own praise. . . . Neither did we thinke much to consult the Translators or Commentators, Chaldes, HEBREWE, Syriace, Grecete, or Latine, no more or less, than that our translators should thinke and disdaine to reuse that which we had done, and to bring back to the annul that which we had harned: but hauing and vsing as great helpers as were needfull, and feareing no reproach for slovenesse, nor councing praise for expedition, wee haue at the length, through the good hand of the Lord vpon vs, brought the worke to that passe that you see."

From the above it appears that the actual work of revision occupied about two years and nine months, an additional nine months being required for the final preparation for press. The edition appeared at length in 1611, the full title being as follows: The Holy Bible, conteyning the Old Testament, and the New: Newly Translated out of the Original tongues, & with the former Translations diligently compared and revised, by his Majesties speciall commandement. Appointed to be read in Churches. Imprinted at London by Robert Barker, Printer to the Kings most Excellent Maiestie. Anno Dom. 1611: Since that time many millions of this revisers New Testament have been printed, and the general favour and use of it by all English-speaking people of whatever denomination is a testimony to its excellence.

Still the work of improving and correcting went on through the centuries, and a modern copy of the Authorized Version shows no inconceivable departures from the standard edition of 1611. Dr Scrivener imputes some of those differences "to oversight and negligence . . . but much the greater part of them" he holds to "deliberate changes, introduced silently and without authority by men whose very names are often unknown." (A. C. F.)

More ambitious attempts at amending the new version were not lacking, but they all proved fruitless, until in February 1870 the Convocation of Canterbury appointed a committee to consider the subject of revision. The report of this committee, presented in May, was adopted, to the effect "that Convocation should nominate a body of its own members to undertake the work of revision, who shall be at liberty to invite the co-operation of any eminent for scholar-ship, to whatever nation or religious body they may belong"; and that the work two companies were formed: one of the Authorized Version of the Old and New Testaments.

These companies consisted of the following:—1. For the Old Testament:—(a) Appointed by Convocation.—Connon Thirlwall, bishop of St David’s (d. 1875); Alfred Ollivant (1798-1882), bishop of Llandaff; E. Harold Browne (1811-1891), bishop of Ely; Christopher Wordsworth, bishop of Lincoln; and Lord Arthur Hervey (1808-1894), bishop of Bath and Wells; Archdeacon H. J. Rose (d. 1873); William Selwyn (1806-1875), canons of Ely and Lady Margaret professor at Cambridge; Dr John Jebb (1805-1886), canon of Hereford; and Dr William Kay (1820-1886). (b) Invited.—Dr William Lindsay Alexander (1806-1884), congregationalist minister; Thomas Chatterton (1811-1857), professor of Arabic at Oxford, and afterwards (1877) editor of The Times; Frederick Charles Cook (1810-1889), canon of Exeter; Professor A. B. Davidson; Dr Benjamin Davies (1814-1875), professor of oriental and classical languages at Stetson University; Dr John S. Draper (1814-1891), professor of Hebrew at the Divinity School; Frederic Field (1801-1885), fellow of Trinity, Cambridge; Dr C. D. Ginsburg; the Rev. Dr Gorch of Bristol; Archdeacon Benjamin Harrison (1809-1887), Hebraist; the Rev. Stanley Leander (1820-1890), the Rev. Professor M’Gill; Canon Robert Payne Smith (1819-1895), regius professor of divinity at Oxford, dean of Canterbury (1870); Professor J. J. S. Perowne, afterwards bishop of Worcester; the Rev. Edward Harwood, master of Magdalen College, Oxford; the Rev. Professor D. Trench, master of King’s College, London, afterwards dean of Wells; Canon E. Bouverie Pusey; William Wright (1830-1889), the orientalist; W. Aldis Wright, Cambridge. Of these Canons Cook and Pusey declined to serve, and ten members died during the progress of the work. The secretary of the company was Mr W. Aldis Wright, fellow of Trinity, Cambridge.

2. For the New Testament:—(a) Appointed by Convocation.—Samuel Wilberforce, bishop of Winchester; Charles J. Elliott, bishop of Oxford; the Rev. Joseph Hume, bishop of Derry; Samuel Parkman, bishop of Rochester; John M. Stratford, bishop of Derry; Samuel H. Takin, bishop of Salisbury; Edward Bickersteth (1814-1892), proctor of the lower house of convocation; Henry Alford, dean of Canterbury, and Arthur Penrhyn Stanley, dean of Westminster; Joseph Williams Blackstone (1813-1874), canon of St Paul’s, London; Charles Oman (1814-1888), dean of Lincoln. (b) Invited.—The Rev. Dr Joseph Angas, president of the Stepney Baptist College; Dr David Brown; Richard Cheyne Trench, archbishop of Dublin; the Rev. Dr John Eadie (1810-1890); Professor G. R. W. King; the Rev. F. A. Hort; the Rev. W. G. Humphry (1815-1886), vicar of St Martin’s-in-the-Fields, London; the Rev. Benjamin Hall Kennedy, canon of Ely; William Lee (1815-1883), archdeacon of Dublin, and professor of ecclesiastical history in the university; J. B. Lightfoot, afterwards bishop of Durham; the Rev. William Fielding Moulton (1835-1898), Wesleyan biblical scholar; Dr J. H. Newman; the Rev. Samuel Newth (1821-1898), congregationalist, professor of ecclesiastical history at, and afterwards president of, New College, Oxford; Dr A. Roberts; the Rev. G. Viney Smith, bishop of Lincoln; Dean John Alford, Dr Tregelles, Bishop Wilberforce and Dr Eade were removed by death. Only the first vacancy was filled. Dean Merivale was co-opted, and on his resignation Professor, afterwards Archdeacon, the Rev. J. Palmes, and the Rev. J. Troutbeck, minor canon of Westminster, acted as secretary.

Negotiations were opened with the leading scholars of the Protestant denominations in America, with the result that similar companies were formed in the United States. The work of the English revisers was regularly submitted to their consideration; their comments were carefully considered and largely adopted, and their divergences from the version ultimately agreed upon were printed in an appendix to the published work. Thus the Revised Version was the achievement of English-speaking Christendom as a whole; only the Roman Catholic Church, of the great English-speaking denominations, refused to take part in the undertaking. The Church of England, which had put forth the version of 1611, fitly initiated the work, but for its performance most wisely invited the help of the sister churches. The delegates of the Clarendon Press in Oxford, and the syndics of the Pitt Press in Cambridge, entered into a liberal arrangement with the revisers, by which the necessary funds were provided for all their expenses. On the completion of its work the New Testament company divided itself into three committees, working at London, Westminster and Cambridge, for the purpose of revising the Apocalypse.

The work of the Old Testament company was different in some important respects from that which engaged the attention of the New Testament company. The received Hebrew text has undergone but little emendation, and the revisers had before them substantially the same Massoretic text which was in the hands of the translators of 1611. It was felt that there was no sufficient justification to make any attempt at an entire reconstruction of the text on the authority of the versions. The Old Testament revisers were therefore spared much of the
labour of deciding between different readings, which formed one of the most important duties of the New Testament company. But the advance in the study of Hebrew since the early part of the 17th century enabled them to give a more faithful translation of the received text. The value of their work is evident, especially in Job, Ecclesiastes and the prophetic books.

It is the work of the New Testament committee which has attracted most attention, whether for blame or praise. The critical resources at the disposal of scholars in 1611 were very meagre, and the few early manuscripts with which they were acquainted failed to receive the attention they deserved. The results of modern critical methods could not fail to make the incompleteness of the "Revised Text," and of the "Authorised Version," which was based on it, obvious. It had long been the opinion of all competent scholars that a thorough revision was necessary. A proposal in favour of this course was made in Convocation in 1856, but it was not until fourteen years later that the committee was appointed to undertake the work. The revisers' first task was to reconstruct the Greek text, as the necessary foundation of their work. In this difficult duty they were no doubt influenced by Westcott and Hort's edition of the New Testament. These two scholars were members of the committee which prepared the Revised Version, and the question of various readings they had to have exercised a predominant influence. The revisers were privately supplied with instalments of Westcott and Hort's text as their work required them. But it is scarcely necessary to say that the Revised Version is not the work of one or two scholars. Different schools of criticism were represented on the committee, and the most careful discussion took place before any decision was formed. Every precaution was taken to ensure that the version should represent the result of the best scholarship of the time, applied to the work before it with constant devotion and with the highest sense of responsibility. The changes in the Greek text of the Authorised Version when compared with the textus receptus are numerous, but the contrast between the English versions of 1611 and 1885 is all the more striking because of the difference in the method of translation which was adopted. The revisers aimed at the most scrupulous faithfulness. They adopted the plan—deliberately rejected by the translators of 1611—of always using the same English word for the same Greek word. They endeavoured to enable the English reader to follow the correspondences of the original with the closest possible accordance. The solemn repetition of words and phrases, to mark the subtilities of expression, to feel even the strangeness of unusual forms of speech, is avoided.

The revision of the New Testament was completed in 407 meetings, distributed over more than ten years. It was formally presented to Convocation on May 17, 1881. The revision of the Old Testament occupied 792 days, and was finished on June 20, 1884. The revised Apocrypha did not make its appearance until 1895. The text of the Revised Version is printed in paragraphs, the old division of books into chapters and verses being retained for convenience of reference. By this arrangement the capricious divisions of some books is avoided. Various editions of the New Version have been published, the most complete being the edition of the whole Bible with marginal references. These references had their origin in the work of two small sub-committees of the revisers, but they received their present form at the hands of a specially appointed committee. The marginal references given in the original edition of the Authorized Version of 1611 have been retained as far as possible.

The work of the revisers was received without enthusiasm. It was too late for the majority of religious people. Puritans with whom had havoc been played with their proof texts. Ecclesiastical conservatives were scandalized by the freedom with which the traditional text was treated. The advocates of change were discontented with the hesitating acceptance which their principles had obtained. The most vulnerable side of the revision was that on which the mass of English readers thought itself capable of forming a judgment. The general effect of so many small alterations was to spoil the familiar sonorous style of the Authorised Version. The changes were freely denounced as equally petty and vexatious; they were, moreover, too often inconsistent with the avowed principles of the revisers. The method of determining readings and renderings by vote was not favourable to the consistency and literary character of the Version. A whole literature of criticism and apology made its appearance, and the achievement of so many years of patient labour seemed destined to perish in a storm of ressentiments. On the whole, the Revised Version weathered the storm more successfully than might have been expected. Its considerable excellences were better realized by students than stated by apologists. The hue and cry of the critics largely died away, and was replaced by a calmer and juster appreciation.

The work of the revisers has been sharply criticized from the standpoint of specialists in New Testament Greek. Dr Rutherford stated the case briefly and pointedly in the preface to his translation of the Epistle to the Romans (London, 1900). He maintains that "the Greek of the New Testament may never be understood as classical Greek is understood," and accuses the revisers of distorting the meaning "by translating in accordance with Attic idiom phrases that convey in later Greek a wholly different sense, the sense which the earlier translators in happy ignorance had recognized that the context demanded." Familiarity has mitigated the harshness of the revisers' renderings; scholarship, on the whole, has confirmed their readings. The Version has been publicly read in parish churches both in London and in the country. In Canterbury cathedral and Westminster Abbey it has definitely displaced the older Version. Bishops have acquiesced and congregations approved. It is no longer possible to maintain the plausible and damaging contention that the Revised Bible is ill suited for public use. The Upper House of the Convocation of Canterbury in May 1898 appointed a committee to consider the expediency of "permitting or encouraging" the use of the Revised Version in the public services of the Church.

(H. H. H.)*

BIBLIOGRAPHY.—The principal works dealing with the separate versions have been referred to in the text of the article. The following authorities may also be cited:

For the earlier history: J. Lewis, History of English Translations of the Bible (1818); the historical accounts prefixed to Bagster's issue of The English Hexapla and of Forshall and Madden's edition of the Old and New Testament (1850). These are all to a great extent antiquated, their errors being repeated in almost all subsequent accounts of the subject. The only trustworthy authority on the Anglo-Saxon Bible is A. S. Cook's "Introduction on Old English Versions of the Bible," in Biblical Quotations in Old English Prose-writers.

For the 14th and 15th centuries: See A. C. Pusey, The Bible in the Fourteenth Century. For the early printed Bibles: H. Cotton, List of Editions of the Bible (1822), Rheims and Douay (1855); F. Fry, The Bible by Coverdale (1867); Description of the Great Bible, 1539 (1863); Bibliographical Descriptions of the Editions of the New Testament (1879); N. Pocock, The English Gospels of the 15th Century (1873); Prime Wendell, Fifteenth-Century Bibles (1888); John Wright, Early Bibles of America (1893).

For the Authorized Version: F. H. A. Scrivener, The Authorized Edition of the English Bible (1884). See also the early English Bibles, the Authorized Version of 1669, and other Bibles (1859); W. Killburne, Dangerous Errors in ... Bibles (1659); R. C. Trench, On the Authorized Version of the New Testament in connexion with some recent proposals for its revision (2nd ed., 1859).

BIBLE CHRISTIANS, one of the denominations now merged in the United Methodist Church (see United Methodists), so called because its early preachers appealed solely to the Bible in confirmation of their doctrines. The denomination arose in the agricultural districts and fishing villages of north Cornwall and Devon; a district only slightly influenced by John Wesley and the original Methodist movement. The founder was William O'Brien (afterwards Bryant), a Methodist lay preacher of Luxillian, Cornwall. Finding that the people had no evangelical preaching he began an itinerary to supply the need. The circuit of the meetings, the preachers, the services, the services were ignorant and drunken, the parish clergy were slothful, in many cases intemperate, and largely given to fox-hunting. Only in a parish or two was there any approach to religious ministry. O'Brien commenced his labours in north Devon, and in 1815 a small society was formed at Lake Farm, Shebbecar. The movement had the seeds of great vitality in it. In 1819 the first conference was held at Launceston. There were present besides O'Brien one accepted minister—James Thorne—fourteen ministers on trial and fifteen women preachers, a class that was always conspicuous in the denomination. At that conference the work had spread from Ring's Ash in Devon to Morrah, a lonely and desolate parish in west Cornwall. In 1820-1821 Kent, Northumberland, the Scilly and Norman (i.e. Channel) Islands appeared on the list of stations. Then came a serious break. In 1829 there was a severance between the larger part of the new-body and O'Brien, who had claimed to be perpetual president, and to have all property vested in him personally. He tried to establish a system of "full property", and there was a schism. O'Brien left England for America, where he remained for the rest of his life, and his contingent (numbering 356 members and four ministers) returned to the original conference. The growth continued. In 1831 agents were sent to Canada and Prince Edward's Island, in 1830 to South Australia, in 1835 to Victoria, in 1836 to Queensland, in 1837 to New Zealand and in 1838 to China, so that the original O'Brien tradition of fervid evangelicalism was amply maintained.

On O'Brien's departure, James Thorne, the first fully recognized minister, at whose father's farm the connexion started, became its leader. Although reared as an ordinary farm lad, he proved to be a man of singular devotion and spiritual genius. He laid the foundations broadly in evangelicalism, finance, temperance and education, founding in the latter connexion a middle-class school at Shebbecar, at which generations of ministers' sons and numerous students for the ministry have been educated. James Thorne was five times president of the conference and fifteen times secretary. He died in 1872. In this period there was much persecution. Landowners refused sites, and in the Isle of Wight the people imprisoned for many months in a quarry. The preachers were sometimes imprisoned and many times assaulted. The old Methodist body even excommunicated persons for attending "Bryanite" meetings. Partly cooperative with James Thorne and at his death independently, the Church was favoured with the influence of Frederick William Bourne. He was a minister for fifty-five years, and served the Bible Christians as editor, missionary treasurer, book steward and three times president of conference. With him will always be associated the name of Billy Bray, an illiterate but inimitable Cornish evangelist, a memoir of whom, written by Bourne, exerted a great influence in the religious life of the denomination.

In the Bible Christians did not differ from the other Methods. In construction they differed only slightly. There was an annual conference with full legislative power, and ability to hold and dispose of property, composed of an equal number of lay and ministerial representatives meeting together. The local churches were united into districts or parishes, and the larger districts were represented by a quarterly meeting. The quarterly or circuit meetings were in turn organized into twelve districts, eleven in England and one in China. In 1906 the statistics showed 218 ministers, 32,549 members and 652 chapels, 18,750 adult communicants and 51 Sunday schools. The churches have included nearly 1400 full and probationary members in the China district, the first-fruits of two years' labour amongst the Miao tribe. In the various colonial Methodist unions the Bible Christians have contributed the total of 5800 preachers, 49,255 members and 660 chapels.

The community supported a regular ministry from the beginning. Its members have been keen evangelists, trusting largely to "re- vivals" for their success, staunch Radicals in politics and total abstainers to a man. Both ministers and people entered with interest and sympathy into the work of the colonists for themselves, the Methodist New Connexion and the United Methodist Free Church, which was successfully accomplished in 1906. See Methodism.

BIBLE SOCIETIES, associations for translating and circulating the Holy Scriptures. This object has engaged the attention of the leaders of Christendom from early times. In an extant letter to the bishop of A.D. 431, the emperor Constantine requested Eusebius, bishop of Caesarea, to provide him with fifty copies of the Old and New Testament, for use in the principal churches in Constantinople. In 797 Charlemagne commissioned someone to prepare an emended text of the Vulgate; copies of this text were multiplied, not always accurately, in the famous writing-schools at Tours. The first book printed in Europe was the Latin Bible, and Copinger estimates that 124 editions of the Vulgate had been issued by the end of the 15th century. The Italian Bible was printed a dozen times before A.D. 1500, and eighteen editions of the German Bible had already been published before Luther's version appeared.

The Reformation quickened men's interest in the Scriptures to an extraordinary degree, so that, notwithstanding the adverse attitude adopted by the Roman Church at and after the council of Trent, the translation and circulation of the Bible were taken in hand with fresh zeal, and continued in more systematic fashion.

Thus, the Revised French Geneva Bible of 1558, which was issued in 1561, appeared again in 1563 and became a standard text, bears the following note on the title-page: "Imprimé en trois diverses formes en mème temps, pour la commodité et contentement de toutes sortes de personnes, ont esté libellément fournis par quelques gens de bien, qui s'ont chargé de graver pour leur particulier, plusieurs des textes latins et d'après une version française de l'ancien et du nouveau testement, pour le Promouvoir et Propaguer le Gospel de Jesus Christ in New England (founded in 1649) bore the expense of printing both the New Testament and the Bible as a whole (Cambridge, Mass., 1649), and the East India Bible (1668) with a preface to the Pilgrim Fathers, translated into "the language of the Massachusets Indians," whom he evangelized. In Arnauld's Defence (1666) of the famous Port Royal version of the New Testament in French, issued, 1667), he states that it had been printed in many forms and sizes, including very cheap editions for the poor, and goes on to describe how its circulation was promoted by "les sacrifices que l'assembléos les pieux soldats pour faire participer les plus indigent, en leur donnant ce qu'ils pouvaient bien se permettre de donner, mais qui leur coûtait et qui leur prouvait l'oeuvre de leurs dons volontaires." (E. Perault, La Bible en France, p. 152).

To meet the cost of publishing the Finn Bible in 1685, the editor, J. Gesellius, bishop of Åbo, obtained an order from the Swedish government for the appropriation of certain corn-tithes, still known today as "The Bible Tax." In 1853 the Finnish Bible Society began to publish editions of the Scriptures, and distributed 5000 roubles from his privy purse, and ordered that these corn-tithes should again be appropriated to this purpose for five years from 1814. In 1701 at Frankfort-on-Main there appeared a quartino edition of the Bible in French, a translation by the Bishop of Autun, which in his preface: "Quamobrem nullum gratius officium Christianis human nationi a me praestari posse pudari, quam si Psalmorum Aethiopicum, quod aepus illos non alterum quum in membrana manuscriptum habuerit, et pater et filius mandari, et illius quod fuit nomine Societatis Indicis in Habesaita gratius distribuit.

In 1719 appeared the first of numerous editions of the French
New Testament, connected with the name of the Abbé de Barville, a priest of the Oratory at Paris. Impressed by the popular ignorance of the Scriptures, he himself translated, or caused others to translate, the New Testament into French from the Vulgate, and formed an association to distribute copies systematically at low prices. The prefaces to his various editions contain details as to the methods of this association, and repeatedly insist on the importance of reading the Scriptures. (On this Société biblique catholique française see A. Doutre, Histoire de la société biblique protestante de Paris, Paris, 1866, pp. 40-51.)

Christian missions to non-Christian lands have naturally been among the most skillful translators and the most assiduous distributors of the Bible. The earliest complete Arabic Bible was produced at Rome in 671, by the Congregatio de Propaganda Fide. Protestant missionary societies have engaged energetically in the task not only of translating, but of printing, publishing and distributing the Scriptures. Thus the Society for Promoting Christian Knowledge (founded 1698), besides its other activities, has done much to cheapen and multiply copies of the Scriptures, not only in English and Welsh, but in many foreign languages. Early in the 18th century it printed editions in Arabic, and promoted the first versions of the Bible in Tamil and Telugu, made by the Danish Lutheran missionaries whom it then supported in south India. The earliest New Testament (1767) and Old Testament (1783-1801) in the Gaeitic language were produced by the Society for the Propagation of the Gospel in Scotland. The Society for Promoting Christian Knowledge (founded 1709). The S.P.C.K. now publishes versions of the Scriptures (either complete, or in part) in 38 different languages (without reckoning versions of the Prayer Book in 45 other languages); and during 1905-1906 the S.P.C.K. issued in England 116,126 Bibles and 17,783 New Testaments.

The earliest noteworthy organization, formed for the specific purpose of circulating the Scriptures, was the Canstein Bible Institute (Bibelenanstalt), founded in 1710 at Halle in Saxony, by Karl Hildebrand, baron von Canstein (1667-1719), who was associated with P. J. Spener and other leaders of Pietism in Germany. He invented a method of printing, perhaps somewhat akin to stereotyping—though the details are not clearly known,— whereby the Institute could produce Bibles and Testaments in Luther's version at a very low cost, and sell them, in small size, at prices equivalent to 10d. and 3d. per copy, respectively. In 1722 editions of the Scriptures were also issued in Bohemian and Persian. In 1806 the Canstein Bible Society of Saxony was amalgamated in 1861 into the National Bible Society of Scotland.

In England various Christian organizations, which arose out of the Evangelical movement in the 18th century, took part in the work. Among such may be mentioned the Society for Promoting Christian Knowledge among the Poor (1750); and the Society for the Support and Encouragement of Sunday Schools (1783). An institution was founded in 1750 under the name of the Bible Society, but as its sphere was restricted to soldiers and seamen the title was afterwards changed to the Naval and Military Bible Society. The first ship among whose crew it distributed the Scriptures was the "Royal George," which had 400 of this society's Bibles on board when it encountered at Spithead on the 29th of August 1782. The French Bible Society, instituted in 1792, came to an end in 1803, owing to the Revolutionary period.

The British and Foreign Bible Society.—In 1804 was founded in London the British and Foreign Bible Society, the most important association of its kind. It originated in a proposal made to the committee of the Religious Tract Society, by the Rev. Thomas Charles of Bala, who found that his evangelistic and philanthropic labours in Wales were sorely hindered by the dearth of Welsh Bibles. His colleagues in the Religious Tract Society united with other earnest evangelical leaders to establish a new society, which should have for its sole object "to encourage a wider circulation of the Holy Scriptures, without note or comment." This simplicity of aim is combined with a catholicity of constitution which admits the co-operation of all persons interested in the society's object. The committee of management consists of thirty-six laymen, six of them being foreigners resident in or near London; while of the remaining thirty, half are members of the Church of England, and half are members of other Christian denominations. These were for the

Supported by representative Christian leaders, such as Granville Sharp, Zachary Macaulay, William Wilberforce, Charles Grant and Henry Thornton, with Lord Teignmouth, ex-governor-general of India, as its first president, and Dr Porteus, bishop of London, as its friendly counsellor, the new society made rapid progress. It spread throughout Great Britain, mainly by means of auxiliaries, i.e., local societies, affiliated but self-controlled, with subsidiary branches and associations (these last being often managed by women). Up to 1816-1817 the parent society had received from its auxiliaries altogether £420,000. This system continues to flourish. In 1903-1906 the society had about 5,800 auxiliaries, branches and associations in England and Wales, and more than 2,000 auxiliaries abroad, mainly in the British Colonies, many of which undertake vigorous local work, besides remitting contributions to London.

The society's advance was chequered by several controversies. (a) The translation fund was set up for the Bible alone, without more or less, was vehemently attacked by Bishop Marsh and other divines of the Church of England, who insisted that the Prayer Book ought to accompany the Bible. (b) Another more serious attack was made against the foreign auxiliaries of the society on the continent—of Bibles containing the Deuterocanonical books of the Old Testament. In 1826 the society finally resolved that its fundamental law be fully and distinctly recognized as excluding the circulation of foreign auxiliaries of Bibles containing the "usually termed Apocryphal." This step, however, failed to satisfy most of the society's supporters in Scotland, who proceeded to form themselves into independent organizations, grouped for the most part in the addresses and the provinces and granted concessions by the society's supporters in the British Colonies, many of which undertake vigorous local work, besides remitting contributions to London.

This step, however, failed to satisfy most of the society's supporters in Scotland, who proceeded to form themselves into independent organizations, grouped for the most part in the addresses and the provinces and granted concessions by the society's supporters in the British Colonies, many of which undertake vigorous local work, besides remitting contributions to London.

By one of its original laws the British and Foreign Bible Society could circulate no copies of the Scriptures in English other than those of the Authorised Version. This law was widened to include the Revised English Version of 1881-1885.

From its foundation the society has successfully laboured to promote new and improved versions of the Scriptures. In 1804 the Bible in the version of the Committee of the Foreign Missionary Society was first issued in English. The British and Foreign Bible Society had obtained the rights to publish the first complete version in English, and the 1,075,000 copies of it which were issued during the first year were sold for £30,000. By 1816 the number of copies issued had reached 3,000,000, and by 1826 the total sales had risen to 5,000,000 copies.

By 1816 the number of copies issued had reached 3,000,000, and by 1826 the total sales had risen to 5,000,000 copies.
it has its own agencies or secretaries in twenty-seven of the chief cities of the world, and maintains depots in 200 other centres. It employs 920 Christian colporteurs abroad, who sold in 1905-1906 over 2,250,000 volumes. It enjoys 670 native Christian Bible-society workers in the East, in conjunction with forty different missionary organizations. The centenary festival in 1906 was celebrated with enthusiasm by the Reformed Churches and their foreign missions throughout the world. Messages of congratulation came from the rulers of every Protestant nation in Christendom, and a centenary thank-offering of £285,652.50, raised by the sale of 32,000 copies of a gold book was raised for extending the society's work. During the year 1905-1906 the society expended £238,032, while its income was £231,064 (of which £98,040 represented receipts from sales). Up to the 31st of March 1906 the society had expended £1,892,000, and had issued 85,529 copies of the Scriptures—of which more than 70,000,000 were in English.

In Scotland the Edinburgh Bible Society (1800), the Glasgow Bible Society (1812), and other Scottish auxiliaries, many of which had dissociated themselves from the British and Foreign Bible Society after 1826, were finally incorporated (1861) with the National Bible Society of Scotland, which has carried on vigorous work all over the world, especially in China. During 1905, with an income of £27,108, it issued 1,590,881 copies, 907,000 of which were circulated in China. Its total issues from 1861 to 1906 were 26,106,265 volumes.

In Ireland the Hibernian Bible Society (originally known as the Dublin Bible Society) was founded in 1806, and with it were federated kindred Irish associations formed at Cork, Belfast, Derry, &c. The Hibernian Bible Society, whose centenary was celebrated in 1906, had then issued a total of 5,713,857 copies. It sends an annual subsidy to aid the foreign work of the British and Foreign Bible Society.

Other European Societies.—The impulse which founded the British and Foreign Bible Society in 1804 soon spread over Europe, and, notwithstanding the turmoils of the Napoleonic wars, kindred organizations on similar lines quickly sprang up, promoted and subsidized by the British and Foreign Bible Society. Many of these secured royal and aristocratic patronage and encouragement—the tsar of Russia, the kings of Prussia, Bavaria, Sweden, Denmark and Württemberg all lending their influence to the enterprise.

Within fourteen years the following Bible societies were in active operation: the Basel Bible Society (founded at Nuremberg, 1804), the Prussian Bible Society (founded as the Berlin Bible Society, 1850), the Revel Bible Society (1807), the Swedish Evangelical Society (1808), the Dorpat Bible Society (1811), the Riga Bible Society (1812), the Finish Bible Society (1812), the Hungarian Bible Institution (Pressburg, 1812), the Württemberg Bible Society (Stuttgart, 1812), the Swedish Bible Society (1814), the Danish Bible Society (1814), the Saxony Bible Society (Dresden, 1814), the Thuringian Bible Society (Erfurt, 1814), the Berg Bible Society (Eberfeld, 1814), the Hanover Bible Society (1814), the Hamburg-Altona Bible Society (1814), the Lübeck Bible Society (1814), the Netherlands Bible Society (Amsterdam, 1814). These were increased in 1815 by the Brunswick, Bremen, Schleswig-Holstein, Strassburg and Elschenfeld (Saxony) Bible Societies, and the Icelandic Bible Society. In 1816-1817 came the Norwegian Bible Society, the Polish Bible Society and ten minor German Bible Societies. Twelve cantonal societies had also been formed in Switzerland.

Up to 1860 these societies had printed altogether 436,000 copies of the Scriptures, 325,000 of which were received from the British and Foreign Bible Society gifts amounting to over £512,000. The decision of the British and Foreign Bible Society in 1836 with regard to circulating the Apocrypha (see above) modified its relations with the most influential of these continental societies. Some of them were ultimately dissolved or suppressed through political or ecclesiastical opposition, the Roman Church proving especially hostile. But many of them still flourish, and are actively engaged in their original task.

The circulation of the Scriptures by German Bible Societies during 1905 was estimated as follows:—The Prussian Bible Society (Berlin), 182,000 copies; the Württemberg Bible Institute (Stuttgart), 247,000; the Berg Bible Society (Eberfeld), 142,000; the Saxony Bible Society (Dresden), 44,000; the Central Bible Association (Nuremberg), 14,000; the Canstein Bible Institute (Ihle), the Schleswig-Holstein Bible Society, the Hamburg-Altona Bible Society and others, together 55,000.

During 1905, nine cantonal Bible societies in Switzerland circulated altogether 71,000 copies; the Netherlands Bible Society (Amsterdam, 1807), 5,541 volumes, 48,147 of which were in Dutch; the Danish Bible Society circulated 45,289 copies; the Norwegian Bible Society circulated 67,068 copies; and in Sweden the Evangelical National Society distributed about 110,000 copies.

In Italy, by a departure from the traditional policy of the Roman Catholic Church, a range of Bible Societies was formed. "Pious Society of St Jerome for the Dissemination of the Holy Gospels" issued in 1901 from the Vatican press a new Italian version of the Four Gospels and Acts. By the end of 1905 the society announced that over 400,000 copies of this volume had been sold.

In France, the Société bibliographique de Paris, founded in 1818, with generous aid from the British and Foreign Bible Society, had a somewhat restricted basis and scope. In 1833 the Société bibliographique de France et étrangère was formed on wider lines; after its incorporation in 1865, many of its supporters joined the Société bibliographique de France, which dates from 1864, and represents chiefly members of the Église libre, and kindred French Evangelicals. During 1905 its issues were 34,475 copies, while the Société bibliographique de Paris supplied 800 copies.

Of these non-British societies the most noteworthy was established in Russia. In December 1812, while "the last shattered remnants of Napoleon's Grand Army struggled across the ice of the Niemen," the Grand Duke Prussia Alexander I, created a society which was promptly inaugurated at St Petersberg under the presidency of Prince Galitzin. Through the personal favour of the tsar, it made rapid and remarkable progress. Nobles and ministers of state, with the aid of the ecclesiastic and the State of the Russian Church but of the Roman, the Uniat, the Armenian, the Greek and the Lutheran Churches, found themselves constrained to serve on its committees. By the close of 1823 the Russian Bible Society had issued 289 auxiliaries, extending eastwards to Yakutsk and Okskostan and reaching the central Russian provinces. However, Prince Galitzin ceased to be procurator of the Holy Synod, and Seraphim, metropolitan of St Petersberg, became president of the Russian Bible Society. And in 1826, soon after his accession, the tsar approved a bill issued in 1822 by the government, that after it had printed the Scriptures in thirty different languages, seventeen of which were new tongues, and had circulated 600,000 volumes from the Caucasus to Kurchatka. In 1828 Nicholas I., in furtherance of his plans for the establishment of the Russian Bible Society, issued a ukase (see Histoire Russlands unter Nikolaus I. vol. i. chap. ix.). In 1859 St Petersberg became the headquarters of the Russian and Foreign Bible Society, which enjoys special facilities in Russia, and now distributes about 600,000 copies of the Scriptures, in fifteen different languages, within the Russian empire.

In America the earliest Bible society was founded at Philadelphia in 1805. Six more societies—including those of New York and of Massachusetts—were formed during 1809, and other societies, auxiliaries and associations quickly followed. In 1816 a convention of delegates representing 31 of these institutions met at New York and established the American Bible Society, with Elias Boudinot as president. All kindred organizations in the states gradually became amalgamated with this national body, and the convention was completed in 1839 by the adhesion of the Philadelpia Bible Society (which now changed its name to the Pennsylvania Bible Society). Not a few noteworthy versions of the Bible, such as those in Arabic, 15 dialects of Chinese, Armenian and Zulu, and many American Indian, Philippine, and African languages have appeared under the auspices of the American Bible Society. Turkish, classical Chinese, and Korean versions have been made by the American and British societies jointly. The society's foreign agencies extend to China, Japan, Korea, the Turkish empire, Bulgaria, Egypt, Micronesia, Siam, Mexico, Central America, the South American republics, Cuba and the Philippines.

In the year ending March 31st 1909 the income of the Society was $502,345, and it issued 2,113,028 copies of the Scriptures, nearly half of which went to readers outside the United States. The total distribution effected by the American Bible Society and its federated societies had in 1909 exceeded 84,000 volumes, in over a hundred different languages.

AUTHORITIES.—Besides the published reports of the societies in question, the following works may be mentioned:—J. Owen, History of the First Ten Years of the British and Foreign Bible Society (London, 1816-1820); G. Browne, History of the Bible Society (London, 1850); Bertram, Geschichte der Constanstiphenbibelanstalt (Halle, 1863); E. Pétavel, La Bible en France (Paris, 1864); O. Douen, Histoire de la société bibliographique de Paris (Paris, 1868); G. Borrow.

**BIBLIOGRAPHY AND BIBLIOLOGY.** The word βιβλιογραφία was used in post-classical Greek for the writing of books, and as late as 1761, in Fenning’s English Dictionary, a bibliographer is defined as “one who writes or copies books.” The transition from the meaning “a writing of books” to that of “a writing about books,” was accomplished in France in the 18th century—witness the publication in 1763 of the Bibliographie instructive de Bure. In England the new meaning seems to have been popularized by the Rev. Thomas Frognall Dibdin early in the 19th century, while Southey preferred the rival form bibliography, which is now hardly used. Present custom inclines to restrict the province of bibliography to printed books as opposed to manuscripts, and on the other hand recognizes as coming within its scope almost everything in which a book-loving antiquity can be interested, including the history of printing (see Typography), book-binding (q.v.), book-illustration (see Illustrations, and book-collecting (q.v.). The present article is only concerned with bibliography as the art of the examination, collation and description of books, their enumeration and arrangement in lists for purposes of information, and further with the literature of this subject, i.e. with the bibliography of bibliography.

**Examination and Collation.—** Books are submitted to examination in order to discover their origin, or to test statements concerning it which there is reason to doubt, or to ascertain if they are perfect, and if perfect whether they are in their original condition or have been “made up” from other copies. The discovery of where, when and by whom a book, or fragment of a book, was printed, is the most difficult of these tasks, though as regards books printed in the 15th century it has been much facilitated by the numerous facsimiles enumerated under **Incunabula** (q.v.). In the article **book** (q.v.) is given a sketch of characteristics of books in each century since the invention of printing. Familiarity with books of different ages and countries soon creates a series of general ideas as to the dates and places with which any combination of these characteristics may be connected, and an experienced bibliographer, more especially if he knows something of the history of paper, will quickly narrow down the field of inquiry sufficiently to make special search possible.

As regards the correction of mis-statements in early books as to their place and origin, glaring piracies such as the Lyonnese counterfeits of the octavo editions of the classics printed by Aldus at Venice, and the numerous unauthorized editions of works by Luther, professing to be printed at Wittenberg, have long ago been exposed. A different variety of the same kind of puzzle arises from the existence of numerous original editions with fictitious imprints. As early as 1499 a Brescia printer, in order to evade the privilege granted to Aldus, gave to an edition of Politian’s spurious print “Florentiae,” and in the 16th century many controversial books printed in England purported to have been issued in German towns, or with pleasant humour, “at Rome before the castle of S. Angel at the sign of S. Peter.” Only a knowledge of the general characteristics which a book printed at such a place and such a time should possess will secure avoidance of these traps, but when suspicion has been aroused the whole story will often be found in such books as Weller’s Die maskirte Literatur der älteren und neueren Sprachen (1856–1867), and Die falschen und fälschenden Druckbände (1864), Brunet’s Imprimeurs imaginaires et libraires supposés (1866), de Broulliant’s La Liberté de la presse en France; Histoire de Pierre Marboeuf, imprimeur à Cologne, &c. (1883); in the various bibliographies of Erotica and in Brunet’s Manuel de l’Amateur and other handbooks for the use of collectors. A special case of this problem of piracies and spurious imprints is that of the modern photographic or type-facsimile forgery of small books possessing a high commercial value, such as the early editions of the letter of Columbus announcing his discovery of the New World. Bad forgeries of this kind can be detected by the tendency of all photographic processes of reproduction to thicken letters and exaggerate every kind of defect, but the best of these imitations when printed on old paper require a specific knowledge of the originals and often cause great trouble. The type-facsimile forgeries are mostly of short pieces by Tennyson, George Eliot and A. C. Swinburne, printed (or supposed to have been printed—for it is doubtful if some of these “forgeries” ever had any originals) for circulation among friends. These trifles should never be purchased without a written guarantee.

When the edition to which a book belongs is known, further examination is needed to ascertain if it is perfect and in its original state. Where no standard collation is available, this can only be ascertained by a detailed examination of the quires or gatherings of which it is made up (see below). In the earliest books these are often very irregular. A large book was usually printed simultaneously in four or six sections on as many different presses, and the several compositors, if unable to end their sections at the end of a complete quire, would insert a single leaf to give more space, or sometimes leave a blank page or half-page, for lack of matter, occasionally adding the note “Hic nullus est defectus.” A careful examination of the text, a task from which bibliographers often shrink, and a comparison with other editions, are the only remedies in these cases.

If a copy contains the right number of leaves, the further question arises as to whether any of these have been supplied from other copies, or are in facsimile. Few collectors even now are educated enough to prefer copies in the condition in which the ravages of time have left them to those which have been “completed” by dealers; hence many old books have been “made up” with leaves from other copies, or not infrequently from other editions. These meddlesions often defy detection, but proof of them may be found in differences in the height and colour of the paper, in the two corresponding leaves at either end of a folio quire both possessing a watermark, or in their watermarks not corresponding, or (in very early books) by the ornamentation added by hand being in a different style.

When it has been ascertained that a copy contains the right number of leaves and that all these leaves are original, the last point to be settled is as to whether it differs in any respect from the standard collation. Owing to the extreme slowness of the presswork for the first two centuries after the invention of printing, there were more opportunities for making small corrections while an old book was passing through the press than there are in the case of modern ones, and on the other hand the balls used for inking the type sometimes caught up words or individual letters and these were replaced by the compositors as best they could. The small variations in the text noticed in different copies of the First Folio edition of Shakespeare, and again of Milton’s **Paradise Lost**, are probably to be explained by a mixture of these two causes. Where a serious error was discovered after a sheet had been printed off, the leaf on which it occurred was sometimes cut out and a new leaf (called a “cancel”) printed to replace it and pasted on to the rest of the sheet. Variations between different copies of the first edition of Herrick’s **Hesperides** which have puzzled all his editors are due to the presence of several of such cancels. Lastly, a printer when he had printed part of a book might wish to increase the size of the edition, and the leaves already printed off would have to be reprinted, thus causing a combination of identical and different leaves in different copies. The famous 42-line Bible of c. 1455, variously attributed to Gutenberg and to Fust and Schoeffer, and the **Valerius Maximus** printed by Schoeffer in 1471, are instances of editions being thus enlarged while passing through the press. As each book was set up simultaneously on several different presses, the reprinted leaves occur at the beginning of each of the sections.

It should be mentioned that there are books of which it is difficult to find two copies in exact agreement. Either to quicken presswork or to comply with trade-regulations made in the interest of compositors, in some books of which large
numbers were required, e.g. the Paraphrases of Erasmus, the First Prayer-book of Edward VI., and the "Songs and Sonnets," known as Tottel's Miscellany, each form was set up two or more different times. The forms were then used at haphazard for printing, and both at this stage and when the printed sheets came to be stitched almost any number of different combinations might be made. The books named were all printed in the middle of the 16th century, but probably later instances could be produced.

Description.—The ideal towards which all bibliographical work should be directed is the provision in an accessible form of a standard description of a perfect copy of every book of literary, historical or typographical interest as it first issued from the press, and of all the variant issues and editions of it. When such standard descriptions shall have been made, adequately checked and printed, it will be possible to describe every individual copy by a simple reference to them, with a statement of its differences, if any, and an insistence on the points bearing on the special object with which it is being re-described. Only in a few cases has any approach been made to a collection of such standard descriptions. One instance which may be cited is that of the entries of the 15th century books in the *Reporation Biblio
graphicum* of Ludwig Hain (1826-1835), which the addition of an asterisk marks as having been examined by Hain himself in the copies in the Royal library at Munich. The high standard of accuracy of these asterisked entries (save for the omission to note small and marginal corrections) has been so well established, and the *Reporation* is so widely known, that in many catalogues of incunabula the short title of the book together with the number of Hain's entry has been usefully substituted for a long description. Books printed at Oxford up to 1640 can be equally well described by their short titles and a reference to Mr Falconer Madan's *Early Oxford Press* published in 1895. At present the number of works which can thus be taken as a standard is only small, owing partly to the greater and more accurate detail now demanded, partly to the absence of any system of co-operation among libraries, each of which is only willing to pay for catalogues relating exclusively to its own collections. It may be hoped that through the foundation of bibliographical institutes more work of this kind may be done.

A standard description of any book must, as a rule, consist of the following sections, though in the case of works which have no typographical interest, some of the details may be advantageously omitted:—(a) A literal transcript of the title-page, also of the colophon, if any, and of any headings or other portions of the book, of such portions for the text and italic for the title; as to the size or form of the book, the gatherings or quires of which it is made up, with the total number of leaves, the measurement of an uncut copy or of the type-page, a note of the types in which different parts of the book are printed, and a reference to any trustworthy information already in print; (b) A statement of the literal contents of the book and of the points at which they respectively begin; (d) A note giving any additional information which may be needed.

(a) In transcribing the title-page and other parts of the book it is desirable not to omit intermediate words; if an omission is made it should be indicated by three dots placed close together. The end of a line should be indicated by an upright stroke. It is a common practice to make notes to record that titles transcribed are printed, i.e. whether in roman, gothic letter, or italic, and in each case whether in majuscules or minuscules ("upper or lower case"). To do this, however, adds greatly not only to the cost of printing, but also to the liability of error. If roman minuscules are used throughout the book it should be noted, either by a verbal note or by the small imprint of colophon, the method of transliteration which the printer himself would have used should be adopted. Many of the best modern catalogues and bibliographies are disfigured by the occurrence in them of such indications as quotations from authors, due to an unintelligent transliteration of the forms *qvinqve*, *queen*, *evrope*, as they occur on title-pages at a date when *V* was the majuscule form of both *v* and *u*. It is de-

sired to retain the V forms the words should be printed in majus-
cules. If minuscules are used, the words should be transliterated as quinque, queen, Europe, according to the practice of the old printers themselves.

The question of capital letters is what notice should be taken in reproducing the misprints which frequently occur in the original titles. Bibliographers who have satisfied themselves (and their readers) of their own accuracy may reproduce them in silence, though in other instances they will need to set out the facts from "setting them right." Translators of only average accuracy will consult their happiness by indicating the misprint in some way, and the frequent use of (sic), more especially when printed in italics, or of the German (i), being ugly, probably the simplest plan is to add a word or two at the end stating that the misprints in question occur in the original.

(b) The "size" of a book is a technical expression for the relation of the individual leaves to the sheet of paper of which they form a part. An octavo or quarto, for example, which has been folded once, so that each sheet has made two leaves. In a book in quarto, each sheet has been folded twice so as to make four leaves. In an octavo another fold has produced eight leaves, and so on for books in octavos (4mo, 12mo, 64mo, etc.). For books in twelves, twenty-fours, etc., the paper has at some stage to be folded in three instead of in two, and there will be some difference in form according to the way in which this is done. The size of a book printed on handmade paper is very simply recognized by holding up a page to the light. Certain white lines in the paper, called wire-lines, are usually produced in such a way that the text is extended on either side of the wire-line, the height of the sheet forming two pages, as is the case in an octavo, while the width is divided into six instead of into four as in an octavo. The later habit has been to fold the sheet differently, the wire-lines being instead on the side of the sheet from which the height of the sheet the three pages, consequently the line-wires are horizontal" (E. G. Duff, *Early Printed Books*, pp. 206-207).

The recognition of what is meant by the size of a book has been often confused by the erroneous practice of adding the quire in which the book is printed, i.e. the number of quires or pages on each side of which the books are made up necessarily consist of single sheets. If these were so all folios would be in gatherings of two leaves each; all quarto in gatherings of four leaves; all octavos in gatherings of eight leaves, and all folios in gatherings of sixteen leaves. It must be remembered that such distinctions as these are often made for the sake of order, and that, as in an octavo, the number of folios may be divided by four to find the number of leaves in each quire. In 1472 printed signatures came into use. If the quires or gatherings in the book to be described are signed in print, the signatures should be quoted without brackets. If they are not signed, the order of the gatherings should be noted by the letters of the alphabet in square brackets. In each case the number of leaves in each gathering may be indicated by the number of signatures thus shown by the index figures. Thus, six gatherings of eight leaves followed by one of four should be represented by the symbols A-F G. The "make-up" of an old book in original binding is usually sufficiently shown by the strings in the middle of each quire, the size of which may have been noted by the bookseller from the fact that between (roughly) 1750 and 1850, a period during which there was much re-binding of early books, the gatherings before being put into new quires were mostly separately folded and were numbered as gatherings. The order of pages of each gathering are much smoother than the rest. But the only sure way of determining to what book of an old book without printed signatures is a collation by means of the watermark, i.e. the devices with which the papermaker as a rule marked each sheet (see PAPER). In a folio book one of every gathering, and in octavo and quarto books one of every other gathering, should be examined. In a quarto some pairs of leaves will have no watermark; in others it will be found divided by the fold of the paper. As the great majority of books without printed signatures are in folio or quarto, this system is usually the most useful one. The only method of finding the number of gatherings in a given book, and the number of leaves in each gathering, is to examine the quires and signatures of the individual gatherings, which are usually noted in the colophon. It is only in the case of gatherings with one or two signatures (or leaves) that it is necessary to make the usual allowances for the presence or absence of a blank signature, with the exception of gatherings of 6 or 7, which may be either 5 or 6 leaves in number. In the case of gatherings of 6 or 7 leaves, the number of leaves will be either 5 or 6, either in 3 leaves of 5 or 4 leaves of 6, as the case may be.

2 It may be noted that some confusion is caused in descriptions of books by the word "sheet," which should be restricted to the original sheet of paper which, by folding becomes fourto, quarto, etc., being applied also to the double-leaf of fourto. A term more appropriately to this is greatly needed, and as gatherings of two, three, four, &c., of such double-leaves are known technically as duosions, trinosions, quaternions, &c., the double-leaf itself might well be called a "unit."
the sequence of watermarked and un-watermarked leaves, if care-
fully worked out, will mostly reveal the "make-up" of the successive
gatherings.

After the size and sequence of the gatherings has been stated, the
total number of leaves in the book and the method of any
numeration of them given in the book. Any discrepancy between
the total of the leaves assigned to the successive gatherings and the
total as separately counted of course points to an error, and the
reader will no doubt consult the errata list in the book. Errors are
frequently made in the enumeration of the leaves of old books are common, and it is seldom
necessary to point them out in detail. When reference has to be
made to a particular page of an old book, the printed signatures
of the leaves in which is printed the phrase signification leaf (the
"recto" or "verso") marking the upper or under page of the leaf. Thus, "X", recto (some bibliographers prefer the polygonal
shape) and verso (the letter "X"), the upper page of the leaf of a
book, the gathering signed X. Where there are no printed signa-
tures the leaf-number may be given, the letters "a" and "b" above
the numeral taking the place of "recto" and "verso" (or "a" and "b"
below the numeral) to separate the two parts of the leaf if the
reference is to the printed numeral this should be stated. Printed leaf
numeration is found as early as 1470, and became common about ten years later. Printed pagination did not become
common till near the end of the 16th century.

The foregoing details are all directed to showing which leaves of a
book would be printed by the same pull of the press, how it was made
up for binding, and how imperfections in any copy may be
detected. The books are not divided into sections, as is the case with
designated leaves and pages. In the case of modern editions this may be done by adding
one of the trade epithets, pott, foolscap, crown, &c, to the name of
the size, which has thus qualified denotes paper of a particular
measurement (see PAPER SIZE). As, however, these measurements are not
definitely fixed, a book may be cut to a different actual measurement
in inches or millimetres of a page of an uncut copy. In old books
uncut copies are not easily found, and it is useful instead of this
to give the measurement in millimetres of the printed portion of the
page (technically called the "printing area") of the leaves. It is, though
this is subject to a variation of about 3% in different copies, according to the
degree to which they were stamped for printing. To this is added
a statement of the number of lines in the page measured. The
characters employed to denote this, general, or the number of
signatures found by the printer (see INCUNABULA). Finally a reference
to any authoritative description already printed completed the
page. The first was the "classified catalogue" of the first-dated book printed at Augsburg, the Meditations of S. Bonaventura,
printed by Günther Zainer in 1468, should read: Folio (a", b"-p", e"-g", h") 72 leaves. Type-page (') 202 X 120 mm. 135 lines.
Type should be the height of the 18th century.

(c) While many books, and this is especially true of early ones,
contain little or nothing beyond the bare text of a well-known work,
others are well provided, not only with commentaries which are
always referred to, but also with dedicatory letters, prefaces, complimentary verses, indexes and other accessories,
the presence of which it is desirable to indicate. In these cases it is
of great advantage to take a development of the book in which
they occur, noting the leaves or pages on which each begins.
Thus in the first edition (1590) of the first three books of Spenser's
Faerie Queen, the literary contents, their order, and the space
they occupy can be determined by the numbered leaves and pages
according to their signatures and showing what comes on each page.
Thus: A1, recto; A2, verso; dedication, "To the Most
Mightie and Magnificent Empresse Elizabeth"; A3-0, text of b-iii; P4 verso, letter dated 3rd February 1599 to Sir Walter Raleigh expounding the intention of the work; P9 verso, commendatory verses signed W. R[aleigh], Hoby[n], (Gabriel Harvey), R.S., H.B., W. and Ignotus; P13 verso, complimentary sonnets addressed to himself, written in the corners of Oxford, Northumberland and Ormond, Lord Ch. Howard, Lord
Grey of Wilton and Sir W. Raleigh, and to Lady Carew and to
the Ladies in the Court; and " Faults escaped in the print " Quo-
qve, fifteen other sonnets.

Some bibliographers prefer to reverse the order of notation,
title, A1, recto; dedication, A2, verso, &c), and no principle
is sacrificed in doing so, though the order suggested usually works out
the more neatly.

Enumeration and Arrangement.—In the 18th and early 19th
centuries there was a tendency, especially among French writers,
to enumerate the scope of bibliography, on the grounds that it
was the duty of the bibliographer to appraise the value of all the
books he recorded, and to indicate the exact place which each
work should occupy in a logical classification of all literature
based on a previous classification of all knowledge. Bibli-
ographers are now more modest. They recognize that the
classification of human knowledge is a question for philosophers
and men of science, that the knowledge of chemistry and of its
history needed to make a good bibliography of chemistry is alto-
gether extrinsic to bibliography itself; that all, in fact, to which
bibliography can pretend is to suggest certain general principles
of arrangement and to point out to some extent how they may
be applied. The principles are neither numerous nor recondite.
To illustrate the history of printing, books may be arranged
according to the places and printing-houses where these were
produced. For the glorification of a province or county, they
are sometimes grouped under the places where their authors
were born or resided. For special purposes, they may be arranged
according to the language or dialect in which they are written.
But, speaking generally, the choice for a basis of arrangement
rests between the alphabetical order of authors and titles, a
chronological order according to date of publication, a "logical"
or alphabetical order according to subjects, and some combina-
tion of these methods. In exercising the choice the essential
requirement is a really clear idea of the use to which the bibliography,
when made, is to be put. If its chief object be to give detailed
information about individual books, a strictly alphabetical
arrangement "by authors and titles" (i.e. by the names of
authors in their alphabetical order, and the titles of their books
in alphabetical sequence under the names) will be the most
useful, because it enables the student to obtain the information
he seeks with the greatest ease. But while such an alphabetical
arrangement offers the speediest access to individual entries, it
has no other merit, unless the main object of the bibliography
be to show what each author has written. If it is desired to
illustrate the history and development of a subject, or the
literary biography of an author, the books should be entered
dehronologically. If direction in reading is to be given, this
can best be offered by a subject-index, in which the subjects are
arranged alphabetically for speedy reference, and the books
chronologically under the subject, so that the newest is always
at the end. Lastly if the object is to show how far the whole
field has been covered and what gaps remain to be filled, a class
bibliography arranged according to what are considered the logical
subdivisions of the subject has its advantages. It is important,
however, to remember that, if the bulk of the bibliography is
very large, a principle of arrangement which would be clear and
useful on a small scale may be lost in the quantity of pages over
which it extends. An arrangement which cannot be quickly
grasped, whatever satisfaction it may give its author, is useless
to readers, the measure of its utility being the worn condition
of the alphabetical index to which those who cannot carry a
complicated "logical" arrangement in their heads are obliged
to turn, in the first instance, to find what they want. It should
be obvious that any system which necessitates a preliminary
reference to a key or index rests under grave suspicion, and
needs some other counterbalancing gain to justify the loss of time
which it entails. The main classification should always be that
which will be most immediately useful to readers of the books.
To throw light on the history of a subject and to indicate how
far the field is covered are honourable objects for compilers, but
should mostly be held subordinate to practical use. It is note-
worthy also that they may often be better forwarded by means
of an index or table than by the main arrangement. The History
of Hain's Repertorium Bibliographicum, which enumerates in an
alphabetical arrangement of authors and titles some 16,000 books
printed in the 15th century, is a good example of this. For
sixty-five years it was the most useful for its accurate descrip-
tions of individual books, but threw practically no light on the
history of printing. In 1891 Dr Konrad Burger published an
appendix to it containing an Index of Printers, since greatly
enlarged in his index to Dr Copinger's Supplement to Hain (1902).
This gives the imprint of each printer's work to be seen at a
glance, and the impetus given to the study of the history of
printing was very great. But if the book had originally been
arranged under Printers instead of Authors, it would have been
far more difficult to use; its literary value would have been
halved, and the record of the output of each press, now instantly

1 Here specify the page measured.
visible, would have been obscured by the fuller entries causing it to extend over many pages.

The Bibliography of Bibliography.—The zeal of students of early printing has provided the material for an almost exhaustive list (see Incunabula) of the books printed in the 15th century still extant. Of those printed in the years 1501–1536 there is a tentative enumeration in the continuation of Panzer's Annales Typographici (1803), and materials are gradually being collected for improving and extending this. But the projects once formed for a universal bibliography have dwindled in proportion as the output of the press has increased, and the nearest approaches to such a work are the printed catalogue of the library of the British Museum, and that of the Bibliothèque Nationale at Paris, now in progress. Of books of great rarity unrepresented in these catalogues a fairly sufficient record exists in Brunet's Manuel du libraire, the bibliographical collections of Mr W. C. Hazlitt, the Bibliographer's Manual by Lowndes, and the other bibliographical works enumerated in the articles on book-collecting (q.v.). When a universal bibliography was recognized as an impossibility, patriotism suggested the compilation of national bibliographies, and the Bibliotheca Britannica of Robert Watt (Edinburgh, 1824) remains an extraordinary example of what the zeal of a single man could accomplish in this direction. Quérard's La France littéraire (Paris, 1827–1839) sets an example for the future, as does the Ceylonese contribution to this undertaking.

The output for tentative lists of books, with résumés and indexes issued at intervals, exists for most European countries. For the period before these became of importance in England much bibliographical material has been collected in the Catalogues of English Books printed up to the end of the year 1640, issued by the British Museum in 1884, by the John Rylands Library, Manchester, in 1895, and by the University Library, Cambridge, in 1900–1906. A similar record of the rich English collections in the Bodleian library, Oxford, remains a great desideratum, While these substitutes for a universal author catalogue have gradually been provided, similar contributions to a universal subject catalogue have been made in the form of innumerable special bibliographies compiled by students or bookmen interested in special subjects or departments of literature. The most important of these are enumerated in the bibliographical notes appended to articles in this Encyclopaedia, but many attempts have been made to compile separate catalogues of them.

The most recent of these bibliographies of bibliographies naturally take over all that is of any value in their predecessors, and it may suffice therefore to make special mention of the following—Bibliotheca bibliographica. Kritisches Verzeichnis der das Gesamtgebiet der Bibliographie betreffenden Literatur des In- und Auslandes, in systematischem Ordnung bearbeitet von Dr Julius Petschold. Mit alphatisch-chronisch nach Namen und Sachregister (Leipzig, 1866), 8vo, pp. xii. 940; Manuel de bibliographie générale, par Henri Stein (Paris, 1898), 8vo, pp. xx. 896; Manuel de bibliographie historique, par Ch. V. Langlois (Paris, 1901), 12mo, pp. xi. 623; A Register of National Bibliographies published since the year 1867, 8vo, 1918; and articles printed in other Countries, by W. P. Courtney (London, 1905), 8vo, pp. viii. 631.

It should also be noted that the List of Books of Reference in the Registry Room, British Museum, first published in 1813, and the Subject-index of the Modern Works added to the Library of the British Museum in the years 1881–1900, edited by G. K. Fortescue (supplements published every five years), include entries of a vast number of works on bibliography, and that an eclectic list, with a valuable introduction, will be found in Professor Ferguson's Some Aspects of Bibliography (Edinburgh, 1900).

(A. W. Po.)

BIBLIOMANCY 911

BIBLIOGRAPHY (from the Gr. βιβλιοδοτήμα, a book, and μαρτυρία, prophecy), a form of divination (q.v.) by means of the Bible or other books. The method employed is to open the Bible haphazard and be guided by the first verse which catches the eye. Among the Greeks and Romans the practice was known under the name of sortes Homericae or sortes Virgiliana, the books consulted being those of Homer or Virgil.

BIBRACTE, an ancient Gaulish town, the modern Mont Beuvray, near Autun, in France. Here, on a hilltop 250 ft. above sea-level, excavation has revealed a vast area of 330 acres, girt with a stone and wood rampart 3 m. long, containing the remains of dwelling-houses, a temple of Bibractis, and the workshops of iron and bronze workers and enamellers. It was the capital of the Aedui in the time of Julius Caesar. Later on Augustus removed the inhabitants to his new town Augustodunum (Autun), to destroy the free native traditions. Another far more obscure town in Gaul, near Reims, also bore the name.

See Bulliot, Fouilles de Beuvray; Déchelette, Oppidum de Bibracte; also references s.w. Aedui.

BIBULUS, a surname of the Roman gens Calpurnia. The best-known of those who bore it was Marcus Calpurnius Bibulus, consul with Julius Caesar, 39 B.C. He was the candidate put forward by the aristocratical party in opposition to L. Luccessio, who was of the party of Caesar; and bribery was freely used, with the approval of even the rigid Cato (Suetonius, Caesar, 9), to influence his election. But he proved no match for his able colleague. He made an attempt to oppose the agrarian law introduced by Caesar for distributing the lands of Cambyses, but was overpowered and even personally ill-treated by the mob. After making vain complaints in the senate, he shut himself up in his own house during the remaining eight months of his consulship, taking no part in public business beyond fulminating edicts against Caesar's proceedings, which only provoked an attack upon his house by a mob of Caesar's partisans. His conduct gave rise to the jest, that Julius and Caesar were consuls during that year. When the relations of Caesar and Pompey became strained, Bibulus supported Pompey (Plutarch, Cato Minor, 41) and joined in proposing his election as sole consul (52 B.C.). Next year he went to Syria as proconsul and claimed credit for a victory gained by one of his officers over the Parthians, before his own arrival in the province. After the expiration of his term of office, Pompey gave him command of his fleet in the Ionian Sea. He proved himself utterly incapable; his chief exploit was the burning of thirty transports of their fleet by Epirus whither they had succeeded in commandeering Caesar's, and some from Brundisium. He died soon afterwards (48) of fatigue and mortification (Caesar, Bell. Civ. iii. 5–18; Dio Cassius xii. 48). Although not a man of great importance, Bibulus showed great persistency as the enemy of Caesar. Cicero says of him that he was no orator, but a careful writer. By his wife Porcia, daughter of Cato, afterwards married to Brutus, he had three sons. The two eldest were murdered in Egypt by some of the sollicidy of Gabinius; the youngest, Lucius Calpurnius Bibulus, fought on the side of the republic at the battle of Philippi, but surrendered to Antony soon afterwards, and was by him appointed to the command of his fleet. He died (about 32) while governor of Syria under Augustus. He wrote a short memoir of his step-father Brutus, which was used by Plutarch (Appian, B.C. iv. 136; Plutarch, Brutus, 13–23).

BICE (from Fr. brice, a word of doubtful origin, meaning dark-coloured), a term erroneously applied in English to particular shades of green or blue pigments from the French terms teris bis and ashs bis, dark green or blue. These colours are generally manufactured from basic copper carbonates, but sometimes from ultramarine and other pigments.

BICESTER, a market town in the Woodstock parliamentary division of Oxfordshire, England, 12 m. N.E. of Oxford by a branch of the London & North-Western railway. Pop. of urban district (1901) 3023. It lies near the northern edge of the flat open plain of Ot Moor, in a pastoral country. The church of St Eadburch, the virgin of Aylesbury, is cruciform, with a western tower, and contains examples of Norman and each succeeding style. There is, moreover, in the nave a single rude angular arch considered to be Saxan. Incorporated with a farm-house, scanty Perpendicular remains are seen of a
Augustinian priory founded at the close of the 12th century. Bicester has considerable agricultural trade and a brewing industry. It has a fine historic center.

The termination cester, commonly indicating Roman origin, does not do so here, and is perhaps copied from Alchester and Chesterton, 2 m. west of Bicester, where there is a small Roman site, probably a wayside village, at the meeting of roads from the south (Dorchester), west, north-east and east.

Bicester (Bernecestre, Burencestre, Bissiter), according to the Domesday survey, was held by Robert d'Oilly. In 1183 Gilbert Basset founded here an Augustinian priory, which from that date until its dissolution in 1538 became the centre of the industrial life and development of the town. In 1535 William Longspey obtained a grant of a fair at the feast of St Edzburg, and a Friday market is mentioned in the 14th century. Richard II. granted a Monday market and a fair at the feast of St James the Apostle, and in 1440 an additional market was granted to be held in that part of the town called Bury-End, from this date known as Market-End. Bicester never possessed any manufactures of importance, but the fairs and markets were much frequented, and in the 16th century the cattle market was especially famous.

BICHAT, MARIE FRANCOIS XAVIER (1771-1802), French anatomist and physiologist, was born at Thoirieux (Jura) on the 14th of November 1771. His father, a physician, was his first instructor. He entered the college of Nantua, and afterwards studied at Lyons. In mathematics and the physical sciences he made rapid progress, but ultimately devoted himself to the study of anatomy and surgery, under the guidance of M. A. Petit (1766-1811), chief surgeon to the Hôtel Dieu at Lyons. The revolutionary disturbances compelled him to flee from Lyons and take refuge in Paris in 1793. He there became a pupil of P. J. Desault, who was so strongly impressed with his genius that he took him into his house and treated him as his adopted son. For two years he actively participated in all the labours of Desault, prosecuting at the same time his own researches in anatomy and physiology. The sudden death of Desault in 1795 was a severe blow to Bichat. His first care was to acquire himself of the obligations he owed his benefactor, by contributing to the support of his widow and her son, and by conducting to a close the fourth volume of Desault's Journal de Chirurgie, to which he added a biographical memoir of its author. His next object was to reunite and digest in one body the surgical doctrines which Desault had published in various periodical works. Of these he composed Oeuvres chirurgicales de Desault, ou tableau de sa doctrine, et de sa pratique dans le traitement des maladies externes (1790-1799), a work in which, although he professed only to set forth the ideas of another, he develops them with the clearness of one who is a master of the subject. In 1797 he began a course of anatomical demonstrations, and his success encouraged him to extend the plan of his lectures, and boldly to announce a course of operative surgery. In the following year, 1798, he gave public notice that he would give a series of lectures on the operation of the attack of haemoptysis interrupted his labours for a time; but the danger was no sooner past than he plunged into new engagements with the same ardor as before. He had now scope in his physiological lectures for a fuller exposition of his original views on the animal economy, which excited much attention in the medical schools at Paris. Sketches of these doctrines were given by him in three papers contained in the Memoirs of the Société Médicale d'Émulation, which he founded in 1796, and they were afterwards more fully developed in his Traité sur les membranes (1800). His next publication was the Recherches physiologiques sur la vie et sur la mort (1800), and it was quickly followed by his Anatomie générale (1801), the work which contains the fruits of his most profound and original researches. He began another work, under the title Anatomie descriptive (1801-1803), in which the organs were arranged according to his peculiar classification of their functions, but lived to publish only the first two volumes. It was completed on the same plan by his pupils, M. F. R. Buisson (1776-1803) and P. J. Roux (1780-1834).

Before Bichat died, at the age of forty-eight, he had been appointed physician to the Hôtel Dieu, a situation which opened an immense field to his ardent spirit of inquiry. In the investigation of diseases he pursued the same method of observation and experiment which had characterized his researches in physiology. He learned their history by studying them at the bedside of his patients, and by accurate dissection of their bodies after death. He engaged in a series of examinations, with a view to ascertain the changes induced in the various organs by disease, and in less than six months he had opened above six hundred bodies. He was anxious also to determine with more precision than had been attempted before, the effects of remedial agents, and instituted with this view a series of direct experiments which yielded a vast store of valuable material.

Towards the end of his life he was also engaged on a new classification of diseases. A fall from a staircase at the Hôtel Dieu resulted in a fever, and, exhausted by his excessive labours and by prolonged confinement of the mind in the tainted air of the dissecting-room, he died on the 2nd of July 1802. His bust, together with that of Desault, was placed in the Hôtel Dieu by order of Napoleon.

BICHROMATES AND CHROMATES. Chromium trioxide dissolves readily in water, and the solution is supposed to contain chromic acid, \( \text{H}_2\text{CrO}_4 \); the salts of this acid are known as the chromates. In addition to these normal salts, others exist, namely, bichromates, trichromates, &c., which may be regarded as combinations of one molecular proportion of the normal salt with one or more molecular proportions of chromium trioxide. The series will thus possess the following general formulae:

\[
\text{M}_2\text{CrO}_4, \quad \text{M}_2\text{Cr}_2\text{O}_7, \quad \text{M}_2\text{Cr}_3\text{O}_8, \quad \text{&c.}
\]

(\( \text{M} \) = one atom of a normal chromate bichromate trichromate monovalent metal.)

Chromates.—The alkaline chromates are usually obtained by fusion of a chromium compound with an alkaline carbonate and an oxidizing agent, such for example as potassium nitrate or chlorate. The bichromate of chromium (\( \text{Cr}_2\text{O}_7\text{F}_2 \)) may be used in this way as a source of such compounds, being fused in a reverberatory furnace, along with soda-ash and lime, the oxidizing agent in this case being atmospheric oxygen. They may also be prepared by precipitating and bichromating the chromates.

Potassium chromate, \( \text{K}_2\text{Cr}_2\text{O}_7 \), may be prepared by neutralizing a solution of potassium bichromate with potassium carbonate or with caustic potash. It crystallizes in yellow rhombic prisms, and is readily soluble in water, the solution having a bitter taste and an alkaline reaction. When heated in a current of sulphurised hydrogen, it yields a mixture of chromium sesquisulphide and sulphur.

The normal solution of chromic acid dissolves in water, but yields no precipitate with metallic potassium or sodium. It is deliquescent, and yields no precipitate with metallic potassium or sodium. It is deliquescent, and in concentrated form is decomposed by the action of sodium hydroxide. It is decomposed by the action of caustic alkalis, forming silver oxide and an alkaline chromate. The bichromates are usually of a red or reddish-brown colour, those of the alkali metals being readily soluble in water. They are readily decomposed by heat, leaving a residue of the normal chromate and chromium sesquisulphide, and liberating oxygen; ammonium bichromate, however, is completely decomposed.
BICKER—BICYCLE

913

Into chromium sesquioxide, water and nitrogen. Sulphuretted hydrogen and sulphur dioxide reduce them in acid solution to the condition of chromium salts.

Potassium bichromate, $K_2CrO_7$, is obtained by fusing chrome ironore with soda ash and lime (see above), the calcium chromate formed in the process being decomposed by the action of water and carbonate of lime. After the calcium carbonate has settled, the potassium chromate solution is separated by filtration and the solution acidified with hydrochloric acid. The mixture is then heated at a low temperature, and the result is a solution of potassium bichromate, $K_2Cr_2O_7\cdot 7H_2O$, which is moderately soluble in cold water and readily soluble in hot water. The solution is strongly acid in reaction and is very poisonous. Potassium bichromate finds extensive application in organic chemistry as an oxidizing agent. It is also used to a considerable extent in the production of potassium. $K_2CrO_7 + Cr(OH)_3 \rightarrow Cr_2O_7^{2-} + 2KOH$. On the addition of concentrated sulphuric acid to a cold saturated solution of the salt, red crystals of chromium trioxide, $CrO_3$, separate from the solution (see CHROMIUM), whilst when warmed with concentrated hydrochloric acid, potassium chlorochromate is produced. When heated with phosphorus trichloride in a sealed tube to 160 °C, potassium chlorochromate, phosphorus oxychloride, potassium chloride, and a complex chromium oxide (possibly $CrO_3$) are produced (A. Michaelis, Jour. prak. Chem., 1871, ii. 28, p. 364). Potassium chlorochromate finds application in photography, in calico-printing, and in the preparation of bichromate solutions. Sodium bichromate, $Na_2CrO_4\cdot 2H_2O$, may be obtained by the addition of the requisite quantity of chromium trioxide to a solution of sodium chromate. It crystallizes in hyacinth-red prisms, which are very hygroscopic and melt at 320 °C.

**Trichromates.**—The trichromates are obtained by the addition of nitric acid (of specific gravity 1.15) to solutions of the bichromate. They form rhombic crystals of a red or brown red colour and are readily decomposed by warm water, with formation of the bichromate.

**Perchloric Acid.**—By the addition of hydrogen peroxide to a solution of chromic acid, a fine blue coloration due to a perchromic acid is produced which is readily absorbed by shaking out with ether. The following formulæ have been assigned to the compound: $H_2O_2\cdot CrO_3$ (H. Moissan, Comptes rendus, 1883, 97, p. 96); $H_2O_2\cdot CrO_3$ (J. C. Berzelius, Comptes rendus, 1859, ii. 28, p. 364); $CrO_3\cdot xH_2O$ (L. C. A. Barreswil, Ann. chim. et phys., 1847, 3, 20, p. 364); and $CrO_3\cdot 8H_2O$ (T. Fairley, Chem. News, 1876, 33, p. 237). The more recent investigations of H. G. Byers and E. E. Reed (Am. chem. Jour., 1904, 32, p. 902) show that if metallic potassium be added to an ethereal solution of the blue compound at -20 °C, hydrogen is liberated and a purple black precipitate of the perchromate, of composition $KCO_3$ or $KCrO_4$, is produced; this compound is very unstable, and readily decomposes into oxygen and potassium bichromate. Similar sodium, ammonium, magnesium, caesium, potassium, and even silver and zinc salts have been obtained. It is shown that the blue solution most probably contains the acid of composition $H_2CrO_4$, whilst in the presence of an excess of hydrogen peroxide, an acid of composition $HCrO_4$ is produced.

**Bicker (connected by Sketch with bike, to thrust or strike),** an Old English word (traced from the 11th century) involving conflict or dispute. A poetical use, from the noise, is seen in Tennyson's Brook, "to bicker down the valley."

**Bickerstaffe, Isaac** (c. 1715-c. 1812), English dramatist, was born in Ireland about 1735. At the age of eleven he was appointed a page to Lord Chesterfield, then lord lieutenant of Ireland, and subsequently held a commission in the Marines, but was dismissed the service under discreditable circumstances. He was the author of a large number of plays and burlesque farces interspersed with songs, produced between 1760 and 1771. The best-known are Maid of the Mill (found on Richardson's Pamela), The Padlock, He Would if He Could, Love in a Village, The Hypocrite and The Captive. In 1772 Bickerstaffe, suspected of a capital offence, fled to the continent. The exact date of his death is unknown, but he is stated to have been still living in abject misery in 1812.

A full account of his dramatic productions is given in Biographia Dramatica and later editions, edited by Robert Bickerstaffe, his son.

**Bickersteth, Edward** (1786-1850), English evangelical divine, brother of Henry, Baron Langdale, master of the rolls (1836-1881), and uncle of Robert Bickersteth, bishop of Ripon (1857-1884), was born at Kirkby Lonsdale, and practised as a solicitor at Norwich from 1812 to 1815. In 1816 he took orders, and was made one of the secretaries of the Church Missionary Society. On receiving the living of Watton, Hertfordshire, in 1830, he resigned his secretariyship, but continued to lecture and preach, both for the Church Missionary Society and the Society for the Conversion of the Jews. His works include A Scripture Help (London, 1816), which has been translated into many European languages, and Christian Psalmody (London, 1832), a collection of over 700 hymns, which forms the basis of the Hymnal Companion (London, 1870), compiled by his son, E. H. Bickersteth, bishop of Exeter (1855-1890). He was active in promoting the Evangelical Alliance of 1845, strongly opposed the Tractarian Movement, and was one of the founders of the Irish Church Missions, and Parker, Societies.

**Edward Bickersteth** (1814-1892), dean of Lichfield, was his nephew, and Edward Bickersteth (1850-1897), bishop of South Tokyo, his grandson.

**Bicycle** (from prefix bi = two, and Gr. κύκλος, a circle, wheel). The modern bicycle, as developed from the old velocipede (see CYCLING), consists essentially of two wheels placed one behind the other and mounted on a frame which carries a saddle for the rider. Between the wheels is a crank-axle which the rider drives by means of the cranks and pedals, and its motion is transmitted to the rear or driving wheel either by a chain which passes over two chain wheels, one fixed on the crank-axle and the other on the hub of the rear wheel, or, in the chainless bicycle, by a tubular shaft and two pairs of beam-wheels. The rear wheel is usually so arranged that it can turn, when the bicycle is running by its own momentum, independently of the chain and pedals ("free-wheel"), and a variable speed gear is often provided so that the rider may at will alter the ratio between the rate of revolution of the crank-axle and the driving wheel. The front, or steering wheel, is mounted in a fork having its two upper ends brazed into the "crown," to which also the lower end of the steering tube is brazed. The steering tube is mounted by ball bearings in the socket tube, which forms the forward portion of the rear-frame.

The highest quality of materials and the most accurate workmanship are required to produce a first-class bicycle. Steel of 75 to 100 tons per sq. in. tensile strength is used in chains, spokes, &c. In balls and ball-races, hardness without brittleness, and homogeneity are of primary importance. Broken balls, or even traces of wear in bearings, are now seldom heard of in a first-class bicycle. The process of case-hardening, whereby an extremely hard outer skin is combined with a tough interior, has been brought to a high degree of perfection, and is applied to many parts of the bicycle, particularly chains, free-wheels and toothed-wheel variable speed gears. Interchangeability of parts is secured by working to the smallest possible limits of error of workmanship.

**Fig. 1.**—Fig. 1 represents a road-racer. A full roadster would have the handles a little higher relatively to the saddle, and would be provided with mud-guards, free-wheel and sometimes a gear-case and variable speed gear. Fig. 2 shows a lady's bicycle with gear-case and dress-guard. The rear frame of the "diamond" type (fig. 1) is subjected to very small stresses due to vertical load. The front fork and steering post are subject to bending moment due to the reaction from the ground in the direction deb. A slight amount of elasticity in the front fork adds considerably to the comfort in riding over rough roads. When the brake is applied lightly to the front wheel, the reaction from the ground falls more closely along the axis of the front fork, and the bending moment at the crown is diminished. If the front brake is applied harder the reaction from the ground at d may pass through the crown, in which case the bending moment at the crown is zero. Still harder application of the brake causes a bending moment in the opposite direction. In fig. 1 the axes of the top and bottom tubes of the rear frame are produced to meet at a.

---

Fig. 1.
BICYCLE

If the reaction from the ground is in the direction \( da \), the top and bottom tubes are subjected to pure compressive and tensile stresses respectively. When no brake pressure is applied a bending moment due to the overhang \( ab \) is superimposed on these tubes. Thus a short socket head with top tube sloping downwards towards the head gives a stronger frame than a horizontal top tube. The steering axis \( ef \) is arranged so as to cut the ground at \( f \), a little in front of the point of contact \( d \) of the wheel with the ground, giving a slight castor action, and making steering possible without use of the handle-bar. The rake of the steering head (that is the angle between \( ef \) and \( bd \)) and the set of the fork (that is the displacement of the wheel centre \( c \) from the axis \( ef \)) may be varied within tolerably large limits without much affecting the easy steering properties of the bicycle. The transverse stresses on the rear frame due to the action of pedalling are more severe than those due to the vertical load. The pedal pressure is applied at a considerable distance from the central plane of the bicycle, and the pedal pin, cranks, and crank-axle are subjected to a bending moment which is transmitted by the ball bearings to the frame. The down tube from the seat lug to the crank-bracket and the bottom tube from the foot of the steering socket tube to the crank-bracket are made fairly stout to resist this bending moment. Further, the pull of the chain causes a transverse bending moment in the plane of the chain-stays, which must be stiff enough under heavy pedal pressure.

The tubular portions of the frame are made of welded cold-drawn steel tube. The junctions or lugs are usually of malleable cast iron, bored to fit the outside of the tube, the final union being effected by brazing. In very light bicycles the tubes are kept thin, 22 or 24 W.G. (-\( \frac{028}{1} \) in. or -\( \frac{022}{1} \) in. thickness) at the middle, and are strengthened at the ends by internal liners. Or butt-ended tubes are employed, the tubes being drawn thicker at the ends than in the middle. The steering post and fork sides especially should be thus strengthened at their junction with the crown. Some of the best makers use sheet steel stampings instead of cast lugs, greater lightness and strength being secured, and in some cases the sheet steel lugs are inside the tubes, so that the joints are all flush on the outside. The front fork blades are best made of sheet steel stamped to shape and with the edges brazed together to form a hollow tube. The sheet steel that can thus be employed has a much higher elastic limit than a welded steel tube.

Bearings.—Ball bearings are universally used. Each row of balls runs between two ball-races of hardened steel, one on the stationary member, the other on the rotating member. The outer is called the “cup,” and the inner the “cone.” One of the four ball-races is adjustable axially so that the bearing may run without any shake. The ball-races are often made of separate pieces of steel, but the crank-axle usually has the cones formed integral with it, the necessary hardness being obtained by case-hardening. According as the two cups face outwards or inwards the bearing is said to have outward or inward cups, and according as the adjustable ball race is the cone or cup, the bearing is said to be cone-adjusting or cup-adjusting. Fig. 3 shows a ball-bearing hub with outward cups. The hub-shell \( H \) is turned out of mild steel, and the cups \( C \) are forced into the ends of the hub-shell and soldered thereto. A thin washer \( W \) is then spun into the end, for the purpose of retaining oil, and secured by the oil-fed in at the middle of the hub to the balls. The projecting flanges \( S \) are for the attachment of the tangent spokes used to build the hub into the wheel. The spindle \( A \) has the two cones screwed on to it, against a washer, the other \( C \) adjustable. The spindle ends are passed through the back-fork ends and are there adjusted in position by the chain-tension adjusters. After adjustment the nuts \( N \) clamp the spindle securely between the fork-ends. The chain-wheel or free-wheel clutch is screwed on the end of the hub-shell with a right-hand thread. The chain being at the right-hand side of the bicycle (as the rider is seated) the driving pull of the chain tends to screw the chain-wheel tight against the shoulder. A locking-ring \( R \) with a left-hand screw, screwed tight against the chain-wheel, prevents the latter from being unscrewed by back-pedalling. With a free-wheel clutch screwed on the hub, the locking-ring may be omitted.

Fig. 4 shows one end of the cup-adjusting hub, with inward-bearing cups. The cup is made of one piece with the spindle, and the adjusting cup \( C \) is screwed in the end of the hub shell, and locked in position by the screwed locking-ring \( R \). The figure also illustrates a divided spindle for facilitating the removal of the tire for repair when required without disturbing the wheel, bearings, chain or gear-case. The chain side of the hub-spindle, not shown in the figure, is secured to the frame in the usual way: on the left side the spindle projects very little beyond the adjusting cup. A distance washer \( W \) is placed between the end of the spindle \( S \) and the fork-end \( F \). A detachable screw-pin, or the footstep, \( P \), passes through the chain-adjusting draw-bolt \( B \), the fork-end \( F \), and the distance washer \( W \), and is screwed into the end of the spindle \( S \), the hexagon head of the detachable pin drawing all the parts securely together. Unscrewing the detachable pin, the distance washer \( W \) drops out of place, leaving a clear space for removing the tire without disturbing any other part.

The inward-cups bearing retains more oil than the other form. The pressure on a ball being normal to the surface of contact with the ball race, and each ball touching two ball races, the two points of contact must be in line with the centre of the ball. All the lines of pressure on the balls of a row meet at a point \( f \) on the surface of the sphere. The distance between the two points \( f \) (fig. 5) may be called the virtual length of the bearing. Other things being equal, the outward-cups bearing has a greater virtual length than the inward-cups bearing. In hubs and pedals where the actual distance between the two rows of balls is sufficient, this point is of little importance. At the crank-axle bearing, however, where the pedal pressure which produces pressure on the axle bearings is applied at a considerable overhang beyond the ball-races, the greater virtual length of the outward-cups is an advantage.

Fig. 5 shows diagrammatically the usual form of crank-axle bearing which has inward cups and is cup-adjusting. The end of the bracket is split and the cup after adjustment is clamped in position by the clamping screw \( S \). The usual mode of fastening the crank to the axle is by round cotters \( C \) with a flat surface at a slight angle to the axis, thus forming a wedge, which is driven in tight. The small end of the cotter projects through the crank, and is screwed and held in place by a nut. The chain-wheel at the crank-axle is usually detachably fastened to the right-hand crank.
The Rudge-Whitworth crank-bracket has outward cups and is cup-adjusting. The cranks are coterminus. Fig. 6 is a sectional view. The left crank and axle are forged in one piece. The fastening of the right crank and axle-bracket by machined grooves and teeth, this fastening being better mechanically than the cotter type.

Pedals.—The pedal consists of a pedal body, on which the foot of the rider rests, mounted on a pedal pin, which is secured to the end of the crank and turns with it. The pedal body is made in many forms, but usually the bearing-cups are cylindrical, the matel portion being shaped to receive them. The pin screw is made of steel or an aluminum alloy or rolled to the required section, either without joint or jointed by brazing or riveting.

Wood rims are used on racing bicycles, but in England are not popular for roadster bicycles. Holes are drilled at or near the central plane of the rim for the spoke nipples, which have shoulders resting on the outer surface of the rim and shanks projecting through the rim towards the hub. The spoke ends are screwed to the nipples. The shank of the nipple has a square cut on its outside surface by which it can be screwed up. The spoke flanges on the hub are placed far apart and the spread of the spokes gives the wheel lateral stability. Tangential rigidity under driving and braking is obtained by fastening the spokes to the hub tangentially (see figs. 1, and 2). The hub fastening of the spoke is simply obtained by forming a hook and head on the spoke end, and passing it through a hole in the hub flange. The best spokes are butted at the ends, i.e., made of larger diameter than the middle, to allow for screwing at one end and the hook bend at the other.

Chains.—There are two widely used types of chains. The “block” chain (fig. 7) consists of a series of central blocks connected by side plates. The “roller” chain (fig. 8) consists of a series of outside and inside links. The outside link A is made up of two steel side plates P united by two shoudered rivets R. The inside link B consists of two tubular sections of under better conditions as regards lubrication, and (2) presenting a new part of the outside surface of the roller for the next engagement with the chain-wheel. The durability of roller chains is thus much greater than that of block chains, under the usual conditions of cycling.

Chain-wheels.—The pitch line of the chain-wheel is polygonal (fig. 9), a, b, c, d being centres of adjacent joints of the chain when lying in contact with the wheel. The path of the joint a of the chain, relative to the chain-wheel as it enters to and leaves from the chain-wheel, is evidently the curve of a series of circular arcs having centres a, b, c, respectively. Similarly, for the path of the adjacent joints, the fulcrum is the radius less by an amount equal to the radius of the roller, as indicated in fig. 9. But since it is neither necessary nor possible for the chain to roll along the whole path of the tooth, the radii of curvature of the tooth outline may be less than shown in fig. 9. A good arrangement of tooth form is shown in fig. 10.

Owing to the polygonal pitch surfaces of the chain-wheels a chain does not transmit an exact speed-ratio of the shafts. The variation of speed-ratio in a chain with links of equal pitch is approximately inversely proportional to the number of teeth in the smaller chain-wheel, as shown in the table annexed, in which the percentage variation is the maximum speed-ratio — minimum speed-ratio × 100.

The rollers as they come in contact with the chain-wheel strike it with a speed proportional to the angular speed of the chain-wheel and to the pitch of the chain, causing a certain amount of noise.

Chain Adjustment.—To keep the chain running at correct tension, it is necessary to have some adjustment of the distance between the crank-axle and hub. This is obtained either by an eccentric adjustment, a cone adjustment or a change in the length of the hub-spindle or by draw-bolts at the fork-ends. The last method being most common.

Gear-case.—The modern roller chain by makers of repute is so constructed that the need for a gear-case is not so great as when chains were of inferior quality. But if the bicycle is to require the minimum amount of care and attention a gear-case should be fitted.

The Sunbeam gear-case is built into the frame and is oil-retaining, the three push chain-wheels are carried on two-speed gearing and are continually lubricated by an oil-bath. A detachable gear-case is not usually oil-retaining, but serves to exclude grit and mud from the chain.

Crank-axle and Crank-length.—The “gear” of a bicycle is given by the formula \( D/n_1 = n_2 \), where \( D \) is the diameter of the driving wheel in inches, \( n_1 \) and \( n_2 \) the numbers of teeth on the crank-axle and hub-chain-wheels respectively. At each revolution of the crank-axle, the bicycle is moved forward a distance equal to the circumference of the driving wheel. The crank is 8 to 10 inches long, the gear case 20 to 24 inches long, and the frame 24 to 27 inches. The crank length is 64 to 70 inches. Cranks of 75, 8, and 9 inches length can be obtained. The gear case is therefore a frame of special design. The gear should be roughly proportional to the crank-length. The gear 10 times the crank-length is a good proportion for an average rider.

Free-wheels.—A free-wheel clutch transmits the drive in one direction only, allowing the pedals to remain at rest at the will of the rider, while the bicycle runs on. With a free-wheel, chain breakages are reduced or nearly eliminated, as should the chain get accidentally caught the free-wheel comes into play. There are three types of free-wheels—roller, ratchet and friction cone. The roller type was the earliest in use, but has fallen into disfavour. A sectional view of a ball-bearing ratchet free-wheel, with outer cover removed, is shown in fig. 11. The ring on which the teeth of the chain-wheel are carried is screwed on the end of the hub; the chain-wheel is combined with an inner ratchet wheel and is mounted by two rows of ball bearings on the pawl ring. The friction cone type of free-wheel clutch is usually combined with a brake.
inside the hub, the whole combination being termed a coaster hub. Fig. 12 shows a sectional view of the Eadie two-speed coaster, in which the free-wheel clutch and brake are combined with a two-speed gear. The free-wheel clutch action is as follows: A forward pressure of the pedals turns the externally threaded driving cone H in the internally threaded cone F, the latter being thus forced to the right into engagement with the cup J which is screwed to the hub-shell, thus forming a friction driving clutch. The pedals being held stationary the driving cone H is stationary, and the hub running on the ball bearings G, the cone F travels towards the left until released from the cup J, when it also remains at rest. In this type of free-wheel clutch it is essential that there be little or no friction between the screwed surfaces of H and F, else on beginning to pedal, the cone F may remain stationary relative to the driving cone H, and no engagement between F and J may take place, being greater than the hub-shell, as is sometimes done by a light spring between the two, the engagement of the friction clutch must take place as soon as the pedals tend to move faster than the speed corresponding to that of the hub-shell.

Brakes of many types are used, differing in the place and mode of application. The tire brake has entirely done disuse, rim brakes and internal hub brakes being usual. The retarding force that can be applied by a brake is limited by the possibility of skidding the wheel. In riding at uniform speed, without acceleration, the greater part of the load is on the rear-wheel; but as soon as the brake is applied to cause retardation the wheel load distribution is altered, more load being thrown on the front wheel. Thus the most powerful brake is one applied to the front wheel. On the other hand, a front-wheel brake often sets up an unpleasant vibration of the front fork. On a greasy road too powerful a pressure on the front brake may cause a side-slip with no chance of recovery; while with the back-wheel brake recovery is possible. The Bowden system of transmission, which is largely used for cycle brake work, consists of a steel stranded wire inside a flexible tube formed by a closely wound spiral of steel wire, the cable being practically inextensible and the spiral tube practically incompressible; if the ends of the latter be fastened it forms a cable tube for the cable, any movement given to one end of the cable being transmitted to the other end. The spiral tube may be led round any corners, but the frictional resistance of the cable inside the spiral tube increases with the total angle of curvature; thus a change of direction is equivalent to a length of a rope passing over a drum apply. In fitting the Bowden system the total curvature should therefore be kept as small as possible. With a back-peddling rim brake the cycle cannot be wheeled backwards unless a special device is fitted to throw the operating clutch out of action. A back-peddling brake is most conveniently applied inside the hub, as in the coaster hub. In the Eadie two-speed coaster (Fig. 12) the braking action is obtained by the expansion of the steel band L against a pressure between G L carried by the rotating hub-shell. The steel band L is mounted on a disk with a projecting arm, the end of which is clamped to the frame tube. The expansion of the steel band is effected by the movement of the lever K fixed to the cone E. On moving the pedals backward the screw drives the internal part F with which it engages to the left into contact with the cone E. The backward movement of the peddles being continued sets up the required movement of the lever K and applies the brake.

Variable Speed Gears.—The effort required to propel a bicycle varies greatly, according to the conditions of road surface, gradient up or down hills, wind against or behind. To meet these variable conditions, a variable speed-gear is an advantage. The action of the human motor is, however, so entirely different from that of a mechanical motor that it is easy, without practical experience, to overestimate the value of a variable speed-gear. Probably from 50 in. to 80 in. represents the greatest useful range of gear for an average rider. With a gear lower than 50 in., the speed of climbing a steep gradient is so slow that balancing difficulties begin, and it is better to walk up than 80 in. With 7 and 10 in. cranks, the speed for driving, even at 25 miles an hour, is not excessive, provided the conditions are favourable. For those who have not cultivated the art of quick pedalling the useful range of gear under favourable conditions may be extended to say 90 or 100 in. The gear-ratio of two-speed gear is, from the stand-point of the tire, not the best. The suitable gear-ratio for any rider will depend upon his personal physique and the nature of the country in which he rides. For a middle-aged rider of the average physique the gear-ratio of 125:100 is suitable, for those of weaker physique the gear-ratio of 150:120 is advantageous. The greater, say 137.5:100; while for road racing it may be smaller, say 117:100, i.e., a three-speed gear. The low and high gears should be chosen respectively below and above the single gear for which suits the rider, the middle gear being about the same as the rider's usual single gear.

All the variable speed gears at present made consist of toothed wheel mechanism, either in the form of a cone or a crank-bracket, and nearly all are based on the same epicyclic train of toothed wheels. At one speed there is no relative motion of the toothed wheels, the whole mechanism revolving as a solid piece; this is called the "normal" condition of the mechanism. In the first the normal gear is held stationary and the driven part revolves faster or slower than the driver, according as the gearing is up or down. In some two-speed gears the normal gear is the high speed, in others the low. In expressing the gear-ratio, the low speed will be denoted by 100. When the normal gear there is of course no additional friction. The type of two-speed gear used practically settles whether the normal gear is at high or low speed; but it seems best, other things being equal, to work the normal gear as low as possible. The best results are obtained when the normal gear is the low speed, and the higher gear is of course the high speed. The gear-ratio is 133:1:100.

Fig. 14 is a sectional view of the "Hub" of the two-speed gear, the chain-wheel or free-wheel clutch being omitted. In this arrangement the carrier or the driving wheel is fixed to the planet carrier C, and the planet carrier is part of the hub-shell. When the central pinion is held stationary the hub is driven at a less speed than the chain-wheel; the gear-ratio is 100:76-2. The Sunbeam two-speed gear, shown combined with the Eadie coaster hub in Fig. 12, the sun-wheel B can be moved laterally by the striking gear, so as to engage with the chain-wheel C, giving normal gear, or with an internally toothed wheel A fixed to the spindle. The chain-wheel D is mounted on the driving cone H. Thus the gear gives a reduction of speed, the gear-ratio being 100:75.
The Sturmey-Archer three-speed hub (fig. 15) has gear-ratios 125:1:100:80. In the high gear position the epicyclic toothed wheels are to the extreme left position. The chain-wheel is mounted by a free-wheel on a drive-ring, with which the ends of the spindles of the planet wheels engage at high gear. The sun-wheel, not shown in the drawing, and the annular wheel engages with a ring screwed to the hub-shell, by means of keys engaging in notches. The hub is thus driven at a higher speed than the chain-wheel. For normal gear, the striking gear draws the internal mechanism of the hub towards a central position, compressing a spring, disengaging the sun-wheel and locking the drive-ring hub and annular wheel together. At low gear, the internal mechanism is drawn to the right-hand side, where the planet carrier engages with the end plate of the hub by means of claw-clutches. The annular wheel is still engaged with the drive-ring, and the sun-wheel is again locked to the spindle. The hub is thus driven at a lower speed.

**Tandem Bicycles.**—The weight of a roadster tandem is about the same as, or a trifle less than, that of two single roadster bicycles, but the frictional resistance of the mechanism, the rolling resistance of the tires, and the air resistance at a given speed are much less than twice the values for a single bicycle. Consequently, much higher speeds are attained on the level, and free-wheeling down hill is much faster. On the other hand for riding up hill on a moderate gradient, the effort required is about the same as on a single, while on very steep gradients the tandem is at a slight disadvantage. For the full enjoyment of tandem riding, therefore, a two-speed gear is a necessity, while a three-speed gear is better. In the Raleigh tandem (fig. 16) the frame design is such that it can be ridden by two ladies, and the strength and rigidity is sufficient for two heavy-weight riders. The steering and control of the brakes is done by the front rider. Connected steering is employed in some tandems, allowing the rear rider to steer if necessary. For two expert tandem riders, connected steering is slightly more pleasurable than fixed handle grips for the rear rider, but on the other hand, divided control may lead to disaster at a critical moment. Most passengers on a tandem with connected steering unconsciously give the steering a bias in one direction or the other, putting a nervous strain on the steersman which becomes almost intolerable towards the end of a long ride.

**Motor Bicycles.**—Fig. 17 shows a touring motor bicycle, fitted with luggage carrier and stand, the latter for supporting the bicycle while it rests. The average speed of a motor bicycle being much greater than that of a pedal bicycle the stresses on the frame due to moving over rough roads are greater. This necessitates greater strength and weight in all parts—frame, wheels and tires. To take this increased weight up steep gradients requires increased engine power. The weight of a touring motor bicycle may be from 150 to 200 lb. The drive is usually by a V belt of leather, or of canvas and rubber, the angle of the V being 28°. The engine speed at maximum power is from 1500 to 2000 revolutions a minute, and the belt gears down in a ratio varying between $\frac{1}{2}$ and $\frac{1}{4}$ according to the cylinder capacity of the engine. The possibility of the belt slipping slightly is conducive to smoothness of drive; chain-driving, except in combination with a slipping clutch, is too harsh.

The principal defect of the belt drive is that the belt stretches, and on coming to a steep hill may have to be tightened before the bicycle can be driven up. The control of the speed and power of the engine is effected by the throttle, extra air valve and spark advance, the levers for which are all placed within convenient reach of the driver.

As the engine is almost invariably air-cooled, the skilful manipulation of these three levers is essential for satisfactory results. On a good level road when the engine may be working at a small fraction of its maximum power, the proportion of air mixed with the petrol vapour from the carburettor may be great, giving a "weak" mixture, yet one rich enough to be ignited in the cylinder. The throttle valve may be fully open and the spark advanced for high speed; the throttle partially closed and spark retarded for low speed. Under these conditions the engine will run for an indefinite period without overheating. Up a steep gradient, the mixture may have to be made richer by partial closing of the extra air opening, and as more heat is evolved, the cylinder walls may become overheated, unless the engine power is sufficient to keep the bicycle moving through the air at a good speed. As the engine cannot run steadily at low speed, pedalling is resorted to for starting and for riding slowly through traffic. For this purpose, an "exhaust valve lifter" is usually fitted, by means of which the exhaust can be kept permanently open, in order to relieve the resistance to pedalling which the compression stroke would otherwise offer.

The nominal rating of the horse-power of a motor cycle engine is rather vague and indefinite. A 3-H.P. engine may have a cylinder of 76-80 mm. diameter and 76-80 mm. stroke. Twin-cylinder engines, with one crank, are largely used, and some excellent twin-cylinder motor bicycles are made with bevel gear transmission. The chief advantage of the multicylinder engine is the smoother drive obtained.

A trailer with two wheels for carrying a passenger can be attached to a motor bicycle, but the element of risk is increased. A side-car, with an additional wheel, forms a safer passenger carrier.

**BIDA,** a town and administrative district in the British protectorate of Northern Nigeria. Bida town, situated in 9° 5´ N., 6° E., 25 m. N. by E. of Muraji on the Niger, is the capital of the province of Nupe. It was founded in 1859 when Fula rule was established in Nupe, was walled and of considerable size. In 1909 it was connected by railway with Baro, 40 m. S.S.E., the river terminus of the Northern Nigeria railway. The inhabitants, mostly Hausa, carry on an extensive trade and are especially noted for their embossed brass and copper work. The Bida golobets, in which brass and copper are beautifully blende, are of extremely elegant design. The town also boasts a glass factory. The preparation of indigo and the dyeing of cloths are other flourishing industries. The streets are planted with huge shade-trees, so that, as Bida is approached it looks like a forest.

In 1897 there was a two-days' fight outside the walls of Bida between the forces of the emir of Nupe and those of the Royal Niger Company, ending in the defeat of the Fula army (mostly cavalry). The victory was not followed at the time by a British occupation, and the defeated king returned after the withdrawal of the company's troops and re-established himself upon the throne. In 1900 he allied himself with other hostile chiefs and adopted an openly antagonistic attitude to the British government. In 1901 it became necessary for British troops to march on Bida. The emir fled, without fighting, to Kano. Another emir was appointed in his place, and the province of Nupe was placed under British administrative control. Since that date the town has been peaceful and very prosperous. A mission school has been established, and is attended by the sons of the emir and of the principal chiefs, who are destitute of learning to read and write English. The administrative district of Bida includes the town and is the western division of the province of Nupe (q.v.).

(See also Nigeria: History.)
BIDDEFORD—BIDDLE, J.

BIDDEFORD, a city of York county, Maine, U.S.A., on the Saco river, opposite Saco, and on the Atlantic Ocean, 15 m. S.W. of Portland. Pop. (1890) 14,443; (1900) 16,145, of whom 7,340 were foreign-born (mostly French Canadians); (census, 1910) 17,770. Biddeford is served by the Boston & Maine railroad, and is connected by electric lines with Portland and with Old Orchard Beach, a popular summer resort north of the Saco river. The climate and the scenery in and about Biddeford attract summer visitors and there are two resorts, Biddeford Pool and Fortune Rocks within the municipal limits; but the city is chiefly a manufacturing centre (third in rank among the cities of the state in 1905)—good water-power being furnished by the river—and cotton goods, foundry and machine shop products and lumber are the principal products, the first being by far the most important. The value of the factory products increased from $5,472,254 in 1900 to $6,948,722 in 1905, or 27%. There are large quarries of granite of excellent quality. A permanent settlement was established on both sides of the river about 1630 under the leadership of Richard Vines (1585-1651) and was named Saco. In 1718 the present name was adopted. In 1762 that portion of Biddeford which lay east of the river was incorporated as the town of Pepperellborough, for which name Saco was substituted in 1805. Biddeford was incorporated as a city in 1855.

BIDDER, GEORGE PARKER (1836-1878), English engineer, was born at Moreton Hampstead, in Devonshire, on the 14th of June 1836. From a very early age he manifested an extraordinary natural aptitude for calculation, which induced his father, who was a stone-mason, to exhibit him as a "calculating boy." In this way his talent was turned to profitable account, but his general education was in danger of being completely neglected. Interest, however, was taken in him by some of those who happened to witness his performances, among them Sir John Herschel, and it was arranged that he should be sent to school in Camberwell. There he did not remain long, being removed by his father, who wished to exhibit him again, but he was saved from this misfortune and enabled to attend classes at Edinburgh University, largely through the kindness of Sir Henry Jardine, to whom he subsequently showed his gratitude by founding a "Jardine Bursary" at the university. On leaving college in 1854 he received a post in the ordnance survey, but gradually drifted into engineering work. In 1851 he had made in Edinburgh, offered him an appointment on the London & Birmingham railway, and in the succeeding year or two he began to assist George Stephenson in his parliamentary work, which at that time included schemes for railways between London and Brighton and between Manchester and Rugby via the Potteries. In this way he was introduced to engineering and parliamentary practice at a period of great activity which saw the establishment of the main features and principles that have since governed English railway construction. He is said to have been the best witness that ever entered a committee-room. He was quick to discover and take advantage of the weak points in an opponent's case, and his powers of mental calculation frequently stood him in good stead, as when, for example, an apparently casual glance at the plans of a railway enabled him to point out errors in the engineering data that were sufficient to secure rejection of the scheme to which he was opposed. In consequence there was scarcely an engineering proposal of any importance brought before parliament in connexion with which his services were not secured by one party or the other.

On the constructive side of his profession he was also busily occupied. In 1837 he was engaged with R. Stephenson in building the Blackwall railway, and it was he who designed the peculiar method of disconnecting a carriage at each station while the rest of the train went on without stopping, which was employed in the early days of that line when it was worked by means of a cable. Another series of railways with which he had much to do were those in the eastern counties which afterwards became the Great Eastern system. He also advised on the construction of the Belgian railways; with R. Stephenson he made the first railway in Norway, from Christiania to Eidsvold; he was engineer-in-chief of the Danish railways; and he was largely concerned with railways in India, where he strongly and successfully opposed break of gauge on through-routes. But though he sometimes spoke of himself as a mere "railway-engineer," he was in reality very much more; there was indeed no branch of engineering in which he did not take an interest, as was shown by the assiduity with which for half a century he attended the weekly meetings of the Institution of Civil Engineers, of which he was elected president in 1860. He was one of the first to recognize the value of the electric telegraph. That invention was in its infancy when, in 1837, jointly with R. Stephenson he recommended its introduction on a portion of the London & Birmingham and on the Blackwall lines, while three years later he advised that it should be adopted to facilitate the working of the single line between Norwich and Yarmouth. He was also one of the founders of the Electric Telegraph Company, which enabled the public generally to enjoy the benefits of telegraphic communication. In hydraulic engineering, he was the designer of the Victoria Docks (London), being responsible not only for their construction, but also for what was regarded by some people at the time as the foolish idea of utilizing the Ebb and Flow Office. He was engineer-in-chief of the railways of Canada, (1837-1840), of the railways of the British Dominions, and of the railways of New Zealand, (1851-1855). His advice was frequently sought by the government on points both of naval and military engineering. He died at Dartmouth on the 28th of September 1878.

His son, GEORGE PARKER BIDDER, Junr. (1836-1886), who inherited much of his father's calculating power, was a successful parliamentary counsel and an authority on cryptography.

BIDDERY, or BIDRI (an Indian word, from Bedar or Bidar, a town in the Nizam's Dominions), an alloy of copper, lead, tin and zinc used in making various articles and ornaments which are inlaid with gold and silver.

BIDDING-PRAYER (O. Eng. bidan, to pray, cf. Ger. beten), the formula of prayer or exhortation to prayer said in England before the sermon in cathedrals, at university sermons, in the Inn of Court and elsewhere on special occasions. Such formulae are found in the ancient Greek liturgies, e.g. that of St. Chrysostom, in the Gallican liturgy, and in the pre-Reformation liturgies of England. The form varies, but in all the characteristic for Bidders is that of a doxology, sometimes in the form of a prayer to the people to remember in "bidding their beads." In course of time the word "bid" in the sense of "pray" became obsolete and was confused with "bid" in the sense of "command" (from O. Eng. bedan, to offer, present, and hence to announce, or command; cf. Ger. bieten, to offer, gebieten, to command), and the bidding-prayer has come practically to mean the exhortation itself. A form of exhortation which "preachers and ministers shall move the people to join with them in prayer" is given in the 53rd canon of the Church of England (1603).

BIDDLE, JOHN (1615-1662), frequently called the father of English Unitarianism, was born on the 14th of January 1615, at Wotton-under-Edge, in Gloucestershire. He was educated at the grammar school of his native town and at Magdalen Hall, Oxford. He graduated B.A. in 1638 and proceeded M.A. in 1641, and was then appointed to the mastership of the free school in the city of Gloucester, where he was much esteemed. He was master of Westminster for seven years. The character of his prelections was flexibility of manners and sanctity of life. He also diligently prosecuted theological studies, and the results he arrived at were of such a nature as to draw upon him the reprobation of the civic authorities. A treacherous friend obtained the manuscript of his Twelve Arguments drawn out of Scripture, wherein the commonly received opinion touching the deity of the Holy Spirit is clearly and fully refuted; and in December 1645 he was summoned before the parliamentary committee then sitting at Gloucester. By them he was committed to prison, though he was at the time labouring under a dangerous fever. He was released on bail after a short imprisonment, but was in July 1647 called before parliament, which
desired to inquire into his views. After tedious proceedings, during which Sir Henry Vance befriended him, Biddle was committed to custody and his Twelve Arguments, which he had now published, was ordered by parliament to be seized and burned by the hangman. Notwithstanding this and the ordinance of the 2nd of May 1648, visiting denial of the doctrine of the Trinity with death, Biddle issued two tracts, one a Confession of Faith touching the Holy Trinity, and the other The Testimonies of Irenaeus, etc., concerning the one God and the Persons of the Trinity (1648). These were suppressed by government, and the Westminster assembly of divines eagerly pressed for the passing of an act by which heretics like Biddle could be put to death. This, however, was resisted by the army, and by many of the Independent parliamentarians; and after the death of the king, Biddle was allowed to reside in Staffordshire under surveillance. He engaged in preaching and in literary work, particularly an edition of the Septuagint, published by Roger Daniel. In February 1652 the general act of oblivion gave him complete freedom, and his adherents soon began to meet regularly for worship on Sundays. They were called Biddelians, or Socinians, or Unitarians, the name which has now become associated with their opinions. Biddle was not long in peace. He translated some Socinian books, among others the Life of Socinus, and published two catechisms which excited a fury of indignation. He was summoned before the parliament in December 1654 and imprisoned. The dissolution of that body again set him at liberty for a short time, but he was presently brought up for some expressions used by him in a discussion with John Griffin, an illiterate Baptist pastor, who invoked the law against his superior opponent. He was put upon trial, and was only rescued by Cromwell, who sent him (October 1655) out of the way to one of the Scilly Islands, allowed him 100 crowns a year, and in 1658, on the solicitation of many friends, released him. For a few years he lived and taught quietly in the country, but returning to London he was in June 1662 again arrested, and fined 100 pounds. In sum, he was at once committed to prison, where, fevered, by the pestilential atmosphere, carried him off on the 22nd of September 1662.

BIDDLE, NICHOLAS (1786–1844), American financier, was born in Philadelphia on the 8th of January 1786. He was the nephew of a naval officer, Captain Nicholas Biddle (1759–1778), who lost his life while fighting on the American side, during the War of American Independence. After almost finishing the prescribed course at the university of Pennsylvania, the boy went to Princeton, where he graduated with high honours in 1801. During 1804–1807 he was the secretary, first of John Armstrong, minister to France, and then of James Monroe, minister to Great Britain. After his return to America he practised law for several years in Philadelphia, was an associate editor of Denrie’s Portfolio, to which he contributed both prose and verse, and, with much literary skill, prepared from the press of the explorers’ own journals A History of the Expedition under the Command of Captains Lewis and Clark (1814). He was a prominent member of the Pennsylvania House of Representatives in 1810–1811 and of the Senate in 1814–1817, and in 1819 became, by President Monroe’s appointment, one of the five government directors of the Bank of the United States. In 1823 he replaced Langdon Cheves as its president. In general he followed a conservative policy and showed marked ability in the management of the bank, but during President Andrew Jackson’s warfare upon that institution, his character and his policy were violently assailed by the president and his followers. The bank’s national charter lapsed in 1836, but it was immediately chartered by Pennsylvania as the Bank of the United States, of Pennsylvania; and Biddle remained president until 1839, two years before the bank failed. As president of the board of trustees appointed for the purpose, he took an active part in the establishment of Girard College, in accordance with the will of Stephen Girard (q.v.). He died in Philadelphia on the 27th of February 1844.

His son, CHARLES JOHN BIDDLE (1819–1873), served in the Mexican War as a captain of infantry, earning the brevet of major for Chapultepec’s practical law in Philadelphia; was a representative in Congress in 1849–1851; was long editor-in-chief of the Philadelphia Age and published The History of the Great War. He was at the Battle of Covadonga, and after the victory, near the Spanish town of Major Andrés, with a Review of the Statement of it in Lord Mahon’s History of England,” in The Memoirs of the Historical Society of Pennsylvania (1858).

The best account of Nicholas Biddle’s administration of the bank may be found in an excellent work, by Ralph C. H. Catterall, The Second Bank of the United States (Chicago, 1903).

BIDEFORD, a seaport, market town and municipal borough in the Barnstaple parliamentary division of Devonshire, England, 3½ m. S.W. of Barnstaple. Pop. (1901) 8754. It is served by the London & South-Western and the Bideford, Westward Ho & Appledore railways. It is picturesquely situated on two hills rising from the banks of the river Torridge, 3 m. above its junction with the estuary of the Taw. Many of the houses are built with timber framework in Elizabethan style, and the two parts of the town are united by a bridge of 24 arches, originally erected in the 14th century, when the revenue of certain lands was set apart for its upkeep. The church of St Mary, with the exception of the tower, is a modern reconstruction. A stone chanon screen and a Norman font are also preserved. Industries include the manufacture of earthenware, leather goods, sails, ropes and linen, and iron founding. The small harbour has about 17 ft. of water at high tide, but is dry at low tide. Anthracite and a coarse potter’s clay are found near the town. The borough is under a mayor, 4 aldermen and 12 councillors. Area, 3398 acres.

Bideford (Bedford, Byford, Budeford, Bythford) is not mentioned in pre-Conquest Domesday Book according to Domesday it rendered geld for three hides to the king. From the time of the Conquest down to the 18th century, Bideford remained in the possession of the Grenville family, and it first appears as a borough in 1509. The city was incorporated by charter (probably of the reign of Edward I.) from Richard de Grenville, esquire, mayor, and five aldermen. Further, Richard de Grenville, fixing the rent and services due from the burgesses and granting them liberties similar to those in use at the estuary of the Taw and market every Monday. Another charter, dated 1271, confirms to Richard de Grenville and his heirs a market every Monday and five days’ fair yearly at the feast of St Margaret (20th of July). In 1573 Elizabeth granted a charter creating Bideford a free corporate body, with a common council consisting of a mayor, 4 aldermen and 10 chief burgesses (together with a recorder, town-clerk and 2 sergeants-at-mace). This charter also granted the Tuesday market, which is still held, and three annual fairs in February, July and November, now discontinued. A later charter from James I. in 1610 confirmed the rights of the burgesses and increased the number of 5, 7 and 10 chief burgesses instead of 5, and continued in force until the Municipal Corporations Act of 1837, which established 4 aldermen and 12 common councillors. In the 16th century Sir Richard Grenville, one of the famous Mediterranean sailors, did much to stimulate the commercial development of Bideford, which long maintained a very considerable trade with America, Spain and the Mediterranean ports, the import of tobacco from Maryland and Virginia being especially noteworthy. From the beginning of the 17th century the town usually declined and gave place to a coasting trade in timber and coal, chiefly with Wales and Ireland. The silk industry which flourished in the 17th century is extinct.

See John Watkins, History of Bideford (Exeter, 1792).

BIDPAI (or PILPAI), FABLES OF, the name given in the middle ages (from Sanskrit Vidya-pati, chief scholar) to a famous collection of Hindu stories. The origin of them is undoubtedly to be found in the Panca Tantra, or Five Sections, an extensive body of early fables or apologies. A second collection, called the Hitopadesa, has become more widely known in Europe than the first, on which it is apparently founded. In the 6th century A.D., a translation into Pahlavi of a number of these old fables was made by a physician at the court of Chosroes I. Anshirvan, king of Persia. No traces of this Persian translation can be found, but nearly two centuries later, Abdallah-ibn-Mokaffa translated the Persian into Arabic; and his version, which is known as the "Book of Kalilah and Dimna," from two jackals in the first story, became the channel through which a knowledge of the fables was transmitted to Europe. It was translated into Greek by Simeon Sethus towards the close of the 11th century; his version, however, does not appear to have been retranslated into any other European language. But the
Hebrew version of Rabbi Joel, made somewhat later, was translated in the 13th century into Latin by John of Capua, a converted Jew, in his Directorium vitae humanae (first published in 1480), and in that form became widely known. Since then the fables have been translated into nearly every European tongue. There are also versions of them in the modern Persian, Malay, Mongol and Afghan languages.

See Wilson’s analysis of the Pancha Tantra, in the Mem. of the Royal Asiatic Soc. i.; Silvestre de Sacy’s introduction to his edition of the Kalidhal and Dimma (1816); articles by the same in Notizien und Erzählen des S. de la Bib. du Roy, vols. ix. and x.; German translation by Philipp Wolff, Bipsd’s Fabeln (2 vols., 2nd ed., Stuttgart, 1839); the Amor-i Suheli, Persian version of the Fables, translated by E. B. Eastwick (Hertford, 1854); Denley, Pantastic Tantra, German translation and introduction to part 12 vols., Leipzig, 1856; other editions by F. Zirze (ib. 1884) and R. Schmidt (ib. 1901); Max Müller, Essays (Leipzig, 1872), vol. iii., pp. 300, &c.; J. Jacobs’ edition of Sir T. North’s Morall Philosophe of Doni, the earliest English translation of the fables (London, 1688); J. G. N. Keil-Foforne, Kalidhal and Dimmah, or the Fables of Bipsd (Cambridge, 1895), their history, with a translation of the later Syriac version and notes; Léopold Hervieux, Les Fables Bastins, &c. v. Jean de Caspe and ses dérivés (1899); E. G. Briouca, Persian Literatur (1906), ii. 350.

BIEKKICH, the name of Germany, in the Prussian province of Hesse-Nassau, on the right bank of the Rhine, 3 m. S. from Wiesbaden, of which it is the river port, and on the main line of railway from Cologne to Frankfort-on-Main. Pop. (1900) 15,028; (1905) 20,137. The castle of the former dukes of Nassau occupies a fine position on the river bank, and the shady gardens and groves attract large numbers of visitors during the summer. It is an important steamboat station for both passenger and cargo traffic, and besides manufactures of cement, dyes and soap, has a considerable trade in the wines of the district.

BIEDERMANN, FRIEDRICH KARL (1812-1901), German publicist and historian, was born at Leipzig on the 25th of September 1812, and after studying at Leipzig and Heidelberg became professor in the university of his native town in 1838. His early writings show him as an ardent advocate of German unity, and in 1848 he was a member of the town council of Bielefeld, and met at Frankfort in 1848. Becoming a member of the Upper House of the parliament of Saxony, he advocated union under the leadership of Prussia, and, subsequently losing his professorship, he retired to Weimar, where he edited the Weimarsche Zeitung. Returning to Leipzig in 1863 he edited the Deutsche Allgemeine Zeitung, and regained his professorship in 1865. He was again a member of the Saxon Upper House, and from 1871 to 1874 a member of the German Reichstag. He died at Leipzig on the 5th of March 1901. Biedermann’s chief works are: Erinnerungen aus der Paulskirche (Leipzig, 1849); Deutschland im 18. Jahrhundert (Leipzig, 1845-1880); Friedrich der grosse und sein Verhältnis zur Entwickelung des deutschen Geisteslebens (Brunswick, 1859); Geschichte Deutschlands 1815-1871 (Berlin, 1851); Deutsche Volks- und Kulturgeschichte (Wiesbaden, 1901). He also wrote the dramas, Kaiser Heinrich IV. (Weimar, 1861); Kaiser Otto III. (Leipzig, 1862); and Der letzte Bürgermeister von Stralsund (Leipzig, 1870).

BIEG, GABRIEL (c. 1425-1493), scholastic philosopher, was born at Spira (Speier). He was the first professor of theology at the newly founded (1477) university of Tübingen, of which he was twice rector. Some years before his death he entered a religious fraternity. His work consists in the systematic development of the views of his master, William of Occam. His Epistola et Collectarium ex Occomo super libros quatuor Sententiarum (1508, 1512, and various dates) is a clear and consistent account of the nominalist doctrine, and presents the complete system of scholastic thought from that point of view. The individualism of the work, tending necessarily to limit the province of reason and extend that of faith, together with scattered utterances on special points, which gained for Bieel the title of Pseudan Antipapista, had considerable influence in giving form to the doctrines of Luther and Melanchthon. It is the best specimen of the final aspect of scholasticism. His other works also have been frequently reprinted. The title Ultimus Scholasticorum is often wrongly bestowed on Bieel; scholasticism did not cease with him, even in Germany, and continued to flourish long after his time in the universities of Spain.

See Linsenmann, in Theologischen Quartalschrift (1885); Stöckl, phil. d. Mittelalt. ii. 306; H. Plott, Gabriel Bieel als Prediger (Erlangen, 1879); art. s.v. by P. Tscharcikert in Herzog-Hauck, Realencyklopadie, vol. iii. (1907); W. Roscher, Ges. d. Nationalwerk (Munich, 1874), pp. 21-28; and works quoted under SCHEMSTADT.

BIELEFELD, a town of Germany, in the Prussian province of Westphalia, 68 m. S.W. from Hanover on the main line to Cologne. Pop. (1885) 34,03; (1905) 71,797. It is situated at the foot of the Teutoburger Wald, and consists of two portions, separated by the river Lutter, which were first united into one town in 1520. Among its public buildings and institutions are the old town church, with a curious carved altar-piece, the town hall, the gymnasium and the provincial industrial school. On the height above the town is the old castle of Sparenburg, built in the 12th century by Bernhard, count of Lippe. It was for a long time employed as a prison, but was restored after its destruction by fire in 1877 and now contains a historical museum. Bielefeld is the centre of the Westphalian linen industry. It has also important plaster, silk and wool manufactures, as well as extensive bleaching works, and does a very large export trade to all parts of the world in these branches. Engines, automobiles, biscuits, glass, pianos, furniture and paper are also manufactured.

Bielefeld is mentioned as early as the 9th century, as Belanvelde, but its first recorded mention as a town is in 1233. It belonged at this time to the counts of Ravensberg, who often resided in the Sparenburg. It joined the Hansactic league in 1270, and about the same time began to engage in the linen manufacture, which was greatly extended during the 16th and 17th centuries by a number of refugees from the Netherlands. In 1347 the town passed with the countship of Ravensberg to the duchy of Jülich, and in 1666 to that of Brandenburg.

BIELITZ (Czech Bičško, Polish Bielsko), a town of Austria, in Silesia, 80 m. S.E. of Troppau by rail. Pop. (1900) 16,885, chiefly German. It is situated on the Biala river, just opposite the Galician town of Bielsk and possesses a fine view of the town and the surrounding country. It was founded in 1264 by the Sulkowski family, in favour of whom the lordship of Bielszt was raised to a duchy in 1572. It has an important woolen and linen industry, and manufactures of jute and machinery, as well as an active trade, especially of woolens, to the East. The town was founded in the 13th century, and in the 15th and 16th was a fortified place.

BIELLA, a town and episcopal see of Piedmont, Italy, in the province of Novara, 55 m. N.E. of Turin by rail, and 38 m. direct, situated on the S. edge of the lower Alps. Pop. (1901) town, 34,54; commune, 10,267. The old town (1536 ft.) lies on a hill above the new town, and is reached from it by a cable tramway. It has fine palaces with decorations in terra-cotta; and a modern bath establishment is situated here. The new town contains the 15th-century cathedral and the fine Renaissance church of S. Sebastiano; near the former is a baptistery of the 9th century. It is a considerable manufacturing centre for woolens, silks and cottons, electric power being furnished by the torrents descending from the mountains at the foot of which it lies. It is frequented as a tourist centre, and several hydrothermal establishments and mountain resorts lie in the vicinity.

BIENNE, or BIEL, an industrial town in the Swiss canton of Bern. It is built between the N.E. end of the lake of the same name and the point at which the river Suse or Schuees (on the right bank of which it is situated) issues from a deep cleft (called the Taubenloch) in the Jura range. Bienne is 14 m. by rail N.E. of Neuchâtel, and 21 m. N.W. of Bern. Its industrial importance is shown by the fact that it is the site of the West Swiss technical institute, which has departments for instruction in watch-making, in electricity, in engraving and chiseling, and in subjects relating to railway, postal and telegraph matters. Its chief industries are watch-making, chain-making, the manufacture of machines and other objects for use on railways, &c. Its rapidly increasing commercial activity accounts for the rapid rise in its population, which in 1850 was but 3,580, rose in 1870 to 8,165, and in 1900 was 22,016, mainly Protestant,

BIENNE
and two-thirds German-speaking. The parish church of St Benedict dates from 1451, but was restored in 1735—it has some fine 18th-century painted glass in the choir. In the town is the Schwab museum, which is chiefly notable for its fine collection of objects from the lake-dwellings. To the north-west of Bienne two funicular rail ways lead up to Evlird (or Leubringen) and Macolin (or Magglingen), both situated on the slopes of the Jura.

First mentioned in the 12th century, Bienne continued for centuries to be under the jurisdiction of the prince-bishop of Basel. In 1279 (permanently in 1352) it made an alliance with Bern, in 1344 with Soleure, and in 1382 with Fribourg. But its attempts to be admitted into the Swiss Confederation were fruitless, though after it adopted the Reformation in 1525, it was closely associated with the Protestant cantons. In 1798 it was seized by the French, but in 1815, with the greater part of the bishopric of Basel, it became part of the canton of Bern.

See C. A. Bloesch, Geschichte der Stadt Bied (to 1834), (3 vols., Biel, 1855–1856).

BIENNE, LAKE OF, or Bielersee, a lake in Switzerland, S.W. of the town of Bienne, and extending along the southern foot of the Jura range. It is 4 1/2 m. long, 2 1/4 m. wide, and 39 ft. above sea-level, while its surface is 1,425 ft. above the sea-level, and its area 6 1/2 sq. m. It is the Ile de St Pierre, where Rousseau resided for a short time in 1765. Many traces of lake-dwellings have been discovered on the shores of the lake. It receives the river Suze or Scheuss at its north-east end, while the Hagnecan canal leads the waters of the Aar into the lake, as that of Nidau conducts them out again. At the southwestern end the river Thiele or Zihl flows into this lake from that of Neuchâtel.

(B. A. B. C.)

BIEBART, ALBERT (1830–1902), American landscape painter, was born in Solingen, Westphalia, Germany, on the 7th of January 1830, and was taken to the United States when about a year old. In 1853–1856 he studied painting at Düsseldorf. His pictures of the western part of the United States, and particularly the Rocky Mountains, made him widely popular. His "Estes Park, Colorado," is in the collection of the earl of Dunraven; his "Sierra Nevada" (1878) is in the Corcoran Gallery in Washington, and "The Valley of Yosemite" in the James Lenox collection in New York. He received many German and Austrian decorations, and was a chevalier of the French Legion of Honour. He rendered panoramic views with a certain ability, though his work was rather topographically correct and impressive than artistic in conception and execution. He was a member of the National Academy of Design of New York, and is represented by two historical paintings, "The Discovery of the Hudson River," and "The Settlement of California," in the Capitol in Washington, D.C. He died in New York City on the 18th of February 1902.

BIFROST, in Old Norse mythology, the rainbow, which was supposed to form the bridge by which the gods passed between heaven and earth. It was guarded by Heimdall, god of light.

BIGAMY (from Lat. bis, twice, and Gr. γάμος, marriage), in English law, according to the statute now in force (24 and 25 Vict. c. 100, § 57), the offence committed by a person who "being married shall marry any other person during the life of the former husband or wife." In the canon law the word had a rather wider meaning, and the marriage of a cleric in minor orders to a nun came within its scope. At the council of Lyons (A.D. 1274) bigamists were stripped of their privilege of clergy. This canon was adopted and explained by an English statute of 1276; and bigamy, therefore, became a usual counter plea to the claim of benefit of clergy. However, by an act of 1547 every person entitled to the benefit of clergy is to be allowed the same, "although he hath been divers times married to any single woman or single women, or to any widow or widows, or to two wives or more."

A bigamous marriage, by the ecclesiastical law of England, is simply void. By a statute of 1604 the offence was made a felony. This statute, after being repealed in 1828, was re-enacted and reproduced in the Offences against the Person Act 1861. It is immaterial whether the second marriage has taken place within England and Ireland or elsewhere, and the offence may be dealt with in any county or place, where the defendant shall be apprehended or be in custody. The following clause embodies the necessary exceptions to the very general language used in the definition of the offence:—"Provided that nothing in this section contained shall extend to any second marriage contracted elsewhere than in England and Ireland by any other than a British subject, or to any person marrying a second time whose husband or wife shall have been continuously absent from such person for the space of seven years then last past, and shall not have been known by such person to be living within that time, or shall extend to any person who at the time of such second marriage shall have been divorced from the bond of the first marriage, or to any person whose former marriage shall have been declared void by any court of competent jurisdiction." The punishment is penal servitude for not more than seven years or, imprisonment with or without hard labour, not exceeding two years.

A valid marriage must be proved in the first instance in order to support a charge of bigamy. A voidable marriage, such as where the parties were blood relations within prohibited degrees before the Marriage Act 1836, will be sufficient. A marriage which is absolutely void as all such marriages now are, will not. For example, if a woman marry B during the lifetime of her husband A, and after A's death marry C during the lifetime of B, her marriage with C is not bigamous, because her marriage with B was a nullity. In regard to the second marriage (which constitutes the offence) the English courts have held that it is a mere incident of time, whether, but for the bigamy, it would have been a valid marriage or not. An uncle, for example, cannot marry his niece; but if being already married he goes through the ceremony of marriage with her he is guilty of bigamy. In an Irish case, however, it has been held that to constitute the offence the second marriage must be one which, but for the existence of the former marriage, would have been valid. With reference to the case in which the parties to the first marriage have been divorced, it may be observed that no sentence or act of any foreign country dissolving a vinculo a marriage contracted in England by persons continuing to be domiciled in England, for grounds on which it is not liable to be dissolved a vinculo in England will be recognized as a divorce (R. v. Lolley 1812, R. & R. 237). Hence, a divorce a vinculo for adultery, in a Scottish court, of persons married in England, is not within the statute. But if a person charged with bigamy in England can prove that he has been legally divorced by the law of the country where the divorced parties were domiciled at the time (even though the ground on which the divorce was granted was not one that would justify a divorce in England) it will be good defence to the charge. Criminal jurisdiction is always regarded as purely territorial, but bigamy (together with homicide and treason) is an exception to this rule. A British subject committing bigamy in any country may be tried for the same in the United Kingdom (Earl Russell's case, 1901).

In Scotland, at the date of the only statute respecting bigamy, that of 1551, cap. 39, the offence seems to have been chiefly considered in a religious point of view, as a sort of perjury, or violation of the solemn vow or oath which was then used in contracting marriage; and, accordingly, it was ordained to be punished with the proper pains of perjury.

Bigamy was punished in England until the reign of William III. by death, then the penalty changed to life imprisonment and branding of the right hand. An act of George I. still in force lessened the penalty to deportation for seven years or imprisonment for two years with or without hard labour. The Offences against the Person Act 1861 changed deportation to penal servitude.

In the United States the law in regard to bigamy is practically founded on the English statute of 1604, with the exception that imprisonment and a fine, varying in the different states, were substituted instead of making the offence a felony. Congress has passed a statute declaring bigamy within the territories and places within the exclusive jurisdiction of the United
States to be a misdemeanour (U.S. Rev. Stat. § 5352). By statute in some states, upon absence of one spouse from the state for five years without being heard of, the other may marry again without committing bigamy; in other states the period is seven years. In most of the states, prosecutions for bigamy are barred after the lapse of a certain number of years. The marriage wherever solemnized must be a valid marriage according to the law of the place of solemnization; if void there, no prosecution for bigamy can be founded upon it. In some jurisdictions, an honest belief that a prior divorce of one of the parties was valid would be a defence to a prosecution for bigamy, in others the contrary is held.

On the continent of Europe, bigamy is punishable in most countries with varying terms of imprisonment, with or without hard labour, according to the circumstances of the case.

**BIGELOW, JOHN (1817–?)**, American journalist and diplomat, was born at Malden, New York, on the 25th of November 1817. He graduated at Union College in 1835, practised law in New York for several years after 1839; took up journalistic work; was joint owner (with William Cullen Bryant) and managing editor of the New York Courier and Enquirer from 1842 to 1846; was graduated at Paris in 1861–1864, and was minister to France in 1864–1867. While consul, Bigelow wrote *Les États-Unis d'Amérique en 1863* in order to counteract the apparent desire of the French people for a dissolution of the American Union, by showing them the relative importance of the commerce of the northern and southern states. On discovering in 1863 that a French shipbuilder, with the connivance of Napoleon III., was constructing two formidable iron-clads and two corvettes for the use of the Confederacy, he devoted his energies to thwarting this scheme, and succeeded in preventing the delivery of all but one of these vessels to the Confederate agents. In his work entitled *France and the Confederate Navy* (New York, 1888) he gives an account of this episode. In 1855–1866, it devolved upon Bigelow, as minister to France, to represent his government in its delicate negotiations concerning the French occupation of Mexico, and he discharged this difficult task with credit. From 1875 to 1877 he served as secretary of state of New York. He wrote books of travel, of popular biography, or of historical or political discussion, &c., from time to time, but his principal work was *Bigelow's Annals of Franklin*, between 1868 and 1888, of Franklin's autobiography and autobiographical writings, copiously annotated; and of the complete works of Franklin, in ten octavo volumes (New York, 1887–1886). These editions were based in part upon the editor's personal investigations of manuscript sources in France and elsewhere, and supplemented the well-known, long serviceable, but less accurate edition of Jared Sparks (Boston, 1836–1840); they have in turn been supplemented by the edition of A. H. Smythe (10 vols., 1905–1907). Mr Bigelow was a close friend of Samuel J. Tilden, and became his literary executor, editing his speeches and other political writings (1889), publishing a biography in 1893, and editing a two-volume collection of Tilden's letters and literary memorials (1908). He also wrote a biography of William Cullen Bryant (1890). In 1897 he published a volume entitled *The Mystery of Sleep* (2nd ed., 1903). In 1909 he published *Retrospections of an Active Life*.

**BIGGAR, a police burgh of Lanarkshire, Scotland. Pop. (1901) 1366. It is situated about 10 m. S.E. of Carstairs Junction (Caledonian railway). It contains infantry Edinshaw, and is Lying on Biggar Water and near the Clyde, in a bracing, picturesque, upland country, Biggar enjoys great vogue as a health and holiday resort. It was the birthplace of Dr John Brown, author of *Rab and his Friends*, whose father was successor minister in the town. It was created a burgh of barony in 1441 and a police burgh in 1863. St Mary's church was founded in 1545 by Lord Fleming, the head of the ruling family in the district, whose seat, Boghall Castle, however, is now a ruin. John Gledstanes, great-grandfather of W. E. Gladstone, was a burgess of Biggar, and lies in the churchyard. Easter Gledstanes, the seat of the family from the 13th to the 17th century, and the estate of Arthurshie, occupied by them for nearly a hundred years more, are situated about 3½ m. to the north-west of the burgh. On the top of Quothquan Law (1097 ft.), about 3 m. west is a rock called Wallace's Chair, from the tradition that he held a council there prior to the battle of Bannockburn. Lamington, nearly 6 m. south-west, is well situated on the Clyde. It is principally associated with the family of the Baillies, of whom the most notable were Cuthbert Baillie (d. 1514), lord high treasurer of Scotland, William Baillie, Lord Provand (d. 1593), the judge, and William Baillie (fl. 1648), the general whose strategy in opposition to the marquess of Montrose was so diligently stultified by the committee of estates. The ancient church of St Ninian has a fine Norman doorway. Lamington Tower was reduced to its present fragmentary condition in the time of Edward I., when William Hesclog, the sheriff, laid siege to it. The defenders, Hugh de Bradulfe and his son, were slain, and his daughter Marion—the betrothed, or, as some say, the wife of William Wallace—was conveyed to Lanark, where she was barbarously executed because she refused to reveal the whereabouts of her lover. Wallace exacted swift vengeance upon this outrage. The town is in the police burgh of Blantyre, and is the seat of the parish of Biggins, of the same name. The town and the parish of Blantyre were in Roman times.

**BIGGLESWADE, a market town in the Biggleswade parliamentary division of Bedfordshire, England, 41 m. N. by W. of London by the Great Northern railway. Pop. of urban district (1901) 5120. It lies on the east bank of the Ivel, a tributary of the Ouse, in a flat plain in which vegetables are largely grown for the London markets. The town is a centre of this trade.

Biggleswade (Biggleswade, Beckleswade, Bickleswade) is an ancient borough by prescription which has never returned representatives to parliament. The borough court was held by the lord chief justice at the time of Edward III., when Sir John Biggleswade was the sheriff of the county. In the 14th century Sir John Biggleswade formed part of the jointure of the queens of England. Owing to its important position on the Roman road to the north the town became an agricultural centre for the surrounding district. In 1335 Edward III. renewed the bishop's licence to hold a Monday market, and annual fairs were held here from very early times. Those for horses are mentioned as famous by Camden. In addition to agriculture, Biggleswade was formerly engaged in straw-plaiting and lace manufacture.

**BIGHT** (O. Eng. bight, bend; cf. Ger. Bucht, a bay, and biegen, to bend, a nautical term for the loop or bent part of a rope, as distinguished from the ends; also a geographical term for a bay between two distinct headlands, or with a shallow curve, e.g. the Bight of Benin, the Great Bight of Australia.

**BIGNON, JÉRÔME** (1580–1666). French lawyer, was born at Paris in 1580. He was uncommonly precocious, and under his father's tuition had acquired an immense mass of knowledge before he was ten years of age. In 1600 was published a work by him entitled *Chorographie, ou description de la Terre Sainte*. The great reputation gained by this book introduced the author to Henry IV., who placed him for some time as a companion to the duc de Vendôme, and made him tutor to the dauphin, afterwards Louis XIII. In 1604 he wrote his *Discours de la ville de Rome*, and in the following year his *Traité sommaire de l'élection du pape*. He then devoted himself to the study of law, wrote in 1610 a treatise on the precedence of the kings of France, which gave great satisfaction to Henry IV., and in 1613 edited, with learned notes, the *Formule* of the jurist Marçulé. In 1620 he was made advocate-general in the great council, and shortly afterwards a councillor of state, and in 1626 he became advocate-general to the parlement of Paris. In 1641 he resigned his official dignity, and in 1642 was appointed by Richelieu to the charge of the royal library. He died in 1656.

**BIGNON, LOUIS PIERRE ÉDOUARD, BARON** (1771–1841), French diplomatist and historian, born on the 3rd of January 1771, was the son of a dyer at Rouen. Though he had received a good education, he served throughout the early part of the revolutionary wars without rising above the rank of private. In 1797, however, the attention of Talleyrand, then minister of foreign affairs, was called to his exceptional abilities by General
Huet, and he was attached to the diplomatic service. After serving in the legations in Switzerland and the Cadiopine republic, he was appointed in 1790 attaché to the French legation at Berlin, of which three years later he became chargé d'affaires. As minister-plenipotentiary at Cassel, between the years 1804 and 1806, he took a prominent share in the formation of the Confederation of the Rhine; and after the battle of Jena he returned to Prussia as administrator of the public domains and finances. He filled a similar function in Austria after the battle of Wagram. At the end of 1810 he became French resident at Warsaw and was for a couple of years supreme in the affairs of the grand duchy.

The preparation of a constitution for Poland, on which he was engaged, was, however, interrupted by the events of 1812. Bignon, after a short imprisonment at the hands of the allies, returned to France in time to witness the downfall of Napoleon. During the Hundred Days he once more entered Napoleon's service, and, after Waterloo, as minister of foreign affairs under the executive commission, it was he who signed the convention of the 3rd of July 1815, by which Paris was handed over to the allies. Bignon did not re-enter public life until 1817, when he was elected to the chamber of deputies, in which he served until 1830, during which period his opposition to the reactionary policy of successive governments. His great reputation and his diplomatic experience gave a special weight to the attacks which he published on the policy of the continental allies, two of his works attacking special attention, Du Congrès de Troppau au Examen des présentations des monarchies absolues à l'égard de la monarchie constitutionnelle de Naples (Paris, 1821), and Les Cabinets et les peuples depuis 1815 jusqu'à la fin de 1822 (Paris, 1822).

The revolution of 1830, which brought his party into power, only led to a very temporary resumption of office by Bignon. He was for a few weeks minister of foreign affairs in the first government of Louis Philippe, and again for a few weeks minister of public instruction. But the idea of making him responsible for the foreign policy of France could not be realized owing to the necessity under which Louis Philippe lay of courting the goodwill of the powers, whom Bignon had offended by his outspoken writings. Elected deputy in 1831 and member of the chamber of peers in 1839, he withdrew for the most part from politics, to devote himself to his great work, the Histoire de France sous les rois absolus des rois, 1246-1515 (18 vols., 1849-1850). This history, while suffering from the limitations of all contemporaneous narratives, contains much that does not exist elsewhere, and is one of the best-known sources for the later histories of Napoleon's reign.

See Mignet, Notice historique sur la vie et les ouvrages de M. Bignon (1848).

BIGOD—BIG RAPIDS

Roger was succeeded as 3rd earl by his son, Hugh, who died in 1225, leaving a son, Roger (d. 1270), who became 4th earl of Norfolk. Through his mother, Matilda, a daughter of William Marshal, earl of Pembroke, Roger obtained the office of marshal of England in 1246. He was prominent among the barons who wrested the control of the government from the hands of Henry III, and assisted Simon de Montfort. The Earl married Isabella, daughter of William the Lion, king of Scotland, but left no sons.

Hugh, the 3rd earl, left a younger son, Hugh (d. 1260), who was chief justice of England from 1258 to 1260, and who fought for Henry III at the battle of Lewes. The latter's son, Roger, succeeded his uncle Roger as 5th earl of Norfolk in 1270. This earl is the hero of a famous altercation with Edward I in 1297, which arose out of the king's command that Bigod should serve against the king of France in Gascony, while he went to Flanders. The earl asserted that by the tenure of his lands he was only compelled to serve across the seas in the company of the king himself, whereupon Edward said, "By God, earl, you shall either go or hang," to which Bigod replied, "By the same oath, O king, I will neither go nor hang." The earl gained his point, and after the war had left for France he and Humphrey Bohun, earl of Hereford, prevented the collection of the charters in this year and again in 1301. Stubbs says Bigod and Bohun "are but degenerate sons of mighty fathers; greater in their opportunities than in their patriotism." The earl died without issue in December 1306, when his title became extinct, and his estates reverted to the crown. The Bigods held the hereditary office of steward (dapsifer) of the royal household, and their chief castle was at Framlingham in Suffolk.

BIGOT, one obstinately and intolerantly holding particular religious opinions, who refuses to listen to reason and is ready to force others to agree with him; hence also applied to one who holds similar views on any subject. The early meaning of the word in English, at the end of the 16th century, was that of a religious hypocrite. The origin is obscure; it appears in French, in the form of nöt bigot in the 12th-century romance of Girard of Roussillon, where it is applied to certain tribes of southern Gaul, and in the Roman du Rou de Wace (d. 1257) as an abusive name given by the French to the Normans:

"Mout on Franchois Normans laidis
de mesfais et des mesdiz,
Sagou loir dient reproveris,
et clamiez Bigos et Drasciers."

To this use has been attached the absurd origin from "ne se bi
god," the words in which, according to the 12th century chronicle, Rollo, duke of the Normans, refused to kiss the foot of Charles III., the Simple, king of the West Franks. The word may have some connexion with a corruption of Vissoght, a suggestion to which the use in the Girard romance lends colour. The meaning changed in French to that of "religious hypocrite" through the application, in the feminine bigole, to the members of the religious sisterhoods called Beguines (q.v.).

BIG Rapids, a city and the county-seat of Mecosta county, Michigan, U.S.A., on both sides of the Muskegon river, 56 m. N. by E. of Grand Rapids, in the west central portion of the lower peninsula. Pop. (1860) 5200; (1870) 10,084, of whom 381 were foreign-born; (1910, U.S. census) 4570. It is served by the Père Marquette and the Grand Rapids & Indiana railways. Big Rapids is the seat of the Ferris Institute (opened 1884, incorporated 1894), a large private co-educational school, founded by W. N. Ferris. The river, which falls 15 ft. within the city limits, is dammed a short distance south of the city, and 16,000 horse-power is generated, part of which is transmitted to the city. The principal manufactures are lumber and furniture, and saw-filing and filing-room machinery. Big Rapids, named from the falls of the Muskegon here, was settled in 1854, was platted in 1859 and was chartered as a city in 1860.
BIGSBY—BIHARI

BIGSBY, JOHN JEREMIAH (1792-1881), English geologist and physician, the son of Dr John Bigsbey, was born at Nottingham on the 14th of August 1792. Educated at Edinburgh, where he took the degree of M.D., he joined the army medical service and was stationed at the Cape of Good Hope in 1817. About a year later he went to Canada as medical officer to a regiment, and having developed much interest in geology he was commissioned in 1819 to report on the geology of Upper Canada. In 1822 he was appointed British secretary and medical officer to the Boundary Commission, and for several years he made extensive and important geological researches, contributing papers to the American Journal of Science and other scientific journals; and later embodying an account of his travels in a book entitled The Shoe and Canoe (1850). Returning to England in 1837 he practised medicine at Newark until 1846 when he removed to London, where he remained until the end of his life. He now took an active interest in the Geological Society of London, of which he had been elected a fellow in 1853. In 1869 he was elected a fellow of the Royal Society, and in 1874 he was awarded the Murchison medal by the council of the Geological Society. During the last twenty years of his long life he was continually at work preparing, after the most painstaking research, tabulated lists of the fossils of the Palaeozoic rocks. His Thesaurus Siluricus was published with the aid of the Royal Society's Grant, and was later revised and completed by C. H. Seward in 1882. In 1871 he founded the Bigsby medal to be awarded by the Geological Society of London, with the stipulation that the receiver should not be more than forty-five years old. He died in London on the 19th of February 1881.

BIHARI (properly Bihārī), the name of the most western of the four forms of speech which comprise the Eastern Group of modern Indo-Aryan Languages (q.v.). The other members are Bengali, Oriya and Assamese (see Bengali). The number of speakers of Bihari in 1901 was 34,579,844 in British India, out of a total of 90,242,167 for the whole group. It is also the language of the inhabitants of the neighbouring Tarai districts of Nepal. In the present article it is thought that the reader is in possession of the facts described under the heads of Indo-Aryan Languages and Prakrit. The article Bengali may also be studied with advantage.

"Bihārī" means the language of the province of "Bihār," and to a certain extent this is a true description. It is the direct descendant of the old Magadhi Prakrit (see Prakrit), of which the headquarters were South Bihar, or the present districts of Gaya and Aurangabad. It has never extended beyond the limits of this province. To the west it extends over the province of Agra so far as the longitude of Benares, and to the south it covers nearly the whole of the province of Chota Nagpur. Allowing for the speakers in Nepal, its area extends over about 90,000 sq. m., and the total number of people who claim it as a vernacular is about the same as the population of France. Bihari has been looked upon as a separate language only during the past twenty-five years. Before that it was grouped with all the other languages spoken between Bengal and the Punjab, under the general term "Hindi." The usual character employed for writing Bihari is that known as Kāthi, a cursive form of the well-known Nagari character of Upper India. The name of the character is derived from the Kāyath or Kāyasth caste, whose profession is that of scribes. Kaithi is widely spread, under various names, all over northern India, and is the official character of Gujrat. The Nagari character is commonly employed for printed books, while the Brahman of Tirtha have a character of their own, akin to that used for writing Bengali and Assamese. In the south of the Bihari tracts in the Oriya character belonging to the neighbouring Orissa is also found.

Bihari has to its east Bengali, also a language of the Outer Band. To its west it has Eastern Hindi, a language of the Intermediate Band (see Indo-Aryan Languages). While it must decidedly be classed as an Outer language, it nevertheless shows, as might be expected, some points of contact with the Intermediate ones. Nothing is so characteristic of Bihari as its pronunciation of the vowel a and of the consonant s. The first is sounded like the o in "hot" (transliterated o). In Eastern Bihari the same vowel has a broad sound, but not so broad as in Bengali. As we go westwards this broad sound is gradually reduced till it entirely disappears in the western dialect, Bhojpuri. As regards s, the Magadhi Prakrit pronounced it as s, like the s in "shin." The Prakrits of the West preserved its dental sound, like that of the s in "sin." Here Bengali and Eastern Hindi exactly represent the ancient state of affairs. The former has the 3-sound and the latter the s-sound. At the present day Bihari has abandoned the practice of the old Magadhi Prakrit in this respect, and pronounces its s's as clearly as in the West. There are political reasons for this. The pronunciation of s is a literal shibboleth between Bengali and Upper India. For centuries Bihari has been connected politically with the West, and has in the course of generations rid itself of the typical pronunciation of the East. On the other hand, a witness as to the former pronunciation of the letter is present in the fact that, in the Kaithi character, s is always written ṣ. In the declension of nouns, Bihari follows Bengali more closely than it follows Eastern Hindi, and its conjugation is based on the same principles as those which obtain in the former language.

The age of Bihari as an independent language is unknown. We have songs written in it dating from the 15th century, and at that time it had received considerable, though not a complete, development. It is consequently divided into two divisions, an eastern and a western. The eastern division includes Maithili or Tirkutia and Magahi. Magahi is the dialect of the country corresponding to the ancient Magadha, and may therefore be taken as the modern representative of the purest Magadhi Prakrit. Its northern boundary is generally the river Ganges, and its western the river Son. To the south it has overflowed into the northern half of Chota Nagpur. It is nearly related to Maithili, but it is quite uncultivated and has no literature, although it is the vernacular of the birthplace of Buddhism. Nowadays it is often referred to by natives of other parts of the country as the typically boorish language of India. Maithili faces Magahi across the Ganges. It is the dialect of the old country of Mithila or Tirkut, famous from ancient times for its learning. Historically and politically it has long been closely connected with Oudh, the home of the hero Râma-candra, and its people are amongst the most conservative in India. Their language bears the national stamp. It has retained numerous antiquated forms, and parts of its grammar are extraneous to modern tongues. It has lost much of its punch, and is helped to preserve these peculiarities in full play, so that though Magahi shares them, it has lost many which are still extant in the everyday talk of Mithila. The western division consists of the Bhojpur dialect, spoken on both sides of the Gangetic valley, from near Patna to Benares. It has extended south-east into the southern half of Chota Nagpur, and is spoken by at least twenty millions of people who are as free from prejudice as the inhabitants of Mithila are conservative. The Bhojuris are a fighting race, and their language is a practical one, made for everyday use, as simple and straightforward as Maithili and Magahi are complex. In fact, it might almost be classed as a separate language, had it any literature worthy of the name.

The accent on the penultimate, owing to the following imperfect vowel (see below). When the first syllable of a word has not the main stress-accent, it also takes a secondary one, as in देवगृहरे-निष्ठावान्ति।

When the letter a follows a syllable which has the accent (secondary accent) as in देवगृहरे-निष्ठावान्ति, the vowel which is sometimes pronounced with a drawl, like an English "ball," and is then transiterated a. When a has this sound it can end a word, and in this position is common in the second person of verbs; thus, देवगृहरे, see thou. This sound is very frequently heard in Bihari, where it is denoted by a small a in the writing. The large a is因而
denoted by a small a above the line. In Mth., but not in Mgh. or Bh., a final short i or u is often similarly very lightly pronounced, and is then represented by the same device. Before such an "imper-
fect" vowel, the syllable has a secondary accent, if it has not already got the main one.

When a word ends in a preceding by a single unaccompanied consonant, the a is not pronounced; thus, kisana, sounded kisana. This vowel is sometimes pronounced with a drawl, like an English "ball," and is then transiterated a. When a has this sound it can end a word, and in this position is common in the second person of verbs; thus, देवगृहरे, see thou. This sound is very frequently heard in Bihari, where it is denoted by a small a in the writing. The large a is因而
denoted by a small a above the line. In Mth., but not in Mgh. or Bh., a final short i or u is often similarly very lightly pronounced, and is then represented by the same device. Before such an "imper-
fect" vowel, the syllable has a secondary accent, if it has not already got the main one.

Thus, when it is confused with the short vowel, the syllable is pronounced with a short vowel, and is then transcribed a. Thus, देवगृहरे, see thou. This sound is very frequently heard in Bihari, where it is denoted by a small a in the writing. The large a is因而
denoted by a small a above the line. In Mth., but not in Mgh. or Bh., a final short i or u is often similarly very lightly pronounced, and is then represented by the same device. Before such an "imper-
fect" vowel, the syllable has a secondary accent, if it has not already got the main one.

Thus, when it is confused with the short vowel, the syllable is pronounced with a short vowel, and is then transcribed a. Thus, देवगृहरे, see thou. This sound is very frequently heard in Bihari, where it is denoted by a small a in the writing. The large a is因而
denoted by a small a above the line. In Mth., but not in Mgh. or Bh., a final short i or u is often similarly very lightly pronounced, and is then represented by the same device. Before such an "imper-
fect" vowel, the syllable has a secondary accent, if it has not already got the main one.

Thus, when it is confused with the short vowel, the syllable is pronounced with a short vowel, and is then transcribed a. Thus, देवगृहरे, see thou. This sound is very frequently heard in Bihari, where it is denoted by a small a in the writing. The large a is因而
denoted by a small a above the line. In Mth., but not in Mgh. or Bh., a final short i or u is often similarly very lightly pronounced, and is then represented by the same device. Before such an "imper-
fect" vowel, the syllable has a secondary accent, if it has not already got the main one.

Thus, when it is confused with the short vowel, the syllable is pronounced with a short vowel, and is then transcribed a. Thus, देवगृहरे, see thou. This sound is very frequently heard in Bihari, where it is denoted by a small a in the writing. The large a is因而
denoted by a small a above the line. In Mth., but not in Mgh. or Bh., a final short i or u is often similarly very lightly pronounced, and is then represented by the same device. Before such an "imper-
fect" vowel, the syllable has a secondary accent, if it has not already got the main one.

fect" vowel, the syllable has a secondary accent, if it has not already got the main one.
In Mth. all the forms in which the object is honorific end in non-: Mg. closely follows this, but the forms are more abraded.

Forms in which the object is non-honorific may be, as in the case of nouns, short, long, or superlative. The long forms are made by adding $k$ (or in the second person $-a$) to the short forms, and the redundant forms by adding $k$ to the long forms. Again, if the object is in the second person, the $a$ of the long and redundant forms is changed to $e$. Finally, in first person the non-honorific forms depending on the subject are the same, and are identical with those forms of the second person in which the subject is honorific. Thus we get the following paradigm of the Mth. past tense of the verb marāb, to strike. The Mg. forms are a little different. Beside the above there are numerous optional forms. Moreover, these are only masculine forms. The feminine gender of the subject introduces new complications. It is impossible here to go into all these minutiae, interesting as they are to philologists. They must be learnt from the regular grammars. On the present occasion we shall confine ourselves to describing the formation of the principal parts of the verb.

In Mth. the usual verb substantive and auxiliary verb is, as in Bengali, based on the root ach (Skr. prachi), the initial vowel being generally dropped, as in ch, I am; chāhā, I was; ach, he is. In Mg. we have ha or hē, I am; ha, I was. The finite verb has three verbal roots or infinitives, viz. (from the root mār, strike), mār or mārā; mārāh, and mārala, respectively. There are two participles, a present (Mth. mārā = Pr. mārānta) and a past (Mth. mārala = Pr. mārala-). The Mth. future is a mixed tense. Generally speaking, the first two persons are formed from the verbal root in b, which is by origin a future passive participle, and the third person is formed from the present participle. Thus, mārala $+$ b, about-to-be-struck $+$ by-me, becomes mārala, I shall strike. Also, mārāh $+$ b, striking $+$ he, becomes mārāh, he will strike (compare the English “he’s going,” for “he is on the point of going”). A past conditional is also formed by adding similar suffixes to the present participle, as in mārala $+$ b $+$ d, if I had struck. This use of the present participle already existed in the Pr. age (cf. Hema-candra’s Grammar, iii. 180). In Mth. the present definite and the imperfect are formed by conjugating the present or past tense respectively of the auxiliary verb with the present participle; thus mārāt ēd, I am striking.

Mg. (like vulgar ād (Skr. āpaya, Pr. āvā)) compound verbs are numerous. Noteworthy is the desiderative compound formed by adding the root cāh, wish, to the dative of a verbal noun. Thus, ham dékha-k cāhāt-chā, I wish to see, to wish for the seeing, wish to strike.

**Conjugation in Bhojpuri.**—The Bh. conjugation is as simple as that of Mth. and Mg. is complex. In the first and second persons the plural is generally employed for the singular, but there is no change in the verb corresponding to person or honour of the object. The usual verb substantive and auxiliary verb is derived in the present from the root bāt or bē, be, in bā or bē (Skr. varatā, Pr. tāfā), he is. The past is derived from the root rah (Skr. rahāti, Pr. rahā, as in rahil or (contracted) rohī, I was. The verbal nouns and participles are nearly the same as in Mth.-Mg., the first verbal noun and the present participle being mār, as in Mg. The present and imperative, derived from the Mg. pr. forms, are also employed in Bh. Thus, mārē (Pr. mārē), he strikes. This tense is often used as a present conditional. When it is wished to emphasize the sense of a present indicative, the syllable -ā is suffixed. The same suffix is employed in Rajasthani, Naiapāl, and Marathi to form the future, and in Bh. it is often also used with a future sense. The past tense is formed, as in Mg., by adding pronominal suffixes to the past participle; thus, mārā (mārā + ə), I struck, as explained above. Similarly, for the first and second persons of the future we have mārā ə, I shall strike, and so on. The third person is mārē (Pr. mārēhē), he will strike, mārēni (Pr. mārēnihē), they will strike. The periphrastic tenses are formed on the same principles as in Mth. As an example of Bh. conjugation we give the present, past and future tenses in all persons. There are a few additional forms, but nothing like the multiplicity of meanings which we find in Mth. and Mg.

It will be observed that the termination of the present changes in sympathy with the old present to which it is attached. In some parts of the Bh. area, especially in the district of Sāran, a is substituted for ō in the past. Thus, mārē, I struck. The mārē is merely the past participle without the pleonastic termination -āwhich is used in Bhari, as explained under the Mth.-Mg. conjugation. Irregular verbs, the formation of transitive and causative verbs, and the treatment of compound verbs, are on the same lines as in Mth. and Mg. The form mārēhē replaces the default form mārē.
BIHĀRĪ-LĀL—BIJAPUR

Bihāri Literature.—In all three dialects there are numerous folk-epics transmitted by word of mouth. Several have been published at various times in the Journal of the Asiatic Society of Bengal and in the Zeitschrift der deutschen morgenländischen Gesellschaft. The only dialect which has any real literature is Maithili. The earliest writer of whom we have any definite account is Vidyapati, an astrologer and musician who lived at the court of Rājā Śiva Siśuha of Sugaona in Tiharut in the 15th century. He was a voluminous Sanskrit writer, but his fame rests chiefly on his dainty lyrics in Maithili dealing with the loves of Rādhā and Krishna. These have exercised an important influence on the religious history of eastern India. They were adopted and enthusiastically recited by the reformer Caitanya (16th century), and through him became the home-poetry of the Bengali-speaking Lower Provinces. Their language was transformed (we can hardly say translated) into Bengali, and in that shape they have had numerous imitators. A collection of poems by the old Master-singer in their Maithili dress has been published by the present writer in his Chrestomathy of that language. The most admired of Vidyapati’s successors is Manbodh Jhā, who died in 1788. He composed a Haribāna, or poetical life of Krishna, which has great popularity. Many dramas have been written in this dialect, and to write the body of the work in Sanskrit and Prakrit, but the songs in Maithili. Two dramas, the Pārijātā-harana and the Rukmimati-paraniraya, are attributed to Vidyapati. Among modern writers in the dialect, we may mention Harṣanāthā, an elegant lyric poet and author of a drama entitled Uṣā-harana, and Candrā Jhā, whose version of the Rāmāyaṇa and translation of Vidyapati’s Sanskrit Purāṇa-parājāya are deservedly popular.

No special works have been written about Magāhi. (G. A. G.)

BIHĀRĪ-LĀL, a name famous in Hindustani literature as the author of the Sat-sā, a collection of approximately seven hundred distichs, which is perhaps the most celebrated Hindi work of poetic art, as distinguished from narrative and popular styles of the speech of Hindi called Brāj-bhāsā, spoken in the country about Mathura, where the poet lived. The couplets are inspired by the Krishna side of Vishnu-worship, and the majority of them take the shape of amorous utterances of Rādhā, the chief of the Gopīs or cowherd maidens of Brāj, and her divine lover, the son of Vasudeva. Each couplet is independent and complete in itself, and is a triumph of skill in compression of language, felicity of description and rhetorical artifice. The distichs, in their collected form, are arranged, not in any sequence of narrative or dialogue, but according to the technical classification of the sentiments which they convey as set forth in the treatises on Indian rhetoric. Little is known of the author beyond what he himself tells us. He was born in Gwālīr, spent his boyhood in Bundelkhand, and on his marriage settled in his father-in-law’s household in Mathurā. His father was named Kesāb Rāy; he was a twice-born (Dvija) by caste, which is generally understood to mean that he was a Brāhman, though some assert that he belonged to the mixed caste, now called Rāy, sprung from the offsprings of Brahmā by a Kṣatriya mother. A couplet in the Sat-sā states that it was completed in A.D. 1662. It is certain that his patron, whom he calls Jai Shāh, was the Rājā of Ambār or Jaipur, known as Mirzā Jai Singh, who ruled from 1617 to 1667 during the reigns of the emperors Jahāngīr, Shah Jahan and Aurangzeb. A couplet (No. 750) appears to refer to an event which occurred in 1665, and in which Rājā Jai Singh was concerned. For this prince the couplets were composed, and for each dōhā the poet is said to have received a gold piece worth sixteen rupees.

The collection very soon became celebrated. As the couplets are independent one of another, and were put together fortuitously as composed, many different recensions exist; but the standard is that settled by an assembly of poets under the direction of Prince A’zām Shāh, the third son of the emperor Aurangzeb (1653–1707), and hence called the A’zām-shāhī; it comprises 716 couplets. The estimation in which the work is held, and the number of copies, have been such that many writers have devoted themselves to its elucidation, of whom Dr Grierson mentions seventeen. Two of them were Musalmāns, and two other commentators were composed for Musalmān patrons. The collection has also twice been translated into Sanskrit.

The best-known commentary is that of Lālā-ji-Lāl, entitled the Lālā-chandrikā. The author was employed by Dr Gillibrand in the College of Fort William, when he finished his commentary in 1818. A critical edition of it has been published by Dr G. A. Grierson (Calcutta, government of India Press, 1896). (C. J. L.)

BIJAPUR, an ancient city and modern district of British India in the southern division of Bombay. It is a station on the Southern Maharatta railway, 60 m. S. of Sholapur. The ancient city was supplied with water by an elaborate underground system of reservoirs and aqueducts, which has been restored in part as a famine relief work. The population in 1901 was 23,811. The city used to be the extensive, splendid and opulent capital of an independent sovereignty of the same name, but now retains only the vestiges of its former grandeur. It is still, however, the most picturesque collection of ruins in India. The city of Bijapur owed its greatness to Yusuf Adil Shah, the ruler of Bijapur from 1537 to 1608. It consists of three distinct portions—the citadel, the fort and the remains of the city. The citadel, built by Yusuf Adil Shah, a mile in circuit, is of great strength, well built of the most massive materials, and encompassed by a ditch 100 yds. wide, formerly supplied with water, but now nearly filled up with rubbish, so that its original depth cannot be discovered. Within the citadel are the remains of Hindu temples, which prove that Bijapur was an important town in pre-Mahomedan times. The fort, which was completed by Ali Adil Shah in 1566, is surrounded by a wall 6 m. in circumference. This wall is from 30 to 50 ft. high, and is strengthened with ninety-six massive bastions of various designs. In addition there are ten others at the various gateways. The width is about 25 ft.; from bastion to bastion runs a battlemented curtain wall about 10 ft. high. The whole is surrounded by a deep moat 30 to 40 ft. broad. Inside these walls are the remains of a vast city, now for the most part in ruins, but the innumerable tombs, mosques, caravanserais and other edifices, which have resisted the havoc of time, afford abundant evidence of the ancient splendour of the place. Among its many buildings three are specially worthy of mention. The Gol Guvbaz, or tomb of Sultan Mahommed Adil Shah, which was built 1626–1656, is one of the most interesting buildings in the world. It is a square building, 135 ft. each way, which is surrounded by a great circular dome 198 ft. high. The inside area (1,860 ft.) is greater than the Pantheon at Rome (1,583 sq. ft.). When first built the dome was covered by gold leaf, and the outer walls were adorned with stucco work picked out in gold and blue, but to-day there are very few traces of this
BIJAWAR—BIJNOR

ornamentation. Of late years this mosque has been thoroughly restored, and one portion is now used as a museum in which all objects of interest discovered in the surrounding country are exhibited. Next to this comes the Ibrahim Roza, or tomb and mosque of Ibrahim Adil Shah II., which was completed about 1585 and is supposed to be one of the most exquisite buildings in the world after the Taj at Agra. It is said to have cost £1,700,000 and to have occupied thirty-six years in its construction. The Gagan Malal, or ancient audience hall, is now a mass of ruins, but when complete must have been a beautiful building. The archway remains. It is over 60 ft. span and about 90 ft. high. Through this arch Sikandar Adil Shah, the last king of Bijapur, was brought bound with silver chains, while on a raised platform sat Aurangzeb, the Mogul emperor, who had left Delhi three years previously to conquer the Deccan. This magnificent palace, where so many scenes historic in the Bijapur dynasty occurred, is now the abode of hundreds of pigeons. Their cooing is the only sound that breaks the silence of the old halls.

History.—The founder of the Bijapur dynasty, Yusuf Adil Shah, is said by Ferishta to have been a son of the Ottoman sultan Murad II. When on his accession Mahommed II. gave orders for the strangling of all his brothers, Yusuf was saved by a stratagem of his mother. He went to India, where he took service under the Bahmanii king of the Deccan, and ultimately became a person of great importance at the court of Mahomud II. In 1489 he took advantage of the break-up of the Bahmanii power to establish himself as an independent sultan at Bijapur, his dominions including Goa on the west coast. He died in 1511 (Goa had been taken by the Portuguese a few months before), and was succeeded by his son Ismail, who reigned prosperously till 1534. The next king worth mentioning is Ali Adil Shah I., who reigned from 1557 to 1570 and, besides the fort, built the Jam Masjid or great mosque, the aqueducts and other notable works in the city. His son Ibrahim (d. 1626) maintained the prosperity of the state; but under his successor, Mahommed Adil Shah (d. 1656), the rise of the Mahratta power under Shivaji began to make inroads upon it, and it was exposed to the very formidable ambition of Shah Jahan. On the death of Mahommed the succession passed to Ali Adil Shah II., and on his death in 1672 to his infant son, Sikandar Adil Shah, the last of the race. The kingdom had been for some time rapidly falling to ruin, and in 1686 the Mogul emperor Aurangzeb, who as Shah Jahan’s general had unsuccessfully besieged the city under Mahommed Adil Shah, took Bijapur and annexed it to the Delhi empire. Among the curiosities of the capital is the cornucopia or treasure urn (Malik-i-Maidan), stated to be the largest piece of cast bronze ordinance in the world. It was captured from the king of Ahmednagar by the king of Bijapur about the middle of the 15th century. An inscription on the gun recording that fact was erased by Aurangzeb, who substituted the present inscription stating that he conquered Bijapur in 1686. The city and territory of Bijapur remained annexed to Delhi till 1724, when the nizam established his independence in the Deccan, and included Bijapur within his dominions. His sway over this portion of his acquisitions, however, was of brief duration; for, being defeated by the Peshwa in 1760, he was compelled to purchase peace by his cession to the Mahrattas. Upon the fall of the Peshwa in 1818 Bijapur passed into the hands of the British, and was by them included in the territory assigned to the raja of Satara. In 1848 the territory of Satara was eschewed through the failure of heirs. The city was made the administrative headquarters of the district in 1885.

The district of Bijapur, formerly called Kaladgi, occupies a barren plain, sloping eastward from a series of undulating Mahratta states to the nizam’s dominions. It contains an area of 2,700 sq. m., and its population in 1901 was 735,435, showing a decrease of 8% compared with an increase of 27% in the preceding decade, and a decrease of 21% in the period between 1872 and 1881. These changes in population reveal the effects of famine, which was very severely felt in 1876-1878 and again in 1899-1900. There is very little irrigation in the district. The principal crops are millet, wheat, pulse, oil-seeds and cotton. There are considerable manufactures of cotton and silk goods and blankets, and several factories for ginning and pressing cotton. The East Deccan line of the Southern Mahratta railway traverses the district from north to south.

BIJAWAR, a native state of central India, in the Bundelkhand agency. Area, 973 sq. m.; pop. (1901) 110,500; revenue, £520,000. Forests cover nearly half the total area of the state, which is believed to be rich in minerals, but lack of transport facilities has hindered the development of its resources.

The state takes its name from the chief town, Bijawar (pop. in 1901, 2200), which was founded by Bijai Singh, one of the Gond chiefs of Garha Mandla, in the 17th century. It was conquered in the 18th century by Chhatarsal, the founder of Panna, a Rajput of the Bundela clan, by whose descendants it is still held. It was confirmed to Ratan Singh in 1811 by the British government for the usual deed of allegiance. In 1837 Bhan Pratap Singh rendered signal services to the British during the Mutiny, being rewarded with certain privileges and a hereditary salute of eleven guns. In 1866 he received the title of maharaja, and the prefix sahib in 1877. Bhan Pratap was succeeded on his death in 1899 by his adopted son, Sanwant Singh, a son of the maharaja of Orchha.

Bijnor, or Bijnor, a town and district of British India in the Bareilly division of the United Provinces. The town is about 3 m. from the left bank of the Ganges. The population in 1901 was 77,583. There is a large trade in sugar. The American Methodists have a mission, which maintains some aided schools, and there is an English high school for boys.

The district of Bijnor has an area of 1701 sq. m. The aspect of the country is generally a level plain, but the northern part of it rises towards the Himalayas, the greatest elevation being 1342 ft. above the sea-level. The Koh and Ramganga are the principal rivers that flow through the district, and the Ganges forms its western boundary. In 1901 the population was 779,451, showing a decrease of 2% in the decade. The country is watered in most parts by streams from the hills, but a series of small canals has been constructed. Sugar is largely exported. A line of the Oudh & Rohilkhand railway from Moradabad to Saharanpur runs through the district.

History.—Of the early history of Bijnor even after it passed under Mahomedan rule little is known with any certainty. The district was ravaged by Tumir in 1399, and thenceforward nothing is heard of it till the time of Akbar, when it formed part of the Mughal empire and so continued undisturbed, save for occasional raids, so long as the power of the Moguls survived intact. In the early part of the 18th century, however, the Rohilla Pathans established their independence in the country called by them Rohilkhand; and about 1748 the Rohilla chief Ali Mahommed made his first annexations in Bijnor, the rest of which soon fell under the Rohilla domination. The northern districts were granted by Ali Mahommed to Najib Khan, who gradually extended his influence west of the Ganges and at Delhi, receiving the title of Najib-ud-daula and becoming paymaster of the royal forces. His success, however, raised up powerful enemies against him, and at their instigation the Mahrattas invaded Bijnor. This was the beginning of a feud which continued for years. Najib, indeed, held his own, and for the part played by him in the victory of Panipat was made vizier of the empire. After his death in 1770, however, his son Zabita Khan was defeated by the Mahrattas, who overran all Rohilkhand. In 1772 the nawab of Oudh made a treaty with the Rohillas, convenanting to expel the Mahrattas in return for a money payment. He carried out his part of the bargain; but the Rohilla chiefrefused to pay. In 1774 the nawab concluded with the government of Calcutta a treaty of alliance, and he now called upon the British, in accordance with its terms, to supply a brigade to assist him in enforcing his claims against the Rohillas. This was done; the Rohillas were driven beyond the Ganges, and Bijnor was incorporated in the territories of the nawab, who in 1801 ceded it to the East India Company. From this time the history of Bijnor is uneventful, until the Mutiny of 1857, when
(on the 1st of June) it was occupied by the nawab of Najibabad, a grandson of Zabita Khan. In spite of fighting between the Hindus and the Mahomedan Pathans the nawab succeeded in maintaining his position until the 21st of April 1858, when he was defeated by the British at Nagina; whereupon British authority was restored.

BIKANIR, a native state of India, in the Rajputana agency, with an area of 23,311 sq. m. The natural aspect of the country is one desolate tract, without a single permanently running stream. Its surface is overgrown with undulating sand-hills, of from 20 to 100 ft. above the average level, and so loose that men and quadrupeds stepping off the beaten track sink as if in snow. Two streams, the Katli and Ghaggart, attempt to flow through this dismal region, but are lost in its sands. Water is very scarce, and is raised from wells of from 250 to 340 ft. in depth. A few shallow salt lakes are filled by rain water, but they dry up on the setting in of the hot weather, leaving a thick crust of salt on their beds, which is used for commercial and domestic purposes. The inhabitants are very poor. They live chiefly by pasturage—rear ing, of which their chief agricultural stock consists, and horses of a fine breed, which fetch good prices. They also manufacture every article of native dress and good blankets. The other industries are leather work, sugar-refining, goldsmith's work, ivory carving, iron, brass, copper, stone masonry, tanning, weaving, dyeing and carpentry. The principal towns are Bikanir, the capital, Churu, Rajgarh, Ratangarh and Reni. In 1901 the population was 58,627, showing a decrease of 30% due to the results of famine. The revenue is £414,000. The military force consists of 500 men, besides the Imperial Service Corps of the same strength. The schools include a high school affiliated to the university of Allahabad, a school for the sons of nobles, and a girls' school called after Lady Elgin. The railway from Jodhpur has been extended towards Bhantinda in the Punjab; on the northern border, the Ghaggart canal in the Punjab irrigates about 3000 acres. Drought is of common occurrence. The famine of 1899-1900 was severely felt. The city of Bikanir has a railway station. The city is surrounded by a stone wall, 6 ft. thick, 15 to 30 ft. high and 3½ m. in circuit, with five gates and three sally-ports. The citadel is a half mile northeast of the city, and is surrounded by a rampart with bastions. The population in 1901 was 53,075. There are manufactures of fine blankets and sugar-candy.

History.—In the 15th century the territory which now forms the state was occupied by Rajput clans, partly Jats, partly Mahommedans. About 1452 Bika, a Rathi Rajput, sixth son of Rao Jodha, chief of Marwar, started out to conquer the country. By taking advantage of the rivalries of the clans he succeeded; in 1485 he built the small fort at the capital which still bears his name, and in 1488 began the building of the city itself. He died in 1504, and his successors gradually extended their possessions. In the reign of Akbar the chiefs of Bikanir were esteemed among the most loyal adherents of the Delhi empire, and in 1570 Akbar married a daughter of Kalyan Singh. Kalyan's son, Rai Singh, who succeeded him in 1571, was one of Akbar's most distinguished generals and the first raja of Bikaner; his daughter married Sella, afterwards the emperor Jahangir. Two other distinguished chiefs of the house were Karan Singh (1631-1669), who in the struggle of the sons of Shah Jahan for the throne threw his lot in with Aurangzeb, and his eldest son, Anup Singh (1669-1698), who fought with distinction in the Deccan, was conspicuous in the capture of Golconda, and earned the title of maharaja. From this time forward the history of Bikanir was mainly that of the wars with Jodhpur, which raged intermittently throughout the 18th century. In 1802, during one of these wars, Elphinstone passed through Bikanir on his way to Kabul; and the maharaja, Surat Singh (1788-1828), applied to him for British protection, which was, however, refused. In 1815 Surat Singh's tyranny led to a general rising of his Zabita, and in 1816 the maharaja again applied for British protection. On the 9th of May 1818 a treaty was concluded, and order was restored in the country by British troops. Ratan Singh, who succeeded his father in 1828, applied in vain in 1830 for the British government for aid against a fresh outbreak of his subjects; but during the next five years dacoity became so rife on the borders that the government raised a special force to deal with it (the Shakhawati Brigade), and of this for seven years Bikanir contributed part of the cost. Henceforth the relations of the maharajas with the British government were increasingly cordial. In 1842 Ratan Singh supplied camels for the Afghan expedition; in 1844 he reduced the dues on goods passing through his country, and he gave assistance in both Sikh campaigns. His son, Sardar Singh (1851-1872), was rewarded for help given during the Mutiny by an increase of territory. In 1868 a rising of the subjects against his extortions led to the despatch of a British political officer, by whom affairs were adjusted. Sardar Singh had no son, and on his death in 1872 his widow and principal ministers selected Dungar Singh as his successor, with the approval of the British government. The principal event of his reign was the rebellion of the subjects in 1883, owing to an attempt to increase the dues payable in lieu of military service; this led to the permanent location at Bikanir of a British political agent. Dungar Singh died in 1896 and was succeeded by his brother, Ganga Singh (b. 1880), who succeeded as 21st chief of Bikanir with the approval of the government. He was educated at the Mayo College at Ajmere, and was invested with full powers in 1898. He attended King Edward's coronation in 1902, and accompanied the British army in person in the Chinese campaign of 1901 in command of the Bikanir Camel Corps, which also did good service in Somaliland in 1904. The state owes to this ruler the opening up of new railways across the great desert, which was formerly passable only by camels, and the tapping of the valuable coal deposits that occur in the territory. For his conspicuous services he was given the Kaisar-i-Hind medal of the first class, made an honorary major in the Indian army, a G.C.I.E., a K.C.S.I., and A.D.C. to the prince of Wales.

BILASPUR, a town and district of British India in the Chhattisgarh division of the Central Provinces. The town is situated on the right bank of the river Arpa. It is said to have been founded by a fisherwoman named Bilasa in the 17th century, and it still retains her name. The place, however, came into note only after 1741, the year of the Mahratta invasion (see below), when a Mahratta official took up his abode there and began to build a fort which was never completed. In 1862 it was made the headquarters of the district. The population in 1901 was 18,937. It is an important junction on the Bengal-Nagpur railway, where the two lines from the west meet on their way to Calcutta, 255 m. from Nagpur.

The District of Bilaspur has an area of 7602 sq. m. It forms the upper half of the basin of the river Mahanadi. It is almost enclosed on the north, west and east by ranges of hills, while its southern boundary is generally open and accessible, well cultivated, and closely dotted with villages embedded in groups of fruit trees. The principal hills are—(1) the Maikal range, situated in the north-western extremity of the district; (2) a chain of hills forming part of the Vindhyan range, on the north; (3) the Korba hills, an offshoot of the Vindhyas, on the eastern boundary; and (4) the Sonakhan block of hills, in the south-east, forming the Mahanadi river. The Mahanadi is the principal river of the district, and governs the whole drainage and river system of the surrounding country. It takes its rise in a mountainous region which is described as the wildest of all wild parts of the Central Provinces, crosses the Bilaspur boundary near Seorainar, and after a course of 25 m. in the south-eastern extremity of the district enters Sambalpur district. Within Bilaspur the river is everywhere navigable for six months in the year. Minor rivers are the Sakri, Hamp, Tesa, Agar, Maniari, Arpa, Kharad, Lilagar, Jonk and Bareri. The most important affluents of the Mahanadi are the Seonath and Hasdu. Besides the natural water supply afforded by the rivers, Bilaspur abounds in tanks. There are large forest areas, those belonging to the government covering over 600 sq. m. Sal (Shorea robusta) is the chief timber tree.
BILBAO

Bilaspur, which was formerly a very isolated tract, is now traversed in three directions by lines of the Bengal-Nagpur Railway. It suffered severely from the famine of 1896–1897. In 1897 the general death-rate was as high as 90 per thousand, rising to 297 in Bilaspur town. It suffered no less severely in 1900, when in May the number of persons relieved rose to one-fourth of the total population.

In 1901 the population was 1,012,972, showing a decrease of 13% compared with an increase of 14% in the preceding decade. In 1906, however, the new district of Drug was formed, which took away 730 sq. m. from Bilaspur; the population on this reduced area of Bilaspur in 1901 was 917,240.

Among the Hindu inhabitants of the district, the Chamaras and Pankas deserve particular notice. The former, who form the shoemaker and leather-dealing caste of the Hindu community, had always been held in utter contempt by the other Hindu castes. But between 1830 and 1830 a religious movement, having for its object their freedom from the trammels of caste, was inaugurated by a member of the caste, named Ghasi Das, who preached the unity of God and the equality of men. Ghasi Das gave himself out as a messenger of God; he prohibited the additional burdens, and enjoined the worship of the Supreme Being without any ceremonies. Their ethical and religious views, the new faith called themselves Satnamis, or the worshippers of Satnam or God. They do not keep the Hindu festivals and they defy the contempt of the Brahmans. Ghasi Das, the founder of the faith, was their first high priest. He died in 1830; his son succeeded him, but was assassinated (it was said by the Hindus), and the grandson succeeded him. The Pankas, who form about a sixth of the population, are all Kabirpanthis, or followers of Kabir, a religious reformer of the 15th century. There is no great difference between the Kabir Pankas and the Satnamis. They both abstain from meat and liquor, marry at the age of puberty, ordinarily celebrate their ceremonies through the agency of the elders of their own caste and bury their dead. The Pankas worship the Supreme Being under the name of Kabir, and the Chamaras under the name of Satnam; while each community has a high priest to whom reverence is paid. At present the majority of the Pankas are cultivators, though formerly all were weavers. The Gonds are the most numerous among the aboriginal tribes, but so great an increase of population has taken place between them and the Hindu races that they have lost their language and most of their peculiar characteristics, such as the flat forehead, squat nose, prominent nostril, dark skin, &c., and are scarcely distinguishable from the other classes of the Hindu labouring population. In addition to some of the Hindu deities which they worship, the Gonds have their own gods—Bara Deva and Dula Deva. The Kanwaras are the next largest section of the aboriginal population. The upper class among them claim to be Rajputs, and are divided into numerous septs. Although an aboriginal tribe, the census returns them as a Hindu caste. All the northern landlords of Bilaspur belong to this tribe, which consequently occupies an influential position.

The chief wealth of the district consists in its agricultural produce. Rice, wheat, pulses, millet, mustard, oil-seeds and cotton are the chief crops. Rice, the chief export, is sent to Bombay, Berar and northern India. The tussur silk industry is of considerable importance, and the silk is reputed the best in the Central Provinces. Sal and other timber is exported. Lac is sold in large quantities in Calcutta and Mirzapur. Coal and iron are the chief minerals; sandstone for building purposes is quarried near Bilaspur and Seorinarain. Among local industries the most important is the weaving trade.

The early history of the district is very obscure. From remote ages it was governed by kings of the Haihai dynasty of Ratanpur and Raipur, known as the Chhattisgarah rajas, on account of thirty-six forts (garkis), of which they were the lords. A genealogical list of kings of this dynasty was carefully kept up to the fifty-fifth representative in the year 1741, when the country was seized without a struggle by the Maharrats of Nagpur. From 1818 to 1830 Bilaspur came under the management of the British government, the Maharatta chief of Nagpur being then a minor. In 1854 the country finally lapsed to the British government, the chief having died without issue. During the Sepoy mutiny a hill chief of the district gave some trouble, but he was speedily captured and executed.

BILBAO, formerly sometimes written Bilbaia, the capital of the province of Biscay, in northern Spain; in 43° 15' N. and 2° 45' W.; on the river Nervion on Ansa (in Basque Ibaizabal), and about 8 m. inland from the Bay of Biscay. Pop. (1900) 83,306. Bilbao is one of the principal seaports of Spain, and the greatest of Basque towns. It occupies a small but fertile and beautiful valley, shot in by mountains on every side except towards the sea, and containing the fortified haven of Portugalete, the industrial town of Baracaldo (q.v.), and the villages of Santurce and Las Arenas, where the Nervion broadens to form the Bay of Bilbao at its mouth. Bilbao comprises two distinct parts, ancient and modern. The new town lies on the left bank, while the old town rises on the right in terraces. Communication across the river is afforded by five bridges, of which the oldest, San Antonio, is of stone, and dates from the 14th century. The houses in the principal streets are built of sandstone, and have many low mansard roofs, which projecting caves that give shelter from both sun and rain. Most of the streets in the old town are very narrow, and have an appearance of cleanliness and quiet. For a long time no carts or carriages were permitted to enter the city for fear of polluting and injuring the pavement, and the transport of goods was carried on in hand-carts. But after 1876 entirely new districts were mapped out on the left bank of the Nervion. Fine broad streets, splendid squares and public gardens, hotels, villas, palatial new public buildings and numerous schools came into existence. The part of the town on the right bank is, however, still the great centre of business, the narrow streets containing the best shops. There, too, are the banks, the town hall, the theatre, the principal clubs, and the principal churches, including that of Santiago, which dates from the 14th century.

In and around Bilbao there are more than thirty convents and monasteries, and at Olaveaga, a mile off, is the Jesuit university, attended by 8,520 students. Public education is not, however, entirely in the hands of the priesthood and nuns; there are an institute, a normal school to train teachers, a school of arts and handicrafts, a nautical school, and numerous schools, both public and private, for both sexes.

Few Spanish cities grew so rapidly in size, importance and wealth as Bilbao in the latter half of the 19th century. Its first bank was founded in 1857; its first railway (Bilbao-Tudela) opened in 1863. Thenceforward, despite the check it received from the Carlist rebellion of 1870–1876, and the contemporaneous decline of its wool and shipbuilding industries, its prosperity increased steadily. The population, 17,649 in 1870, rose to 70,734 in 1887, 74,076 in 1897, and 83,306 in 1900. This development was due principally to the growth of the mining and metallurgical industries. From a very early period, as the Old English word bilbo, "a sword," attests, Bilbao was celebrated for the excellent quality of its steel blades; in modern times it was the natural headquarters of the important steel and iron trades of the Basque Provinces. Hence it became the centre of a network of railway lines unsurpassed in Spain. The harbour works board, constituted in 1877, improved the river channel and the bar; made wharves and embankments; lighted the lower reaches of the river by electricity, so as to allow vessels to enter by night; and constructed a breakwater and counter-mole across the bar of the river Nervion between Santurtzi and Portugalete and the opposite headland at the village of Algorte, so as to secure deep anchorage and easy access to the river. The first dry dock was constructed in 1896; in 1905 it was supplemented by another, the largest in Spain. The exports are chiefly iron; the imports coal; large quantities of wine from Navarre and the Ebro valley are also sent abroad, and the importation of timber of all kinds from Scandinavia and Finland, and coastwise from Asturias, is of great importance. In the coasting trade the exports are mostly pig-iron, codfish and some products of local industries and agriculture. The shipping
at Bilbao is mainly Spanish, owing to the multitude of small vessels employed in the coasting trade; but from 1880 onwards the majority of foreign ships were British. In 1894, 3,315 vessels of 2,357,547 tons were accommodated at Bilbao; more than 2,000 were Spanish and nearly 700 British. In the same year new harbour works and lighting arrangements were undertaken on a large scale, and a movement was initiated for the revival of shipbuilding. Besides the mining and metallurgical industries, Bilbao has breweries, tanneries, flour mills, glass works, brandy distilleries, and paper, soap, cotton and mosaic factories.

Bilbao, or Bilvao, as it was often called, was founded by Don Pedro Lopez de Haro about 1300, and soon rose into importance. It was occupied by the French in 1705, and from 1808 to 1813; and in 1835 and 1874 it was unavailing appealed by the Carlists.

BILBES, or Belbés, a town of lower Egypt, on the eastern arm of the Nile, 36 m. N.N.E. of Cairo by rail. Pop. (1907) 13,458. The Coptic name, Phelbés, seems to have been derived from Egyptian, but nothing is known of the place before medieval times. Considered the bulwark of the kingdom on that side, Bilbes was by the Moslems defended with strong fortifications. In 1163–1164 it was besieged for three months by the crusaders under Amalric, and in 1168 was captured and pillaged by another army of crusaders. Napoleon in 1798 ordered the restoration of the fortifications, but they have again fallen into decay. It used to be the first halting-place of the English cavalry in their march on Cairo after the fight at Tel-el-Kebir on the 13th of September 1882.

BILBERRY, Bluberry or Whortleberry, known botanically as Vaccinium myrtillus (natural order Ericaceae), a low-growing shrub, found in woods, copses and on heaths, chiefly in hilly districts. The stiff stems, from half a foot to two feet long, bear small oval leaves with a serrate margin, and small, globose, rosy flowers tinged with green. The berries are dark blue, with a waxy bloom, and about one-third of an inch in diameter; they are used for tarts, preserves, &c. The plant is widely distributed throughout the north temperate and extends into the arctic zone. Cowberry is a closely allied species, V. Vitis-Idaea, growing in similar situations, but not found in the south-eastern portion of England, distinguished by its evergreen leaves and red acid berry.

BILBO (from the Spanish term Bilbao, formerly called in English “Bilboa,” and famous, like Toledo, for its sword-blades), in the earliest English use, a sword, especially one of superior temper. In the plural form (as in Shakespeare’s phrase “a thought of I lay worse than the silken snare in after”) it means the weapon with which offenders were equipped on board ship.

BILDERDIJK, WILLEM (1756–1831), Dutch poet, the son of an Amsterdam physician, was born on the 7th of September 1756. When he was six years old an accident to his foot incapacitated him for ten years, and he developed habits of continuous and concentrated study. His parents were ardent partisans of the house of Orange, and Bilderdijk grew up with strong monarchical and Calvinistic convictions. He was, says Da Costa, “anti-revolutionary, anti-Barneveldian, anti-lovevestinsh, anti-liberal.” After studying at Leiden University, he obtained his doctorate in law in 1782, and began to practise as an advocate at the Hague. Three years later he contracted an unhappy marriage with Rebecca Woesthoven. He refused in 1795 to take the oath to the new administration, and was consequently obliged to leave Holland. He went to Hamburg, and then to London, where his great learning procured him consideration. There he had as a pupil Katharina Wilhelmina Schweickhardt (1776–1830), the daughter of a Dutch painter and herself a poet. When he left London in June 1797 for Brussels, this lady followed him, and after he had formally divorced his first wife (1802) they were married. In 1806 he was persuaded by his friends to return to Holland. He was kindly received by Louis Napoleon, who made him his librarian, and a member and eventually president (1809–1811) of the Royal Institute. After the abdication of Louis Napoleon, he suffered great poverty; on the accession of William of Orange in 1813 he hoped to be made a professor, but was disappointed and became a history tutor at Leiden. He continued his vigorous propaganda against liberal ideas to his death, which occurred at Haarlem on the 18th of December 1831.

A picture of the Bilderdijk household is given in the letters (vol. v., 1830) of Robert Southey, who stayed some time with Bilderdijk in 1825. Madame Bilderdijk had translated Roderick into Dutch (1823–1824). For his work as a poet see Dutch Literature. His many-sided activity showed itself also in historical criticism—Geschiedenis des Vaderlands (1832–1835, 13 vols.), a conservative commentary on Wagenaar’s Vaderlandsche Historie; in translations from Sophocles (1770 and 1798), of part of the Iliad, of the hymns and epigrams of Callimachus, and from the Latin poets; in philology—Taal- en Dichtkundige Verscheidenheden (1820–1825, 4 vols.; and in drama—the tragedies, Floris de Vijfde (1808), Willem I. van Holland (1808), and others. His most important poetical works are the didactic poem, De Ziekte der gekoerden (“The Disease of the Learned”), 2 vols., 1807; a descriptive poem in the manner of Dullié in Het buitenleven (1803); and his fragmentary epic, De Ondergang der eerste wereld (1820). Other works were Mijnne Verlussiging (Leiden, 1781), Bloemtjes (1783), Mengel-postzij (1799, 2 vols.), Postzij (1803–1807, 4 vols.), Mengelingen (1804–1808, 4 vols.), Nieuwe Mengelingen (1806, 2 vols.), Hollandsche Historie (1811–1812, 2 vols.), Vaderslande Uitstomingen (Leiden, 1815), Winterbloemen (1811, 2 vols.), &c., in some of which his wife collaborated.

His poetical works were collected by I. da Costa (Haarlem, 1856–1859, 16 vols.), with a biography of the poet. See also “Mijnne Levensbeschrijving” in Mengelingen en Fragmenten . . . (1834); (1836–1837) by I. da Costa and W. Messcher; Dr R. A. Kollewijn, Bilderdijk, Zijn Leven en werk . . . (2 vols., 1801).

BILEJK (Byzantine Beloconite), chief town of the Erthoghrul sanjak of the Brusa vilayet in Asia Minor, altitude 900 ft., situated on a hill 2½ m. from its station on the Ispind–Angora railway. Pop. 10,500 (Moslems, 7,200; Christians, 3,300). It is an important centre of the silk industry, and has several silk-spinning factories.

BILFINGER (BÜLFINGER), GEORG BERNHARD (1693–1750), German philosopher, mathematician and statesman, son of a Lutheran minister, was born on the 23rd of January 1693, at Kanstatt in Württemberg. As a boy he showed great aptitude for studies, and at first devoted himself to theology, but under the influence of Wolff’s writings he took up mathematics and philosophy on the lines of Wolff and Leibnitz. Returning to theology, he attempted to connect it with philosophy in a treatise on the relation of mathematics to philosophy, de lege deo, anima humana, et mundo (Tübingen, 1722, 1741, and 1768). This work was nothing original, but giving a clear representation of Wolff’s philosophy, met with great success, and the author was appointed to the office of preacher at the castle of Tübingen and of reader in the school of theology. In 1721, after two years’ study under Wolff, he became professor of philosophy at Halle, and in 1724 professor of mathematics. His friends at Tübingen disapproved his new views, and in 1725, on Wolff’s recommendation, he was invited by Peter the Great to lecture in St Petersburg, where he was well received. His success in winning the prize of a thousand crowns offered for a dissertation on the cause of gravity by the Academy of Sciences of Paris secured his return to his native land in 1731. In 1735, largely on account of his knowledge of military engineering, Duke Charles Alexander (1733–1737) made him a privy councillor, but his hands were tied owing to the frivolous atmosphere of the court. On the death of the duke, however, he became a member of the Regency Council, and devoted himself with energy and success to the reorganization of the state. In the departments of education, state-religion, agriculture and commerce, his administration was uniformly successful, and he became in a real sense the head of the state.

He died at Stuttgart on the 18th of February 1750. After his return from Russia, he won the highest respect at home and abroad, and Frederick the Great is recorded to have said of him, “He was a great man whom I shall ever remember with admiration.”
Beside the Dilucidations, he wrote—De harmonia animi et corporis humano commentatio (Frankfort and Leipzig, 1735; Tübingen, 1741); De origine et permissione malit (1724), an account of the Leibnitzian theodicy.

**BILGE** (a corruption of bulge, from Fr. bouge, Lat. bulga, a bag, deriving probably from an original Celtic word), the “bellty” or widest part of a ship; the broadest horizontal part of a ship's bottom above the keel: also the lowest interior part of the hull; hence “bilge-water,” the foul water which collects in the bilge. “Bilge-keels” are pieces of timber fastened to the bottom of a ship to reduce rolling (see **SHIPOUSING**).

**BILHARZIOSIS.** In various parts of Africa the inhabitants are liable to suffer from a form of endemic haematuria caused by the presence of a parasite in the mucous membrane of the urinary passages. This parasite was discovered in 1852 by Bilharz, and hence is generally known as Bilharziasis, though it has been more scientifically named Schistosoma haematobium. The condition giving rise to that of bilharziasis is the description and life history of the parasite (see **TEMATODINES**). In man the parasites and ova have been found in the minute veins of the bladder, ureter and pelvis of the kidney (more rarely in other organs), where they infest the mucous and submucous tissues. In an affected bladder the mucous membrane presents swollen vascular patches of varying size, or warty prominences on which the urinary salts may be deposited. The ova often serve as a nucleus for urinary calculi. Similar changes may take place in the ureter, and the consequent swelling lead to obstruction to the passage of urine, and if left untreated to pyelitis and pyonephrosis. If the rectum be affected the mucous membrane becomes thickened, polyloid growths form and large submucous haemorrhages may take place. As to the mode of entrance of this parasite opinion is divided. Some authorities favour the view that the entrance is through the skin, urethra or rectum, the result of bathing in infected water; others that it is taken by the mouth in water or uncooked fish. The symptoms to which it gives rise are haematuria, pain in the perineal region, and, if the parasite is present, known as schistosoma haeomatobium. (For treatment see **BILHARZIOSIS**.) If the disease continue, cystitis and its consequent train of symptoms ensue (see **BLADDER AND PROSTATE DISEASES**). If the rectum be affected there is considerable discharge of mucus, and later prolapusi ani may be the result. But the symptoms vary to a remarkable extent, from the slightest producing but little discomfort, to the most severe resulting in death. The liquid extract of male fern is the only drug used with much success. The symptoms caused by the parasite must be treated as they arise. Polypoid growths of the rectum must be surgically treated.

**BILIN** (Czech Bilina), a town of Bohemia, Austria, 90 m. N. of Prague by rail. Pop. (1900) 7871, chiefly German. It is a very old town situated on the Biela, and contains a 17th-century castle, belonging to Prince Lobkowitz. In the vicinity of the town are extensive lignite mines. Bilin is famous for its mineral springs, the Bilinert Sauherebrunnen. They have a temperature of 45-60°F, and contain a large proportion of bicarbonate of soda. About 4,500,000 bottles of water are exported annually, and another article of export is the salt, recovered from the water by evaporation in the pools. The S. of the Sauerbrunnen lies the Bogen or Bilinert Stein (763 ft.), a large mass of phonolite or dinkstone, with rare flora and fine view. The town is indeed surrounded by basaltic rocks, the largest of them being the Radelstein (2460 ft.), from which a fine view is obtained.

**BILL.** There are three words in English with distinct meanings and derivations. (1) A written, originally sealed, document. The word is derived from the Early English bille, Anglo-Latin bilia, from Latin bulla, in the medieval sense of “seal.” It is a doublit, therefore, of “bull.” (2) A common Teutonic word for a long-handled cutting weapon (O. Eng. bit, bilis, sword or falchion, O. Sax. bill, M.H.G. Bil, Mod. Ger. Bille, a pickaxe; in connexion with Gr. Béllon, an axe), of which the name and shape is preserved in the hedging-bills used for pruning hedges and lopping the branches of trees. For an account of the weapon see (2) below. (3) The beak of a bird. This may be connected with (2), but it does not appear in any Teutonic language other than English.

(1) In the sense of a document the word is used in various connexions in law and commerce.

In the English parliament, and similar legislative bodies, a bill is a form of statute (q.v.) submitted to either house, which when finally passed becomes an act. The modern system of legislating by means of bill and statute appears to have been introduced in the reign of Henry VI., superseding the older mode of proceeding by petitions from the Commons, assented to by the king, and afterwards enrolled by the judges. A bill consists of a preamble, reciting the necessity for legislation, and clauses which contain the enactments. (For procedure see **PARLIAMENT**.)

A **Bill in Chancery,** in former days, in English law, was a written statement of the plaintiff’s case whereby he complained of the wrong upon which the suit was based and prayed for relief. By the Judicature Act of 1873 and 1875 its place was taken by a writ and statement of claim (see **PETITION**).

A **Bill of Indictment** is a presentment against a prisoner, charging him with an offence, and presented at quarter sessions or assizes to the grand jury (see **INDICTMENT**).

A **Bill of Costs** is an account setting forth the charges and disbursements incurred by a solicitor in the conduct of his client’s business. The delivery of a bill of costs is by statute a condition necessary before the solicitor can sue upon it (see **COSTS**).

A **Bill of Exceptions** was formerly a statement in writing of objections to the ruling of a judge, who, at the trial, had mistaken the law, either in directing the jury, or in refusing or admitting evidence or otherwise. The bill of exceptions was tendered at any time before the verdict by counsel of the dissatisfied party, who required the judge to seal it. The case proceeded to the jury, and judgment being given, the point raised was brought before a court of error. Bills of exceptions were confined to civil cases. They were abolished by the Judicature Act 1875, and a “motion for a new trial” substituted (see **TRIAL**).

A **Bill of Health** is a certificate to the master of a ship by the consul or other proper authority of the port from which he clears, describing the sanitary state of the place. A bill of health may be either “clean,” “suspected” or “touched,” or “foul.” A “clean” bill imports that at the time the ship sailed, no disease of an infectious or contagious kind is known to exist, a “suspected” or “touched” bill, that no such disease has as yet appeared, but that there is reason to fear it; a “foul” bill, that such a disease actually exists at the time of the ship’s departure. Bills of health are necessary where the destination of the ship is a country whose laws require the production of such a bill before the ship is allowed into port, and where, in default of such production, the ship is subjected to quarantine.

A **Bill of Mortality** in England was a weekly return issued under the supervision of the company of parish clerks showing the number of deaths in a parish. During the Tudor period England suffered much from plague, and various precautionary measures became necessary. Quarantine or isolation was the most important, but to carry it out successfully it was necessary to have early warning of the existence of plague in each parish or house. There were three principal methods of searchers—usually women—who reported to the clerk the cause of each death in the parish. He, in turn, sent a report to the parish clerks’ hall, from whence was issued weekly a return of all the deaths from plague and other causes in the various parishes, as well as a list of those parishes which were free from plague. Bills of mortality are usually said to date from 1538, when parish registers were established by Cromwell (Lord Essex), but there is extant a bill which dates from August 1555, and one which is possibly even earlier than this. It is certain that they first began to be compiled in a recognized manner in December 1603, and they were continued regularly from that date down to 1842, when under the
BILLAUD-VARENNE

933

Births and Deaths Registration Act 1836 they were superseded by the registrar-general's returns. It was not till 1738, when the ages of the dead were first introduced, that bills of mortality acquired any considerable statistical value. It was on the data thus furnished that the science of life insurance was founded.

A Bill of Particulars was, in law, a statement in writing, informing each party to a suit the precise nature of the case they had to meet. It contained the plaintiff's cause of action or the defendant's set-off. Particulars are now usually indorsed on the pleadings (see PLEADING).

A Bill of Peace is, in equity, a suit brought by a person to establish and perpetuate a right which he claims, and which from its nature may be controverted by different persons at different times and by different actions; or where several attempts have already been unsuccessfully made to overthrow the same right, and justice requires that the party should be quieted in the right if it is already sufficiently established. Bills of this nature were usually filed where there was one general right to be established against a great number of persons, or where one person claimed or defended a right against many, or where many claimed or defended a right against one. Thus, a bill might be filed by one against his parishioners; by parishioners against a person to establish a modulus; by a lord against tenants for an encroachment under colour of a common right; or by tenants against a lord for disturbance of a common right. Bills were also filed in cases where the plaintiff had, after repeated and satisfactory trials, established his right at law, and yet was in danger of further litigation and obstruction to his right from new attempts to controvert it. Actions in the nature of bills of peace are still maintainable.

A Bill of Sight is a document furnished to a collector of customs or other proper officer by an importer of goods in England, who, being unable for want of full information to make a perfect entry of goods consigned to him, describes the same to the best of his knowledge and information. The goods may then be provisionally landed, but perfect entry must be made within three days by indorsing on the bill of sight the necessary particulars. In default of perfect entry within three days the goods are taken to the king's warehouse, and if perfect entry is not made within one month and all duties and charges paid, they are sold for payment thereof. See the Customs Consolidation Act 1876.

A Bill of Store is a license granted by the custom-house to re-import British goods into the United Kingdom. All British goods re-imported into the United Kingdom are entered as foreign, unless re-imported within ten years after their exportation and unless the property in the goods continues and remains in the person by whom they were exported. But in such cases they may be entered as British goods, by bill of store, with the exception of corn, grain, meal, flour and hops.

A Bill of Victualling or Victualling Bill, in its original meaning, is a list of all stores for shipment, but now an order from an export officer of the customs for the shipment from a bonded warehouse or for drawback of such stores as may be required and allowed with reference to the number of the crew and passengers on board a ship proceeding on an oversea voyage. It is made out by the master and countersigned by the collector of customs. Its object is to prevent fraud on the revenue. No such stores are supplied for the use of any ship nor any articles taken on board deemed to be stores unless they are borne upon the victualling bill, and any such stores relanded at any place in the United Kingdom without the sanction of the proper officers of the customs will be forfeited and the master and owner will each be liable to a penalty of treble the value of the stores or £100. A victualling bill serves as a certificate of clearance when there is nothing but stores on board the ship.

(2) In the sense of a weapon, the primitive forms of a bill suggest short scythe-blades or blader's bill-hooks mounted on tall staves. In such shape it is found in the hands of the English before the Conquest. English medieval documents make much confusion between the bill and the halberd and other forms of staved weapons with cutting heads. Before the 15th century the bill had been reinforced with a pike-head above the curved blade and another jutting at a right angle from the blade's back. In this form it became a popular English weapon, the "brown bill" of many ballads. Bilmen are not found in the king's host at Crécy and Calais, the bowmen carrying malls or short swords, and Henry VII.'s contracts for troops do not name the bill, which may be regarded rather as the private man's weapon. But when, in the middle of the 15th century, Walter Strickland, a Westmorland squire, contracts to raise armed men, it is noticeable that more than half his horsemen carry the bill as their chief arm, while seventy-one bowmen are to march on foot with seventy-six billmen. In the 16th century the bill, with the halber, fell out of use among regular troops, the pike taking their place on account of the longer staff, which made it a better defence against cavalry. It remained during the 17th century as a watchman or constable's weapon, although rudely-fashioned bills were seen in Sedgemoor fight. (O. B.)

BILLAUD-VARENNE, JACQUES NICOLAS (1756-1819), Jacobin revolutionary, was the author of an avocat at the parliament of Paris. He was badly brought up by a feeble father, a mother who combined immorality with religion, and a libertine abbé. At nineteen he donned the robe of an Oratorian, but did not take the vows, and busied himself with literature rather than with religion. In 1785 he left the Oratorian college where he was prefect of studies, came to Paris, married and bought a position as avocat in the parlement. Early in 1789 he published at Amsterdam a three-volume work on the Despotisme des ministres de la France, and he adopted with enthusiasm the principles of the Revolution.

At the Jacobin club he became from 1790 one of the most violent of the anti-roylist orators. After the flight of Louis XVI. to Varennes, he published a pamphlet, L'Accéphale, in which he demanded the establishment of a federal republic. On the 1st of July, in a speech at the Jacobin club he spoke of a republic, and the reference called out the stormy derision of the partisans of the constitutional monarchy; but repeating his demand for a republic on the 15th of the same month, the speech was ordered to be printed and to be sent to the branch societies throughout France. In the night of the 10th of August 1792 he was elected one of the "deputy-commissioners" of the sections who shortly afterwards became the general council of the commune. He was accused, though proof is lacking, of having been an accomplice in the massacres in the prison of the Abbaye. Elected a deputy of Paris to the National Convention, he at once spoke in favour of the immediate abolition of the monarchy, and the next day demanded that all acts be dated from the year 1 of the republic. At the trial of Louis XVI. he added new charges to the accusation, proposed to refuse counsel to the king, and voted for death "within 24 hours." On the 2nd of June 1793 he proposed a decree of accusation against the Girondists; on the 9th, at the Jacobin club, he outlined a programme which the Convention was destined gladly to realize: the expulsion of all foreigners not naturalized, the establishment of an impost on the rich, the depriving of the "anti-social" men, the creation of a revolutionary army, the licensing of all officers ci-devant nobles, the death penalty for unsuccessful generals. On the 15th of July he made a violent speech in the Convention in accusation of the Girondists. Sent in August as "representative on mission" to the departments of the Nord and of Pas-de-Calais, he showed himself inexorable to all suspects. On his return he was added to the Committee of Public Safety, which had decreed the arrest en masse of all suspects and the establishment of a revolutionary army, caused the extraordinary criminal tribunal to be named officially "Revolutionary Tribunal" (on the 20th of October 1793), demanded the execution of Marie Antoinette and then attacked Hébert and Danton. Meanwhile he published a book, Les Éléments du républicanisme, in which he demanded a division of property, if not equally, at least proportionately among the citizens. But he became uneasy for his own safety and turned
against Robespierre, whom he attacked on the 8th Thermidor as a "moderate" and a Dantonist. Surprised and menaced by the Thermidorian reaction, he denounced its partisans to the Jacobin club. He was then attacked himself in the Convention for his cruelty, and a commission was appointed to examine his conduct and that of some other members of the former Committee of Public Safety. He was arrested, and as a result of the insurrection of the 13th Germinal of the year 3 (the 1st of April 1795), the Convention decreed his immediate deportation to French Guiana. After the 18th Brumaire he refused the pardon offered by the First Consul. In 1816 he left Guiana and took refuge in Port-au-Prince (Haiti), where he died of dysentery.

In 1821 were published the Mémoires de Billaud-Varenne écrits à Port-au-Prince (Paris, 2 vols.), but they are probably forgeries. An interesting autobiographical sketch of his youth, Tableau du premier âge, composed in 1786, was published in 1888 in the review, La Révolution française. The facts of such a life need no comment. See, in addition to histories of the Revolution, F. A. Aulard, Les Ouvrages de la législature et de la convention (2nd ed., 1906). (K. A.)

**BILLET.** (1) Like the Fr. billet, a diminutive of bille, a writing), a small paper or "note," commonly used in the 18th and early 19th centuries, a "billet" or "ticket" in the sense in which this word is used in the United Kingdom, and, moreover, troops are entrained or sent by sea when the distance to be covered is more than one day's march. In Scotland the provisions as to billeting were assimilated to those in England in 1857, and in Ireland in 1879. The Army (Annual) Act 1899 provided for the billeting of the Territorial forces in case of national emergency, on occupiers of any kind of house at the discretion of the chief officer of police.

**BILLIARDS,** an indoor game of skill, played on a rectangular table, and consisting in the driving of small balls with a stick called a cue either against one another or into pockets according to the methods and rules described below. The name probably originated in the Fr. biller (connected with Eng. "billet") signifying a ticket. Of the origin of the game comparatively little is known—Spain, Italy, France and Germany all being regarded as its original home by various authorities. In an American text-book, Modern Billiards, it is stated that Caitkire More (Conn Cetchathach), king of Ireland in the 2nd century, left behind, plaited in fine filaments of gold, brass, with the pools and cues of the same materials. The term probably refers to the travels of Anacharsis through Greece, 400 b.c., during which he saw a game analogous to billiards. French writers differ as to whether their country can claim its origin, though the name suggests this. While it is generally asserted that Henrique Devigne, an artist, who lived in the reign of Charles IX., gave form and rule to the pastime, the Dictionnaire universel et l'Académie des jeux ascribe its invention to the English. Bouillet in the first work says: "Billiards appear to be derived from the game of bowls. It was anciently known in England, where, perhaps, it was invented. It was brought into France by Louis XIV., whose physician recommended this exercise." In the other work mentioned we read: "It would seem that the game was invented in England." It was certainly known and played in France in the time of Louis XI. (1423-1483). Strutt, a rather doubtful authority, notwithstanding the reputation attained by his Sports and Pastimes of the People of England, considers it probable that it was the ancient game of Paille-maille (Fall Mall) on a table instead of on the ground or floor; an improvement, he says, "which answered two good purposes: it precluded the necessity of the player to kneel or stoop exceedingly when he struck the bowl, and accommodated the game to the limits of a chamber." Whatever its origin, and whatever the manner in which it was originally played, it is certain that it was known in the time of Shakespeare, who makes Cleopatra, in the absence of Anthony, invite her attendant to join in the pastime—

"Let us to billiards: come, Charmian." Ant. and Cleo. Act ii. sc. 5.

In Cotton's Compleat Gamber, published in 1674, we are told that this "most gentle, cleanly and ingenious game" was first played in Italy, though in another page he mentions Spain as its birthplace. At that date billiards must have been well enough known, for we are told that "for the excellency of the recreation, it is much approved of and played by most nations of Europe, especially in England, there being few towns of note therein which hath not a public billiard table, neither are they wanting in many noble and private families in the country." The game was at one time played for money, like modern croquet. Some moderns consider that in this form it was

1 In 1907 an oval table was introduced in England by way of a change, but this variety is not here considered.

2 A later form of "lawn-billiards" again enjoyed a brief popularity during the latter half of the 19th century. It was played on a lawn, in the centre of which was a small ring about 4 ft. in diameter, which the players, placed four apart, were to pass through on their own side of the ring. The players, two or more, were provided with implements resembling cues about 4 ft. long and ending in wire loops somewhat smaller in diameter than the wooden balls (one for each player), which were of such a size as barely to pass through the ring. In modern times such games as billiards have afforded scope for various imitations and modifications of this sort.
introduced into Europe from the Orient by the Crusaders. The ball was rolled or struck with a mallet or cue (with the latter, if Strutt's allusion to "the conventional grip" is correct) through hoops or rings, and these were reproduced for indoor purposes on a billiard table, as well as a "king" or pin which had to be struck. In the original tables, which were square, there was one pocket, a hole in the centre of the table, as on a bagatelle board, the hoop or ring being retained. Then came similar pockets along one side, the other cushion sunk in the bed of the table; and eventually the modern table was evolved, a true oblong or double-square, with pockets opening in the cushions at each corner and in the middle of each long side. The English tables are of this type, small bags of netting being attached to the pockets. The French and American game of billiards is played on a pocketless table. We shall deal first with the English game.

**English Billiards**

The English table consists of a framework of mahogany or other hard wood, with six legs, and strong enough to bear the weight of five slabs of slate, each 2 ft. 6 in. wide by 6 ft. 3 in. long, and about 2 in. thick. These having been fitted together with the utmost accuracy to form a level surface, and a green cloth of the finest texture having been tightly strained over it, the cushions are screwed on, and the pockets, for which provision has been made in the slates, are adjusted. As the inside edge of each cushion is not perpendicular to the table, but is bevelled away so that the top overhangs the base by about \( \frac{1}{4} \) of an in., the actual playing area of the table is 6 ft. wide but is 13 in. short of 14 ft. long. The height of the table is 3 ft. 8 in. measured from the floor to the cloth. The cloth is in the shape shown in the diagram.

The three spots are on the centre line of the table, and are usually marked by small circular pieces of black tissue paper or cotter plaster; sometimes they are specially marked for the occasion in chalk. The **baulk line** and the D are marked either with chalk, tallow's pipeclay, or with a broad pen; no other marks appear on the table. Smaller tables provide plenty of practice and amusement, provided that the relation of the length to the breadth is observed. On these tables full-sized balls may be used, the pockets being made slightly smaller than in the full-size table.

In the early part of the 19th century the bed of the table was made of wood, occasionally of marble or stone; green baize was used to cover both the bed and the cushions, the latter being of slats. As the cushions came to be made of india-rubber, the old Virginia rubber was replaced by something of better quality. Vulcanite resisted the cold, but was not "fast" enough, i.e. did not permit the ball to rebound quickly; but eventually a substitute was invented, practically proof against cold and sufficiently elastic for all purposes. Late in the 19th century pneumatic cushions were tried, tubes into which air could be pumped, but they did not become general being \( \text{"vacuum"} \) cushions give good results. The shape of the cushion has gone through many modifications, owing to the difficulty experienced in the accurate striking of the ball when resting against the cushion with only a small fraction of its surface offered to the cue; but low cushions are now made which expose nearly half of the upper part of the ball.

On the size and shape of the pockets depends the ease with which the players score. The so-called "fall" or "drop," part of the arc of a circle, the circle being larger in the case of the corner pockets than in that of the middle pockets; the cushions are cut away to admit the passage of the ball. The corner pockets are measured at the points where the arc terminates in the cushions. The full of the middle pockets, i.e. the outside point of the arc, is on the line of the outside face of the cushion; that of the corner pockets is halfway down the passage in the cushions. From 1870 to 1885 matches for the championship were played on "Championship Tables," the cushions measuring only 3 in. at the "fact," but the cushions were 1 3/4 in. in the "Standard Association Tables," introduced by the Billiard Association at the end of the 19th century, the 3½-in. pocket was adopted for all matches, while the full of the middle pocket was withdrawn from play. In the championship tables the full is 3¾ in. wide and 28 in. from the cushion, and the radius of the D was reduced to 1 ft and afterwards to 10 in., the spot being 12½ in. from the top cushion.

The principal games are three in number,—billiards proper, pyramids and pool; and from these spring a variety of others. The object of the player in each game, however, is either to drive one or other of the balls into one or other of the pockets, or (only in billiards proper) to cause the striker's ball to come into contact with two other balls. The former stroke is known as a "hazard" (a term derived from the fact that the pockets used to be called hazards in old days), the latter as a "cannon." When the striker's ball strikes both balls at one stroke, he commits himself to a hazard; when the striker's ball falls into a pocket after contact with the object ball, the stroke is a "losing hazard;" "red hazards" mean that the red ball is the object-ball, "white hazards" the white.

Three balls are used in billiards proper, two white and one red. One of the white balls has a black spot at each end of an imaginary diameter, to distinguish it from the other, the white balls being equal in weight, and the object-ball, which is theoretically perfect spheres, of identical size and weight, and of equal durability in all parts. The size that is generally used in matches has a diameter of 2½ in., and the weight about 4½ oz. It is exceedingly difficult to get three such ivory balls (the best substitute, vulcanite, when new, is a little larger in diameter) into the pockets, and the balls soon lose their perfection, partly because ivory is softer in one part than another, partly because it is very susceptible to changes of weather and temperature, and unequally heated. The difference between ivory and vulcanite is a matter of common observation in the ordinary course of play. Various substitutes have, therefore, been tried for ivory, such as crystalate, or balsone (a celluloid compound), and even hollow steel; but their elasticity is inferior to that of ivory, so that the ball rebounds at a wider angle when it strikes. The price of a first-rate set of ivory balls is from four to six guineas; the composition balls cost about half a guinea apiece.

The cue is a rounded rod of seasoned ash about 4 ft. 9 in. in length, tapering to the butt and white at the tip. The butt end is usually covered with a leather cap or quirt. The tip or "nose" of the cue is made of ivory or some other heavy wood, since a shaft of plain ash is too light for its purpose, and is furthermore liable to warp. At one time it was lawful to use the butt of the cue or even a special instrument to "square" or "shape" the butt end so as to make the passage along which to slide his cue and to strike the ball. As it is impossible to reach the ball in this way, longer cues (the "half-but" and "long but") are required; they are used with a "rest," a shaft of wood at the end of which, perpendicular to the axis, is fastened a "shaper," or a metal or bone or ivory block, on the lower end of which is the "stream." A "rest," about 6 ft. long, is used with the long cues, the "short rest" (or "jigger") about 4 ft. long, with the ordinary cue. A marking-board and stands or racks for holding various balls, and a table, for all or part of the table, and cover for the table when not in use, complete the billiard "furniture" of the room, apart from its seating accommodation.

The game of **billiards proper** consists of the making of winners and losing hazards and cannons. It is usually played between two opponents (or four, two against two) for 100 or more points, three being scored for each red hazard, two for each white hazard and two for each cannon. Certain forfeitures on the other hand score to the opponent: running your ball off the table into a pocket without having hit another ball, 3 (a coup); ordinary
mises (not hitting an object-ball),

All these forfeits involve the termination of the turn. There are also "soul strokes" which score nothing to the opponent, and only involve the termination of the turn: such as playing with the wrong ball, forcing a ball off the table, hitting a ball twice, &c. When the red ball is pocketed it is replaced on the billiard-spot; if that is occupied, on the pyramid-spot; if that too, on the centre-spot; but if the opponent's white ball is pocketed it remains out of play till his turn comes. Public matches between adepts are played for higher points, but the rules which govern them are the same. The players have alternate turns, each being "in play" and continuing his "break" until he fails to score.

The game commences by striding for the lead and choice of balls. The players standing behind the baule line, strike each a ball from the center-spot, and if it fails to hit the cushion, or comes to rest nearest the bottom cushion has the choice of lead and balls. The red ball is placed on the spot at the commencement of the game, and the first player must "break the balls." The balls are said to be "broken" when the first player has struck the red on three miss; and the opponent's ball when off the table is said to be "in hand." Breaking the balls thus takes place whenever the position, as at the beginning of the game, recur. The first player (or the player who breaks the balls) may then play to the center-spot ("first hand") must place his own ball in any part of the D, or on the lines that form the D, and must play into the part of the table outside the baule line, for he may not hit direct any ball that is "in baule," i.e. on these lines, or behind the baule line, when it is struck first as a cushion out of baule (or, as it is called, brioscope). If a player fails to score, the adversary plays, as soon as all the balls are at rest, either from baule (if "in hand") or from the place where his own ball last struck, if the stroke is not made by the opponent, and loses scores, i.e. a cannon and a hazard for instance, or a winning and a losing hazard, he scores for each of them. Thus if he pockets the red ball and the cue-ball, he scores six, or if he makes a cannon and breaks the balls, he scores six, and if he breaks the balls and is followed by a winning hazard, made by the same stroke, the value of the hazard depends on the ball first struck. Thus if the cue-ball strikes the red, the cannon or the white, and runs into a pocket, the stroke counts five points, but if the same cue-ball is made to strike the white ball and the red ball strikes each of the others twice. If both object-balls are struck simultaneously it is considered that the red is struck first. Ten points are the most that can be scored by a single stroke with the cue-ball, the game being raised to twenty-five for the first player to score five balls, and hold all three. If the white ball be struck first and the same series occurs, the value of the stroke is nine points. When the cue-ball and object-ball are touching, whatever the position, the red ball is spotted, the white object-ball put on the centre-spot, and the player plays from baule.

There are various subtleties in the art of striking, which may be indicated, though only practice can really teach them; the simple stroke, and the stroke to the side, are the most obvious of these.

The side-stroke is made by striking the object-ball on the side with the point of the cue. The effect of such a mode of striking the ball is to make it travel to the right or to the left, according as it is struck, which determines the stroke to the side a straight stroke, or one which is made so as to cause the ball to proceed in a direction more or less slanting than is usual, or ordinary, when the ball is struck in or about the centre of its circumference. Many hazards and cannons, quite impossible to be made with the central stroke, are accomplished with ease and certainty by the side-stroke. It was the invention of the leather tip which made side possible. The screw, or twist, is made by striking the ball low down, with a sharp, sudden blow. According as the ball is nearer or farther from the cushion, it stops dead at the point of concussion with the object-ball, or recoils by a series of reverse revolutions, in the manner familiar to the schoolboy in throwing forward a hoop, and causing it to return to his hand by the twist given to the handle. The follow is made by striking the ball high, with a flowing or following motion of the cue. Just as the low stroke impedes the motion of the ball, the follow expedites it. The stroke is made free from the sudden jerk of the screw, and with less than the onward push of the follow.

The spot-stroke is a series of winning hazards made by pocketing the red ball in one of the corners from the spot. The great art is, first to hit the red direct, and, secondly, to leave the striking ball in such a position as to enable the player who breaks to make a spot-stroke in one or other of the corner pockets. To such perfection was the spot-stroke brought, that at the end of the 17th century it was necessary to provide for the "spot-barred" game became consequently the rule for all players. The leading English professionals so completely mastered the difficulties of the stroke and made such long successions of hazards that they practically held all public interest in billiards, the game being little more than a monotonous series of spot-strokes. In 1888 W. J. Cox made 633 "spots" in succession, and in 1890 in a break of 3304—the longest record—no less than 3183 of the points were scored through spot-stroke breaks. J. G. Sala, by use of the screw-back made 186 successive hazards in one pocket, but C. Memmott is said to have made as many as 423 such strokes in succession. The spot-stroke was known and used in 1825, when a run of twenty-two "spots" caused quite a sensation. The player, whose name was announced to play any man in England, jun., and others, assisted by the improvements made in the implements of the game, by the American and other countries, made 217 in a single run, and the term "spot-barred" was adopted as the name of the game, so as to make the stroke exceedingly difficult. C. Roberts, sen., who succeeded Kentfield as champion in 1849, worked hard at the stroke, but never made, in public, a longer run than 104 in succession. But W. Cook, John Roberts, jun., and others, assisted by the improvements made in the implements of the game, succeeded in making 270. Billiards became thus a game of hazards, and in 1825, P. W. Beal, who made such a run, was barred as unfair. It was usually employed when cue-ball and cannon were scored separately, and the third was in line, or nearly in a line with them; then by placing the tip of the cue very close to the ball, a cannon or a feedback, or, if not striking, the object-ball could be pushed aside and the cue-ball directed on ball 3.

Balls Jammed Pockets.—If the two object-balls are jammed, the incident or design, in the jaws of a corner pocket, an almost inextricable series of cannons may be made by a skilful player. T. Taylor made as many as 729 cannons in 1891, but the American champion, Frank C. Ives, in a match with John Roberts, jun., easily beat the Englishman, getting up 220 in 1891, and broke up the balls. In Ives's case the balls, however, were just outside the jaws, which were skilfully used to keep the balls close together; but in this game, which was a compromise between English and American methods, the balls were always 12 in number and used. Under the aegis of the Billiard Association a tacit understanding was arrived at that the position must be broken up, should it occur. A similar position came into discrédit in 1907, in the case of the ball was not actually jammed, but so close on each side of a pocket that a long series of cannons could be made without disturbing the position—a stroke introduced by Lovesjoy and carried to extremes by F. Ives and his brother. The Quill or Feather Stroke.—This stroke was barred early in the game's history. It could only be made when the cue-ball was in hand and the object-ball just outside that part of the baule-line that the cue-ball is allowed to travel and was said to be only a "feedback" as a ball only not to touch it, and was thus pushed very gently into the pocket, grazing the other so slightly as just to make it, and no more. A number of similar strokes could thus be made before the object ball was out of position. A "dilly" was a losing hazard into one of the (generally top) pockets when the object-ball is close to the cushion along which the pocket lies; it requires to be played with the side required to turn the ball into the pocket. Long jennies to the top pockets are a difficult and pretty stroke: short jennies are into the middle pockets.

Massé and Piqué.—A massé is a difficult stroke made by striking downwards on the upper surface of the cue-ball, the cue being held under hand and the cue-ball being directed towards the centre of the ball. It is generally used to make an object when the three balls are more or less in a line, the cue-ball and object-ball being close together. The term massé is often used in reference to a stroke made by striking the cue-ball as close to the cue-ball as the latter to the cushion, or the third ball to make screwing impossible; the cue is then raised to an angle of almost 45° or 50° and its axis directed to the centre of the cue-ball, in which way the object-upward the classic "massé" or "piqué". The French player, says, "Le massé est un piqué." Massé is in fact piqué combined with side.

The perfection of billiards is to be found in the nice combination of the strokes, the central stroke, the spot-stroke, &c. to leave the balls in a favourable position after each individual stroke. This perfection can only be attained by the most constant and unremitting practice. When the cue-ball is so played that its centre is aimed at the extreme edge of the object-ball, the cue-ball's course is determined at what is called the "natural" or "full-ball" angle. If the balls were flat discs instead of spheres the edge of one ball would touch the centre of the other. The object-ball is struck at three-quarter ball or "quarter-ball" according as the edge of
the cue-ball appears to strike mid-way between the half-ball point and the centre or edge respectively of the object-ball. The half-ball angle is regarded as the standard angle for billiards, other angles being termed only as "rather more or less than half-ball." The angle of the cue ball's low come would be about 45°, were the object-ball fixed, but as the object-ball moves immediately it is struck, the cue-ball is not actually diverted more than 35° from the prolongation of its original course, it being conventional among players to regard the prolongation of the course and not the original track when calculating the angle. The natural angle, and all angles, may be modified by side and screw; the use of strength also makes the ball go off at a wider angle.

Development in Billiard Play.—The modern development of English billiards is due mainly to the skill of such leading players as John Roberts, sen., and his son of the same name. Indeed, their development of modern billiards for Americans has its roots in the time when the elder Roberts challenged Kentfield (who declined to play) for the championship. No useful comparison can be made between the last-named men, and the change of cushions from list to India-rubber further complicates the question. Kentfield represented the best of the old style of play, and was a most skilful performer; but Roberts had a genius for the game, combined with great nerve and physical power. This capacity for endurance enabled him to practise single strokes till they became second nature, when weaker men would have failed from sheer fatigue; and that process applied to the acquisition of the spot-stroke was what placed him decisively in front of the players of his day until a younger generation took him for granted. In 1869 the younger generation had caught up, and soon afterwards surpassed him at this stroke; but W. M. Mitchell and W. J. Peall. It is curious to realize that John Roberts, sen., developed the game chiefly by means of spot-play, whereas his son continued the process by abandoning it. The public, however, liked quick scoring and long breaks, and therefore a substitute had to be devised. This was provided chiefly by the younger Roberts, whose fertility of resource and manual dexterity eventually placed him by a very long way at the head of his profession. In exhibition matches he barred the spot-stroke and gave his attention chiefly to top-of-the-table play.

The next development was borrowed from the French game (see below), which consists entirely of cannons. Both French and American professors, giving undivided attention to cannons and not being permitted to use the 'pin stroke,' arrived at a performance that was outside the "average" the English players could not pretend; yet the principles involved in making a long series of cannons were applied, and leading professionals soon acquired the necessary delicacy of touch. The plan is to get the three balls close to each other, say within a space which a hand can cover, and not more than from 4 to 8 in. from a cushion. The striker's ball should be behind the other two, one of which is nearer the cushion, the other a little farther off and farther forward. The striker's ball is tapped quietly on the one next the cushion, and hits the third ball so as to drive it an inch or two in a line parallel to the cushion. The ball first struck rebounds from the cushion, and at the close of the stroke all three balls are at rest in a position exactly similar to that at starting, which is called by the French the 'position morte.' Thus each stroke is a repetition of the previous one, the positions of the balls being relatively the same, but actually forming a series of short advances along the cushion. With the push-stroke a great number of these cannons could be quickly made, say 50 in 3½ minutes; and, as that means 100 points, scoring was rapid. Most of the great spot-barred breaks contained long series of these cannons, and their value as records is correspondingly diminished, for in such hair's-breadth distances very often no one but the player, and sometimes not even he, could tell whether a stroke was made or missed or was foul. Push-barred, the cannons are played nearly as fast; but with most men the series is shorter, massè strokes being used when the cannon cannot be directly played.

**Championship.**—When Kentfield declined to play in 1849, John Roberts, sen., assumed the title, and held the position till 1870, when he was defeated by his pupil W. Cook. The following table gives particulars of championship matches up to 1885:

**Notes:**

These games were played on three-inch-pocket tables, and John Roberts, jun., fairly contended that he retained the championship till been on such a table under the rules in force, for he won the title or under a new code to which he was a consenting party. A match was played for the championship between Roberts and Dawson in 1899 of 18,000 up, level. The main departure from a championship game lay in the table, which had ordinary, though not easy pockets, instead of three-inch pockets. The match excited much interest, because Dawson, who had already beaten North for the Billiard Association championship, was the first man for many years to play Roberts even; but Roberts secured the game by 1814 points. After this Dawson improved materially, and in 1899, for the second time, he won the Billiard Association championship.

His performance was challenged by Diggle and Stevenson, who played a game of 9000 points. Stevenson won by 6900, but lost to Dawson by 7290. In January 1901, and though Dawson won a match before the close of the spring, Stevenson continued to establish his superiority, and at the beginning of 1902 was uncontestedly the English champion.

**Records.**—Record scores at billiards have greatly altered since W. Cook's break of 936, which included 292 spots, and was made in 1873. Big breaks are in some degree a measure of development; but scores vary considerably between easy and difficult ones, and comparisons are apt to mislead. Peall's break of 3304 (1890) is the largest "all-in" score on record; and in the modern spot-barred and push-barred game, the championship table was in April 1904 made 788 against C. Dawson. In January 1905 John Roberts, however, made 821 in fifty minutes, in a match with J. Duncan, champion of Ireland; but this was not strictly a "record," since the table had not been measured officially by the Billiard Association. A break of 985 was made by Diggle in 1895 against Roberts, on a "standard table" (before the reduction in size of the pockets). On the 9th of March 1907 T. Reece began beating records by means of the "anchor" stroke, making 1269 (521 cannons), and he made an unfinished 4593 with the same stroke (2268 cannons) on the 23rd of March. Further large breaks followed, including 23,769 by Dawson on the 20th of April 1909, and even more by Reece; which seems the end of the year the Billiard Association ruled the stroke out.

**Handicapping.**—The obvious way of handicapping unequal players is for the stronger player to allow his opponent an agreed number of points by way of start. Or he may "owe" points, not begin to reckon his score till he has scored a certain number. A good plan is for the better player to agree to count no breaks that are below a certain figure. The giver of points scores all fords for misses, &c. If A can give B 12 points, and B can give C 25 points, the number of points that A can give C is calculated on the following formula, \(20 + \frac{25}{20} \times 25 = 60\). The handicap of "barring" one or more pockets to the better player, he having only four or five pockets to play into, has been abolished in company with other methods that tended to make the game tedious.

**Pyramids** is played by two or four persons—in the latter case in sides, two and two. It is played with fifteen balls, placed close together by means of a frame in the form of a triangle or pyramid, with the apex towards the player, and a white striking ball. The centre of the apex ball covers the second or pyramid
spot, and the balls forming the pyramid should lie in a compact mass, the base in a straight line with the cushion.

In this game, it is entirely of winning hazards, and who succeeds in pocketing the greatest number of balls wins. Usually the pyramid is made of fifteen red or coloured balls, with the striking ball white. This white ball is common to both players. Having decided on the lead, the first player, placing his ball in the baule—sometimes he deliberately allows his opponent to pocket a ball or gets a ball in a pocket to get the white safely back into baule. Should he fail to pocket a red ball, the other player goes on and strikes the white ball from the place at which it stopped. When either succeeds in making a red ball, the play alternates, and each player continues playing until he has pocketed red and ts. balls. The player wins a life by pocketing a red ball or forcing it over the table; and loses a life by running his own, the white ball into a pocket, missing the red ball, or intentionally giving a miss. In this game the baule is no protection; that is to say, the player can pocket any ball wherever it lies, either within or without the baule line, and whether the white be in hand or not. This liberty is a great and certain advantage under many circumstances, especially to the hand of a good player. It is not a very uncommon occurrence for an adept to pocket six or eight balls in a single break. Both Cook and Roberts have been known, indeed, to pocket the whole fifteen. If four persons play at pyramids, the rotation is decided by lot; the cream player, first—the cream player being allowed to advise each other, each going on and continuing to play as long as he can, and ceasing when he misses a hazard. Fourl strokes are reckoned as in billiards, except as regards balls touching each other. If the balls strike each other, the play proceeds with the baule a ball being white winning hazard. When all the red balls but one are pocketed, he who made the last hazard plays with the white and his opponent with the red, and so on alternately, till the game terminates by the holing out of the orange ball. The pyramids balls are usually a little smaller than the billiard balls; the former are about 2 in. in diameter, the latter 2¾ in. to 2¼ in.

Losing Pyramids, seldom played, is the reverse of the last-named game, and consists of losing hazards, each player using the same striking ball, and taking a ball from the pyramid for every losing hazard. As in the other game, the baule is no protection. Another variety of pyramids is known as Shell-out, a game at which any number of persons may play. The play is similar to that in the company play in rotation. For each winning hazard the striker receives from each player a small stake, and for each losing hazard he pays a like sum, till the game is concluded, by pocketing the white and the ball on the wrong side.

Pool, a game which may be played by two or more persons, consists entirely of winning hazards. Each player subscribes a certain stake to form the pool, and at starting has three chances or lives. He is then provided with a coloured or numbered ball, and the game commences thus:—The white ball is placed on the spot and the red is placed at it from the baule semicircle. If the player pocket the white he receives the price of a life from the owner of the white; but if he fail, the next player, the yellow, plays on the red; and so on alternately till all have played, or till a ball be pocketed. When a ball is pocketed the striker plays on the ball nearest his own, and goes on playing as long as he can score.

The order of play is usually as follows:—The white ball is spotted; red balls upon white; yellow upon red; then blue, brown, green, than blue, brown, and so on to white again. This is the order for playing on spot-white. The order is similar for a larger number, but it is not common for more than seven or eight to join in a pool. The player wins a life for every ball pocketed, and receives the sum of the balls on the table. He then continues playing; but fails, if a hazard is struck. The hazard is an orange, or otherwise as decided before the game. If the player strike the orange, he pocket the same, and is again allowed to play, with the baule a ball being white winning hazard. If the striker be a hazard he must play to the white, and if the player's ball happens to be on the baule, he plays the ball at the nearest to the centre spot on the baule line, whether it be in or out of baule. In such a case the striker can play from any part of the semicircle. Any ball lying in the way of the striker's ball, and preventing him from taking fair aim and reaching the object-ball, must be removed, and replaced after the stroke. If there be any doubt as to the nearest ball, the distance must be measured by the marker or umpire; and if the distance be equal, the ball to be played upon must be decided by chance. If the striker first pocket the ball he plays on and then runs his into a pocket, he loses a life to the player whose ball he pocketed. The white ball is then to be considered in hand. The first player who loses all his three lives can "star"; that is, by paying into the pool a sum equal to his original stake, he is entitled to as many lives as the number of the marking board. Thus if the lowest number be 2, he must stand 2 balls in the pool, and the other players may be allowed to purchase the 6 balls left in a pool; and when there are only two players left in, no star can be purchased. The price of each life must be paid by the player losing it, immediately after the stroke is made; and the stake of pool, if any, belong to the player whose ball was pocketed. In the event, however, of the two players last left in the pool having an equal number of lives, they may either play for the whole or divide the stake. The latter, the usual course, is followed except when the company is a large one. When two players are left, each with one life, and the striker makes a miss, the two remaining divide the pool without a stroke—this rule being intended to meet the possible case of two players combining to take advantage of a "pair." When the striker has to play, he may ask which ball he has to play at, and if being wrongly informed he play at the wrong ball, he does not lose a life. In clubs and public rooms it is usual for the marker to call the order and rotation of play:—Red upon white, yellow upon red, green upon yellow. Should there be a pocketed billiard-score (as in billiards), the fact is notified—"Brown upon white, and green's your player, in hand"; and so on till there are only two or three players left in the pool.

There are some varieties of the game which need brief mention.

Single Pool is the white winning hazard game, played for a stake and so much for each of three or more lives. Each person has a ball, usually white and spot-white. The white is spotted, and the other plays on it from the baule semicircle; and each player alternately takes it out of the baule and pocket it, and pays the stake which is agreed upon. The who has pocketed the white holds the game, and if he fails to pocket a ball, the other player is allowed to play, and if he fails, the next player in rotation has a chance. The white is pocketed after the third ball, and if the white ball sells a life he pays a life, and the taker of the three lives wins the game. No stake is allowed in single pool. The rules regulating pool are observed.

Double Pool is similar to single pool, but each player has one of the ordinary coloured balls, and in the same order of succession. All the rules of pool are followed, except that the baule is a protection. The white is spotted, and the red plays on it; after that each striker plays several times in rotation, with neither stake, and pays the stakes. If the white is pocketed, the other player loses a life, but if the balls lie within the baule-line, and the striker's ball be in hand, he must play up to the top cushion, or place his ball on the spot. If his ball be not in hand, he plays at the nearest ball, wherever it may lie.

Black Pool.—In this game, which lasts for half-an-hour, there are no lives, the player whose ball is pocketed paying the stake to the pocketer. Each player receives a coloured ball and plays in order as in, and yellow, brown and white, and when a player has pocketed the white, has the privilege of concealing his ball. In addition, however, a black ball, which is spotted on the centre-spot. When a player has taken a life he may—In some rooms and clubs—"play on the black ball." If he pockets it he receives a stake, and pays the stakes for completing the game. He commits any of the errors for which he would have to pay at "Following Pool." The black ball cannot be taken in consecutive strokes. Sometimes a pink ball, spotted on the pyramid spot, is added and a single stake is paid all round to the man who pockets it, and a double stake to the man who pockets a red ball. The striker must take blacks and pinks alternately without pocketing a coloured ball between the strokes. Again it is the custom in certain rooms to let a player, after the first round, pay on any ball. The game is always begun by the taker of the ball at the billiard-spot at pyramids—the remaining balls being the cue-ball for all players. The pyramid balls, set up as in pyramids, count one point each; the yellow ball two points, green ball three, and so on. The black is put on the billiard-spot, the pink on the true white, and the blue on the orange. The player who gets the most balls must pocket the billiard-spot ball first, in order to win the game. The order of colours as shown on the marking board, are obliged to strike a red ball first. If it is pocketed, the player scores one and is at liberty to play on any of the coloured balls; though in some clubs he is compelled to play on the next unplayed ball. A pendant ball must be pocketed in the pool order and are not replaced. The
penalties for missing a ball, running into a pocket, &c., are deducted from the player’s score; they correspond to the values of the balls, one point if the red be missed, two if the yellow be missed, &c. If, before hitting the proper ball, the player hits one of a higher value, he must return to the point of impact, and must touch the ball of the same value, and incur a further penalty. A player is “snookered” if his ball is so placed that he cannot hit a ball on which he is compelled to play. In this connection it should be observed that a player may make a stroke without touching his own balls, thus trying to hit the proper ball off the cushion, being liable to the usual penalty if in so doing he hits a ball of higher value. In some rooms it is considered fair and part of the game to snooker an opponent deliberately; in others the practice is condemned. The rules of the game are that the printed rules are not of much value, owing to local by-laws.

Among other games of minor importance, being played in a less serious spirit than those mentioned, are Selling Pool, Nearest Ball Play, and Carrom. The full details of playing these games may be found in *Billiards* (Badminton Library series).

**French and American Billiards.**—French and American billiards is played on a pocketless table, the only kind of table that is used in France, though the English table with six pockets is also occasionally to be found in America. For match purposes the table used measures 10 ft. by 5 ft., but in private houses and clubs 9 ft. by 4½ ft. is the usual size, while tables 8 ft. by 4 ft. are not uncommon. The balls, three in number as in English billiards, measure from 2¼ to 2½ in., the latter being made of the same size. Since they are both larger and heavier than the English balls, the cues are somewhat heavier and more powerful, so that better effects can be produced by means of side, masses, &c. Only cannons (called in America “caroms,” in French *caramboles*) are played, each counting one point.

The three-ball carom game is the recognized form of American billiards. The table is marked with a centre-spot, “red” spot and “white” spot. The first is on the centre of an imaginary line dividing the table longitudinally into halves; the red (for the red ball) and white spots are on the same line, halfway between the centre-spot and the end cushions, the white spot being on the spring line, 1 in. closer to the rail than to the cushion. The play is decided, as in England, by “stringing.” The opponent’s ball and the red ball being spotted, the player plays from within the imaginary baulk-line. Each carom counts one point; a missing carom is an object ball scored; any carom, whether on the baulk-line or spotted if it has been forced off the table, should be red forced off the table and the red spot be occupied, it is placed on the white spot. White under similar conditions is set on the red spot. The centre spot is the only one to count. If a carom is made, and the table afterwards jumps off the table, it is spotted and the count allowed. If the striker misses a ball not his own before he strikes, he cannot count; but if the striker makes a carom, and the carom does not count, he forfeits one, and his break is ended. If he touches his own ball before he plays, he forfeits a point, and cannot play the stroke. Should he, however, touch his ball a second time, and on the second touch have the opportunity, as exactly as possible, or of playing on them as they are left, it is a foul stroke to play with the wrong ball, but if the offence is not detected before a second stroke has been made, the player may count.

Such long runs of caroms, chiefly on the rail, along the cushion, have been made by professional players (H. Kerckau, the German champion, making 7150 caroms in 1901 at Zurich), that various methods have been adopted to terminate them. One of these is known as the “continuous baulk-line.” Lines are drawn, 8, 14, 18 or even 22 in., from the rails, parallel to the side of the table, forming with them eight compartments. Of these 14 and 18 are the most usual; the 22 are not so used. When play is continued over the 8-in. side-rails, 2 balls are allowed to be made in every space, unless one at least of the object-balls is driven over a line. In the space left in the middle of the table any number of caroms may be made without restriction. In the case of the Triangular Baulk-lines, lines are drawn at the four corners from the second “sight” on the side-rails to the first sight on the end-rails, forming four triangles within which only a limited number of caroms may be made, unless one object-ball at least is driven over a line. The Anchor Baulk-line were devised to checkmate the “snooker.”

High-Low-Jack Game is played with a set of pyramid balls by any number of players, the order of starting being determined by distribution of the small balls from the pool-ball. The 15-ball is the cue-ball, the 1-ball is the second ball, and so on, the numbers of the balls being as in *International*. The main object is to make 2-ball or 4-ball breaks, or caroms. The game is only won by the player who makes the highest number of caroms. In *Billiards* the game is called “the Bottle.”

**THE CUSHION CAROM.** The *Cushion Carom* is a variety of the ordinary three-ball game, in which no caroms count unless the cue-ball touches a cushion before the carom is completed. There is also *Three-Cushion Carom*, which is explained by its title, and the *Bank-Shot Carom*, in which the cue-ball is struck into the cushion, and then the object ball must touch the other cushion. The best cushion carom games are often used in handicapping, other methods of which are for the better player to make a certain number of caroms or no count, and for the weaker to receive a number of points in proportion to the number of caroms he makes.

In France billiards was played exclusively by the aristocracy and the richer middle class until the first part of the 17th century, when the privilege of keeping billiard-rooms was accorded to the *billiards-players* and the player was *laissé faire*. The most popular French player of late is Maurice Vignaux. The French game became the accepted one in the United States about 1870, and the best American players have proved themselves superior to the French. The most noted of the American masters have been F. Daly, Shafer, Slosson, Carter, Sexton and Frank C. Ives, doubtless the most brilliant player who ever lived. His record for the 18-in. baulk-line game was an amazing 40, with a high of 200 points. In cushion-caroms he scored a run of 85.

The four-ball game, the original form of American billiards, is practically obsolete. It was formerly played on an English six-pocket table, with a little ball, known as a white, and two white one. The ball in play was a white one, and the object for the striker was a corner ball just hard enough to break but not hard enough to break up the balls, as in that case the second player would have too great an advantage. Balls pocketed by chance in the same place in which the ball has been legitimately put down are counted; but if pockets are made in two places, or in adjacent pockets, the caroms are canceled. In Continuous Pool each frame (fifteen balls) constitutes a game. The *Continuous Pool* is the game for a series of points, generally 100, the balls being set up again after each frame and the player pocketing the cue ball having the choice whether to break or cause his opponent to do so.

The games of Fifteen-Ball Pool are generally all of one colour, usually red. In *Pyramid Pool* they are pair-coloured as well as number, and a single ball is composed of two, and is known as the “two-ball.” A player is *defeated* by missing the “2-ball” or pocketing the 2-ball; the player pocketing the 2-ball is known as the “2-ball.”

There are various methods of scoring points. The best known are *American* and *Continental*. In the former, the most points, of the five possible, are scored, the other penalties being: 1. The player pocketing the 2-ball is scored 2, and the one pocketing the 2-ball is scored 1. 2. The player pocketing the 2-ball is scored 3, and the player pocketing the 2-ball is scored 2. 3. The player pocketing the 2-ball is scored 4, and the player pocketing the 2-ball is scored 3.

The game of Thirty-Four is played without a bottle, the scoring being by caroms or pocketing the two object-balls. Exactly 34 points are scored. The 4-pointed or bottle is pocketed on being hit by the cue-ball, and the other four are pocketed on being hit by a player’s object-ball.

**High-Low-Jack Game** is played with a set of pyramid balls by any number of players, the order of starting being determined by distribution of the small balls from the pool-ball. The 15-ball is the cue-ball, the 1-ball is the second ball, and so on, the numbers of the balls being as in *International*. The main object is to make 2-ball or 4-ball breaks, or caroms. The game is only won by the player who makes the highest number of caroms. In *Billiards* the game is called “the Bottle.”

When two or more players
have the same score the High ball wins before the Low, &c., as in the card game of the same title.

*Pin Pool* is played with two white balls, one red and five small pins set up in diamond form in the centre of the table with the pin corner on the breach, and the small pins being free. Each player is given a small ball from the bottle and this he keeps secret until he is able to announce that his points, added to the number on his small ball, amount to exactly 31. If he succeeds, he makes his knock-bottom, which are numbered 1 to 5. Should a player knock down with one stroke all four outside pins, leaving the 5-pin standing, it is a "natural" and he wins the game.

Bills of exchange are a pool there are others which are played in different parts of America, many of them local in character.

**Bibliography.**—The scientific features of billiards have been discussed lengthily and fully in the following works:—E. White, *Practical Treatise on the Game of Billiards* (1807), this was partly a translation of a French treatise, published in 1805, and partly a compilation from the article in the *Academia universale des jeux* (Paris, 1815).

**Billington—Bill of Exchange.**

The Billington was a form of negotiable instrument, defined below, the history of which, though somewhat obscure, was traced in a memorandum by Lord Chief Justice Cockburn in his judgment in *Goodwin v. Roberts* (1875), 1 R. & R. 346-356. Bills of exchange were probably invented by Florentine Jews. They were well known in England in the middle ages, though there is no definite evidence of a bill of exchange before the year 1603. At first their use seems to have been confined to foreign bills between English and foreign merchants. It was afterwards extended to domestic bills between traders, and finally to bills of all persons, whether traders or not. But for some time after they had come into general employment, bills were always allowed in legal proceedings to be drawn *secundum usum et consuetudinem mercatorum.* The foundations of modern English law were laid by Lord Mansfield with the aid of judges of English merchants. No better tribunal of commerce could have been devised. Subsequent judicial decisions have developed and systematized the principles thus laid down. Promissory notes are of more modern origin than bills of exchange, and their validity as negotiable instruments was doubtful until it was confirmed by a statute of Anne (1702). Cheques are the creation of the modern system of banking.

Before 1882 the English law was to be found in 17 statutes dealing with isolated points, and about 2500 cases scattered over some 300 volumes of reports. The Bills of Exchange Act 1882 codifies for the United Kingdom the law relating to bills of exchange, promissory notes and cheques. One peculiar Scottish rule is preserved, but in other respects uniform rules are laid down for England, Scotland and Ireland. After glancing briefly at the history of these instruments, it will probably be convenient to discuss the subject in the order followed by the act, namely, first, to a treat of a bill of exchange, which is the original and typical negotiable instrument, and then to refer to the special provisions which apply to promissory notes and cheques. Two salient characteristics distinguish negotiable instruments from other engagements to pay money. In the first place, the assignee of a negotiable instrument, to whom it is transferred by indorsement or delivery according to its tenor, can sue thereon in his own name; and, secondly, he holds it by an independent title. If he takes it in good faith and for value, he takes it free from "all equities," that is to say, all defects of title or grounds of defence which may have attached to it in the hands of any previous party. These characteristic privileges were conferred by the law merchant, which is part of the common law, and are now confirmed by statute.

**Definition.**—By § 3 of the act a bill of exchange is defined to be "an unconditional order in writing, addressed to one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a fixed or determinable future time, a sum certain in money to order, or to order of a specified person, or to bearer." The person who gives the order is called the drawer. The person thereby required to pay is called the drawee. If he assents to the order, he is then called

1 This is also the definition given in the United States, by § 126 of the general act relating to negotiable instruments, prepared by the Joint Commission on Uniform State Laws, and it has been adopted in the leading states.
BILLS OF EXCHANGE

941

the acceptor. An acceptance must be in writing and must be
signed by the drawee. The mere signature of the drawee is
sufficient (§77). The person to whom the money is payable is
called the payee. The person to whom a bill is transferred by
indorsement is called the indorsee. The generic term "holder"
includes any person in possession of a bill who holds it either as
payee, indorsee or bearer. A bill which in its origin is payable
to order becomes payable to bearer if it is indorsed in blank.
If the payee is a fictitious person the bill may be treated as
payable to bearer (§ 7).

The following is a specimen of an ordinary form of a bill of
exchange:

—

£100

LONDON, 1st January 1901.

Three months after date pay to the order of Mr J. Jones the sum
of one hundred pounds for value received.

BROWN & CO.

To Messrs. Smith & Sons, Liverpool.

The scope of the definition given above may be realized by
comparing it with the definition given by Sir John Comyns' Digest
in the early part of the 18th century:— "A bill of exchange
is when a man takes money in one country or city upon exchange
and draws a bill whereby he directs another person in another
country or city to pay so much to A, or order, for value received
of B, and subscribes it." Comyns' definition illustrates the
original theory of a bill of exchange. A bill in its origin was
a device to avoid the transmission of cash from place to place
to settle trade debts. Now a bill of exchange is a substitute for
money. It is immaterial whether it is payable in the place where
it is drawn or not. It is immaterial whether it is stated to be
given for value received or not, for the law itself raises a pre-
sumption that it was given for value. But though bills are a
substitute for cash payment, and though they constitute the
commercial currency of the country, they must not be confounded
with money. No man is bound to take a bill in payment of debt
unless he has agreed to do so. If he does take a bill, the instru-
ment ordinarily operates as conditional, and not as absolute
payment. If the bill is dishonoured the debt revives. Under
the laws of some continental countries, a creditor, as such, is
entitled to draw on his debtor for the amount of his debt, but in
England the obligation to accept or pay a bill rests solely on
actual agreement. A bill of exchange must be an unconditional
order to pay. If an instrument is made payable on a contingency,
or out of a particular fund, so that its payment is dependent on
the continued existence of that fund, it is invalid as a bill,
though it may, of course, avail as an agreement or equitable
assignment. In Scotland it has long been the law that a bill
cannot operate as an assignment of funds in the hands of the
drawer, and § 53 of the act preserves this rule.

Stamp.—Bills of exchange must be stamped, but the act of
1882 does not regulate the stamp. It merely saves the operation
of the stamp laws, which necessarily vary from time to time
according to the fluctuating needs and policy of the exchanger.
Under the Stamp Act 1891, bills payable on demand are subject
to a fixed stamp duty of one penny, and by the Finance Act 1899,
a similar privilege is extended to bills expressed to be payable not
more than 10 days after sight or date. The stamp may be im-
pressed or adhesive. All bills drawn are liable to an ad
valorem duty. Inland bills must be drawn on stamped paper,
but foreign bills, of course, can be stamped with adhesive. As
a matter of policy, English law does not concern itself with
foreign revenue laws. For English purposes, therefore, it is
immaterial whether a bill drawn abroad is stamped in accordance
with the law of its place of origin or not. On arrival in England
it has to conform to the English stamp laws.

Maturity.—A bill of exchange is payable on demand when it is
expressed to be payable on demand, or at sight, or on presenta-
tion or when notice for payment is expressed. In calculating
the maturity of bills payable at a future time, three days, called
days of grace, must be added to the nominal due date of the bill.
For instance, if a bill payable one month after sight is accepted
on the 1st of January, it is really payable on the 4th of February, and
not on the 1st of February as its tenor indicates. On the continent
generally days of grace have been abolished as anomalous and
misleading. Their abolition has been proposed in England, but
it has been opposed on the ground that it would curtail the credit
of small traders who are accustomed to bills drawn at certain
fixed periods of currency. When the last day of grace is a non-
business day some complicated rules come into play (§ 24).

Speaking generally, when the last day of grace falls on Sunday
or a common law holiday the bill is payable on the preceding
day, but when it falls on a bank holiday the bill is payable on the
succeeding day. Complications arise when Sunday is preceded
by a bank holiday; and, to add to the confusion, Christmas day
is a bank holiday in Scotland, but a common law holiday in
England. When the code was in committee an attempt was
made to remove these anomalies, but it was successfully resisted
by the bankers on alleged grounds of practical convenience.

Acceptance.—By the acceptance of a bill the drawee becomes
the principal debtor on the instrument and the party primarily
liable to pay it. The acceptor of a bill "by accepting it engages
that he will pay it according to the tenor of his acceptance," and
is precluded from denying the drawer's right to draw or the
genuineness of his signature (§ 54). The acceptance may be
made by the drawer's order. The holder is not obliged to take it;
and if he chooses to do so he must make a subcontract with
the antecedent parties, acting at his own risk if they dissent (§§ 19
and 20). The drawer and indorsers of a bill are in the nature of
sureties. They engage that the bill shall be duly accepted and paid
according to its tenor, and that if it is dishonoured by non-acceptance
or non-payment, as the case may be, they will compensate the
holder provided that the requisite proceedings on dishonour are
duly taken. Any indorser who is compelled to pay the bill has
the like remedy as the holder against any antecedent party (§ 55).
A person who is not the holder of a bill, but who backs it with its
signature, thereby incurs the liability of an indorser to a holder
in due course (§ 56). An indorser may by express term either
restrict or charge his ordinary liability as stated above. Prima
facie every signature to a bill is presumed to have been given for
valuable consideration. But sometimes this is not the case.
For friendship, or other reasons, a man may be willing to lend
his name and credit to another in a bill transaction. Hence arise
accommodation bills. Ordinarily, the acceptor gives his acceptance
to accommodate the drawer. But occasionally both drawer and
acceptor sign to accommodate the payee, or even a person who is not
a party to the accommodation. The criterion of an accommodation
bill is the fact that the principal debtor according to the instrumen
t has lent his name and is in substance a surety for some one else.
The holder for value of an accommodation bill may enforce it exactly as if it was an ordinary
bill, for that is the presumable intention of the parties. But if
the bill is dishonoured the law takes cognizance of the true
relations of the parties, and many of the rules relating to principal
and surety come into play. Suppose a bill is accepted for the
accommodation of the drawer. It is the drawer's duty to provide
the acceptor with funds to meet the bill at maturity. If he fails
to do so, he cannot rely on the defence that the bill was not duly
presented for payment or that he did not receive due notice of
dishonour. If the holder, with notice of the real state of the
facts, agrees to give time to the drawer to pay, he may thereby
discharge the acceptor.

Holder in due Course.—The holder of a bill has special rights
and remedies. He is the mercantile owner of the bill, but
in order to establish his ownership he must show a mercantile
title. The bill must be negotiated to him, that is to say, it must
be transferred to him according to the forms prescribed by
mercantile law. If the bill is payable to order, he must not only
get possession of the bill, but he must also obtain the indorse-
ment of the previous holder. If the bill is payable to bearer it
is transferable by mere delivery. A bill is payable to bearer
which is expressed to be so payable, or on which the only or
last indorsement is an indorsement in blank. If a man lawfully
obtains possession of a bill payable to order without the necessary
indorsement, he may obtain some common law rights in respect
of it, but he is not the mercantile owner, and he is not technically the holder or bearer. But to get the full advantages of mercantile ownership the holder must be a "holder in due course"—that is to say, he must satisfy three business conditions. First, he must have given value, or claim through some holder who has given value. Secondly, when he takes the bill, it must be regular on the face of it. In particular, the bill must not be overdue or known to be dishonour. An overdue bill, or a bill which has been dishonoured, is still negotiable, but in a restricted sense. The transferee cannot acquire a better title than the party from whom he took it (§ 36). Thirdly, he must take the bill honestly and without notice of any defect in the title of the transferor,—as, for instance, that the bill or acceptance had been obtained by fraud, or threats or for an illegal consideration. If he satisfies these conditions he obtains an indefeasible title, and can enforce the bill against all parties thereto. The act substitutes the expression "holder in due course" for the somewhat cumbersome older expression "bona fide holder for value without notice." The statutory term has the advantage of being positive instead of negative. The French equivalent " tiers parti de bon foi " is expressive. For foreign exchange, the holder is on a different footing from a mere holder of title. A signature, as a general rule, is a nullity. A person who claims through a forged signature has no title himself, and cannot give a title to any one else (§ 24). Two exceptions to this general rule require to be noted. First, a banker who in the ordinary course of business pays a demand draft held under a forged indorsement is protected (§ 60). Secondly, if a bill be issued with material blanks in it, any person in possession of it has prima facie authority to fill them up, and if the instrument when complete gets into the hands of a holder in due course the presumption becomes absolute. As between the immediate parties the transaction may amount to forgery, but the holder in due course is protected (§ 20).

Dishonour.—The holder of a bill has special duties which he must fulfil in order to preserve his rights against the drawers and indorsers. They are not absolute duties; they are duties to use reasonable diligence. When a bill is payable after sight, presentation for acceptance is necessary in order to fix the maturity of the bill. Accordingly the bill must be presented for acceptance within a reasonable time. When a bill is payable on demand it must be presented for payment within a reasonable time. When it is payable at a future time it must be presented on the day that it is due. If the bill is dishonoured the holder must notify promptly the fact of dishonour to any drawer and indorser he wishes to charge. If, for example, the holder only gives notice of dishonour to the last indorser, he could not sue the drawer unless the last indorser or some other party liable has duly sent notice to the drawer. When a foreign bill is dishonoured the holder must cause it to be protested by a notary public. The bill must be noted for protest on the day of its dishonour. If this be duly done, the protest, i.e. the formal notarial certificate attesting the dishonour, can be drawn up at any time as of the date of the noting. A dishonoured inland bill may be noted, and the holder can recover the expenses of noting, but no legal consequences attach thereto. In practice, however, noting is usually accepted as showing that a bill has been duly presented and has been dishonoured. Sometimes the drawer or indorser has reason to expect that the bill may be dishonoured by the drawee. In that case he may insert the name of a "referee in case of need." But whether he does so or not, when a bill has been duly noted for protest, any person may, with the consent of the holder, intervene for the honour of any party liable on the bill. If the bill has been dishonoured by non-acceptance it may be "accepted for honour supra protest." If it has been dishonoured by non-payment it may be paid supra protest. When a bill is thus paid and the proper formalities are complied with, the person who pays becomes invested with the rights and duties of the holder so far as regards the party for whom honour he has paid the bill, and all parties antecedent to him (§§ 65 to 68).

Discharge.—Normally a bill is discharged by payment in due course, that is to say, by payment by the drawee or acceptor to the holder at or after maturity. But it may also be discharged in other ways, as for example by coincidence of right and liability (§ 61), voluntary renunciation (§ 62), cancellation (§ 63), or material alteration (§ 64).

Conflict of Laws.—A bill of exchange is the most cosmopolitan of all contracts. It may be drawn in one country, payable in another, and indorsed on its journey to its destination in two or three more. The laws of all these countries may differ. Provision for this conflict of laws is made by § 72, which lays down rules for determining by what law the rights and duties of the various parties are to be measured and regulated. Speaking broadly, these rules follow the maxim Locus regi octum. A man must be expected to know and follow the law of the place where he conducts his business, but no man can be expected to know the laws of every country through which a bill may travel. For safety of transmission from country to country bills are often made out in sets. The set usually consists of three counterparts, each part being numbered and containing a reference to the other parts. The whole set then constitutes one bill, and the drawee must be careful only to accept one part, otherwise if it is dishonoured any of the other parts of the bill are to be presented. If a holder, or a holder for whom the bill is indorsed, should have presented the bill twice (§ 71), Foreign bills circulating through different countries have given rise to many intricate questions of law. But the subject is perhaps one of diminishing importance, as in many trades the system of "cable transfers" is superseding the use of bills of exchange.

A cheque "is a bill of exchange drawn on a banker payable on demand" (§ 73). For the most part the rules of law applicable to bills payable on demand apply in their entirety to cheques. But there are certain peculiar rules relating to the latter which arise from the fact that the relationship of banker and customer subsists between the drawer and drawee of a cheque. For example, when a person has an account at a bank he is, as an inference of law, entitled to draw on it by means of cheques. A right to overdraft, can, of course, only arise from agreement. The drawer of a cheque is not absolutely discharged by the holder's omission to present it for payment within a reasonable time. He is only discharged to the extent of any actual damage he may have suffered through the delay (§ 74). Apart from any question of delay, a banker's authority to pay his customer's cheques is determined by countermand of payment or by notice of the customer's death (§ 75). Of recent years the use of cheques has enormously increased, and they have now become the normal machinery by which all but the smallest debts are discharged. To guard against fraud, and to facilitate the safe transmission of cheques by post, a system of crossing has been devised which makes crossed cheques payable only through certain channels. The first act which gave legislative recognition to the practice of crossing was the 19 and 20 Vict. c. 95. That act was amended in 1858, and a consolidating and amending act was passed in 1876. The act of 1876 is now repealed, and its provisions are re-enacted with slight modifications by §§ 76 to 82 of the Bills of Exchange Act 1883. A cheque may be crossed either "generally" or "specially." A cheque is crossed generally by drawing across it a parallel line and writing between them the words " & Co." When a cheque is crossed generally it cannot be paid over the counter. It must be presented for payment by a banker. A cheque is crossed specially by adding the name of the banker, and then it can only be presented through that particular banker. A cheque, whether crossed generally or specially, may further be crossed with the words "not negotiable." A cheque crossed "not negotiable" is still transferable, but its negotiable quality is restricted. It is put on pretty much the same footing as an overdue bill. The person who takes it does not get, and cannot give a better title to it, than that which the person from whom he took it had. These provisions are supplemented by provisions for the protection of paying and collecting bankers who act in good faith and without negligence. Suppose that a cheque payable to bearer, which is crossed generally and with the words "not
negotiable," is stolen. The thief then gets a tradesman to cash it for him, and the tradesman gets the cheque paid on presentation through his banker. The banker who pays and the banker who receives the money for the tradesmen are protected, but the tradesmen would be liable to refund the money to the true owner. Again, assuming payment of the cheque to have been stopped, the tradesman could not maintain an action against the drawer.

A promissory note is defined by section 83 of the act to be an "unconditional promise in writing made by one person to another, signed by the maker, engaging to pay on demand, or at a fixed or determinable future time, a sum certain in money to or to the order of a specified person or to bearer." A promissory note may be made by two or more makers, and they may be liable either jointly, or jointly and severally, according to its tenor (§ 83). For the most part, rules of law applicable to a bill of exchange apply also to a promissory note, but they require adaptation. A note differs from a bill in this: it is a direct promise to pay, and not an order to pay. When it issues it bears it on the engagement of the principal debtor who is primarily liable thereon. The formula for applying to notes the rules as to bills is that "the maker of a note shall be deemed to correspond with the acceptor of a bill, and the first indorser of a note shall be deemed to correspond with the drawer of a bill payable to drawer's order" (§ 89). Rules relating to presentment for acceptance, acceptance, acceptance supra protest, and bills in a set, have no application to a note. Moreover, when a foreign note is dishonoured it is not necessary, for English purposes, to protest it. All promissory notes are, under the Stamp Act 1891, subject to an ad valorem stamp duty. Inland notes must be on impressed stamp paper. Foreign notes are stamped with adhesive stamps. For ordinary legal purposes a bank note may be regarded as a promissory note made by a banker payable to bearer on demand. It is subject to special stamp regulations. It is not discharged by payment, but may be re-issued again and again. In the interests of the currency the issue of bank notes is subject to various statutory restrictions. A bank, other than the Bank of England, may not issue notes in England unless it had a lawful note issue in 1844. On the other hand, Bank of England notes are legal tender except by the bank itself.

In fundamental principles there is general agreement between the laws of all commercial nations regarding negotiable instruments. As Mr Justice Story, the great American lawyer, says: "The law respecting negotiable instruments may be truly declared, in the language of Cicero, to be in a great measure not the law of a single country only, but of the whole commercial world. Non est lex alia Romae, alia Athenis, alia nunc alia posthac, sed et apud omnes gentes et omni tempore, una eademque lex obtinet" (Swift v. Tyson, 16 Peters 1). But in matters of detail each nation has impressed its individuality on its own system. The English law has been developed gradually by judicial decision founded on trade custom. French law was codified in the 17th century by the "Ordonnance de 1673." The existing "Code de Commerce" amplifies but substantially adopts the provisions of the "Ordonnance." The growth of French law was thus arrested at an early period of its development. The result is instructive. A reference to Marius' treatise on bills of exchange, published about 1670, or Beaves' Lex Mercatoria, published about 1740, shows that the law, or rather the practice, as to bills of exchange was even then fairly well defined. Comparing the practice of that time with the law as it now stands, it will be seen that it has been modified in some important respects. For the most part, where English law differs from French law the latter is in strict accordance with the rules laid down by Beaves. The fact is that, when Beaves wrote, the law or practice of both nations on this subject was nearly uniform. But English law has gone on growing while French law has stood still. A bill of exchange in its origin was an instrument by which a trade due in one place was transferred to another place. This theory French law rigidly keeps in view. In England bills have developed into a paper currency of perfect flexibility. In France a bill represents a trade transaction; in England it is merely an instrument of credit. English law affords full play to the system of accommodation paper; French law endeavours to stamp it out. A comparison of some of the main points of difference between English and French law will show how the two theories work. In England it is no longer necessary to express on a bill that value has been given for it, for the law raises a presumption to that effect. In France the nature of the consideration must be stated, and a false statement of value avoids the bill in the hands of all parties with notice. In England a bill may be drawn and payable in the same place. In France the place where a bill is drawn should be so far distant from the place where it is payable that there may be a possible rate of exchange between the two. This so-called rule of distant loci is said to be disregarded now in practice, but the code is unaltered. As French lawyers put it, a bill of exchange necessarily presupposes a contract of exchange. In England since 1675 a bill may be drawn payable to bearer, though formerly it was otherwise. In France it must be payable to order; if it were not so it is clear that the rule requiring the consideration to be truly stated would be a nullity. In England a bill originally payable to order becomes payable to bearer when indorsed in blank. In France an indorsement in blank merely operates as a procuration. An indorsement, to operate as a negotiation, must be to order, and must state the consideration; in short, it must conform to the conditions of an original draft. In England, if a bill is dishonoured by non-acceptance, a right of action at once accrues to the holder. In France no cause of action arises unless the bill is again dishonoured at maturity; the holder in the meantime is only entitled to demand security from the drawer and indorsers. In England a sharp distinction is drawn between current and overdue bills. In France no such distinction is drawn. In England no protest is required in the case of the dishonour of an inland bill, notice of dishonour being sufficient. In France every dishonoured bill must be protested. Opinions may differ whether the English or the French system is better calculated to serve sound commerce and promote a healthy commercial morality. But an argument in favour of the English system may be derived from the fact that as the various continental codes are from time to time revised and re-enacted, they tend to depart from the French model and to approximate to the English rule. The effect upon English law of its codification has yet to be proved. A common objection to codification in England is that it deprives the law of its elastic character. But when principles are once settled common law has very little elasticity. On the other hand no code is final. Modern parliaments legislate very freely, and it is a much simpler task to alter statute law than to alter common law. Moreover, legislation is cheaper than litigation. One consequence of the codification of the English law relating to bills is clear gain. Nearly all the British colonies have adopted the act, and where countries are so closely connected as England and her colonies, it is an obvious advantage that their mercantile transactions should be governed by one and the same law expressed in the same words.

The ordinary text-books on the law of bills of exchange are constantly re-edited and brought up to date. The following among others may be consulted: Beaves' Bills of Exchange; Chalmers, Bills of Exchange; Daniel, Law of Negotiable Instruments (United States); Nougier, Des lettres de change et des effets de commerce (France); Thorburn, Bills of Exchange Act 1882 (Scotland); Story, Bills of Exchange (United States); Hodgins, Bills of Exchange Act 1850 (Canada).

BILL OF RIGHTS, an important statute in English constitutional history. On the 13th of February 1689 the Declaration of Right, a document drawn up by a committee of the commons, and embodying the fundamental principles of the constitution, was delivered by the lords and commons to the prince and princess of Orange, afterwards William III. and Mary. In
December 1689 the rights claimed by the declaration were enacted with some alterations by the Bill of Rights, next to Magna Carta, the greatest landmark in the constitutional history of England and the nearest approach to the written constitution of other countries. The Act (the full name of which is An Act declaring the Rights and Liberties of the Subject, and settling the Succession of the Crown), after reciting the unconstitutional proceedings of James II., the abdication of that king, the consequent vacancy of the crown, and the summons of the convention parliament, declared, on the part of the lords and commons, “for the vindicating and asserting their ancient rights and liberties” —

“1. That the pretended power of suspending laws or the execution of laws by regal authority without consent of parliament is illegal. (2) That the pretended power of dispensing with laws or the execution of laws by regal authority, or the tune of laws in any other manner than the same is or shall be granted, is illegal. (3) That the commission for erecting the late court of commissioners for ecclesiastical causes, and all other commissions and courts of like nature, are illegal and pernicious. (4) That levying money for or to the use of the crown, by pretence of any prerogative, without grant of parliament, for longer time in or other manner than the same is or shall be granted, is illegal. (5) That it is the right of the subjects to petition the king, and all commitments and prosecutions for such petitioning are illegal. (6) That no contrary construction shall be given to this act, whereby ministers of parliament may in time of peace, unless it be with consent of parliament, be against law. (7) That the subjects which are Protestants may have arms for their defence suitable to their conditions, and as allowed by law. (8) That elections of members of parliament be free. (9) That the freedom of speech, and debates or proceedings in parliament, ought not to be impeached or questioned in any court or place out of parliament. (10) That excessive bail ought not to be required, nor excessive fines imposed, nor cruel and unusual punishments inflicted. (11) That juries ought to be duly impanelled and returned, and jurors which pass upon men in trials for high treason ought to be freeholders. (12) That all grants and promises of fines and forfeitures of particular persons before conviction are illegal and void. (13) That the offenses and aggravations of misprision of the laws, and amending and strengthening of the laws, parliament ought to be held frequently. (14) And they do claim, demand and insist upon all and singular the premises, as their undoubted rights and liberties.”

The further provisions of the act were concerned with the settlement of the crown upon the prince and princess of Orange, with the exception of § 12, which negatived the right of dispensation by non obstante 1 to or of any statute or any part thereof, unless a dispensation be allowed in the statute itself or by bill or bills to be passed during the then session of parliament.

It is to be noticed that the Declaration of Right and the Bill of Rights introduced no new principle into the English constitution; it was merely a declaration of the rights as it stood in the United States, the same provisions of the Bill of Rights, so far as they are applicable, have been adopted both in the constitution of the United States and in the state constitutions.

BILL OF SALE, in its original sense, a legal document assigning personal property, and still used in connexion with the transfer of property in ships. The term has come to be applied to mortgages as well as to sales, and the expression “bill of sale” may now be understood to signify generally a document evidencing a sale or mortgage of personal chattels. The first English legislation on the subject was the Bills of Sale Act 1854, which, after reciting that “frauds were frequently committed upon creditors by secret bills of sale of personal chattels, whereby persons are enabled to keep up the appearance of being in good circumstances and possessed of property, and the grantees or holders of such bills of sale have the power of taking possession of the property of such person to the exclusion of the rest of their creditors,” provided that all bills of sale, as defined in the act, should be void against execution creditors unless registered. This act was amended by the Bills of Sale Act 1866. These acts were repealed and a new act passed, the Bills of Sale Act 1878, which, in the main, followed the lines of the act of 1854. The scope of this legislation was widened by the Bills of Sale Act (1878) Amendment Act 1882, which was intended primarily “to prevent needy persons being entrapped into signing complicated documents which they might otherwise be unable to comprehend, and so being subjected by their creditors to the enforcement of harsh and unreasonable provisions.”

The law is now regulated by these two acts, together with the Bills of Sale Acts of 1888 and 1891, which effected further small amendments by excluding from the operation of the principal acts instruments hypot hectizing, charging or declaring trusts on imported goods, during the interval between their unloading from a ship and their deposit in a warehouse, or re-shipping.

Under the acts of 1878 and 1882 bills of sale are of two kinds, i.e. absolute bills of sale (where chattels are sold absolutely to a purchaser), and bills of sale by way of security for the payment of money. The Bills of Sale Act 1878 governs both kinds and is the only act which applies to absolute bills. Bills of sale given by way of security for the payment of money on or after the 1st of November 1882 are governed by the act of 1882, which, however, does not apply to absolute bills. Section 4 of the act of 1878 defines a bill of sale as (1) including bills of sale, assignments, transfers, declarations of trust without transfer, inventories of goods with receipt thereto attached, or receipts for purchase money of goods and other assurances of personal chattels; the term assurance has been best explained as a document “on which the title of the transferee of the goods depends, either as the actual transfer of the property, or an agreement to transfer,” Marsden v. Meadows, 1881, q B.D. 86; (2) powers of attorney, authorities or licences to take possession of the chattels as security for any debt; these words would not include a power of distress for rent in an ordinary lease or bona fide hiring or hire purchase agreements; (3) any agreement, whether intended or not to be followed by the execution of any other instrument, by which a right in equity to certain personal chattels, or to any charge or security thereon, shall be conferred; (4) any mode of disposition of trade machinery and other goods or instruments giving powers of distress to secure a debt or advance. On the other hand, certain assurances and instruments are expressly exempt by statute from the definition: marriage settlements, assignments of ships, assignments for the benefit of creditors, bills of lading and charter parties, and the act of 1882, debentures and debenture stock of a company. The expression “personal chattels” is defined as goods, furniture and other articles capable of complete transfer by delivery, and (when separately assigned or charged) fixtures and growing crops.

Absolute Bills.—Absolute bills of sale must be duly attested by a solicitor, and the attestation must state that before execution there were no other bills of sale or mortgage in any part thereof. The consideration must be truly stated. The bill of sale and all schedules and inventories annexed to or referred to in the bill, and also a true copy of the bill and of every schedule and inventory and of every attestation, together with an affidavit stating the time of execution of giving the bill, its due execution and attestation and the residence and occupation of the grantor, and every attesting witness, must be presented to, and the copies filed by, the registrar within seven clear days. In the case of absolute bills the effect of non-execution or non-payment would be a demolition of the bill as between the parties to it, but it makes void as against the trustee in bankruptcy and execution creditors of the grantor.

Bills by Way of Security.—All bills of sale given by way of security for the payment of money must be in the form given in the schedule to the act of 1882, and they must not depart from the statutory form in anything which is not merely of a matter of verbal difference. The form given in the schedule to the act is as follows:

This indenture made the day of between A. B. of the one part and C. D. of the other part, witnesseth that in consideration of the sum of £0, now paid to A. B. by C. D., the receipt of which said sum is hereby acknowledged, A. B. doth hereby assign into C. D.'s executors, administrators and assigns all and singular the several chattels and things specifically described in the schedule hereto annexed by way of security for the payment of the sum of £0, and interest thereon at the rate of 5% per annum. And the said A. B. doth further agree and declare that he will duly pay to the said C. D. the principal sum aforesaid together with the interest then due, by equal payments of £0, on the day of

And the said A. B. doth also agree with the said C. D. that he will (here insert terms as to insurance, payment, &c.)

1 Non obstante (notwithstanding) means a licence from the crown to do that which could not be lawfully done without it.
which the parties may agree to for the maintenance or defeasance of the security). Provided always that the chattels hereby assiged shall not be liable to seizure or to be taken possession of by the said C. D., for any cause other than those specified in § 7 of the Bills of Sale Act (1897) Amendment Act 1882.

In witness whereof &
Signed and sealed by the said A. B. in the presence of me E. F. (add witness's name, address and description).

Non-compliance with the requirements of the statute as to form renders a bill of sale taken as such within seven clear days after the time must have annexed to it an inventory of the chattels comprised in it, and it is void, except as against the grantor, in respect of any personal chattels not specifically described. It must be duly attested by one or more credible witnesses (not necessarily by the grantor) as any personal chattels of which he is not the true owner, the bill is void, except as against the grantor. Every bill of sale made or given in consideration of any sum under £30 is void. By § 7 of the act personal chattels shall only be liable to be seized or taken possession of by the following parties:

(1) the grantor in default of payment of the debt or in the performance of any covenant or agreement contained in the bill and necessary for maintaining the security;

(2) if the grantor becomes a bankrupt or suffers the goods to be distrained for rent, rates or taxes, the bankrupt or his assignee immediately removes the goods from the premises;

(3) if the grantor does not, without reasonable excuse, upon demand in writing by the grantee, produce to him his last accounts for rent, rates or taxes;

(4) if the instrument is levied against the goods by any judgment.

By § 13 personal chattels seized or taken possession of under a bill must not be removed or sold after the expiration of five clear days from the date of seizure, and, if the goods are not seen and valued before the expiration of those days, the grantor must within five days apply to the High Court or a judge in chambers for an order to restrain the grantee from removing or selling the goods. The Bills of Sale Acts 1878 and 1882 do not apply to Scotland or Ireland. According to the Stamp Act, every security for the sale of goods is capable of being enforced without delivery of possession. The Irish statutes corresponding to the English Acts (Ireland) Act 1879 and the Amendment Act 1883.

The stamp duties payable on an absolute bill of sale are 2s. 6d. on every £25 secured up to £300; over £300, 5s. for every £50. On bills of sale by way of security, 1s. 3d. for every £50 up to £300 secured; over £300, 2s. 6d. for every £100. The fees payable on filing a bill of sale are, 5s. for the consideration (including further advances) does not exceed £100; above £100 and not exceeding £500, 10s.; above £500, £1.

The various trade protection papers always publish the registration of a bill of sale, and the usual effect is, therefore, to make the goods incapable of being sold or mortgaged by the owner (T. A. L.).

BILLOTH, ALBERT CHRISTIAN THEODOR (1829–1894).

Viennese surgeon, was born on the 26th of April 1829 at Bergen, on the island of Rügen, his family being of Swedish origin. He studied at the universities of Greifswald, Göttingen and Berlin, and after taking his doctor's degree at the last in 1852, started on an educational tour, in the course of which he visited the medical schools of Vienna, Prague, Paris, Edinburgh and London. On his return to Berlin he acted as assistant to B. R. K. Langenbeck from 1853 to 1860, and then accepted the professorship of surgery at Zürich. In 1867 he was invited to fill the same position in Vienna, and in that city the remainder of his professional life was spent. In 1887 he received the distinction, rarely bestowed on members of his profession, of a seat in the Austrian Herrschaft. He died at Abbadia, on the Adriatic, where he had a beautiful villa, on the 6th of February 1894. Billoth was one of the most distinguished surgeons of his day. His boldness as a surgeon or even in the treatment of cases requiring intervention could not have lessened, and even an accident or emergency could disturb his coolness and presence of mind, and his ability to invent or carry out any new procedure that might be demanded in the particular case with which he was dealing, gained for him the appellation of "surgeon of great initiatives." At the same time he was full of consideration for the comfort and well-being of his patient, and never forgot that he had before him a human being to be relieved, not a mere "case" for the display of technical dexterity. He was especially interested in military surgery, and during the Franco-German War volunteered to serve in the hospitals of Mannheim and Weissenburg. His efforts did much to improve the arrangements for the transport and treatment of the wounded in war, and in a famous speech on the War Budget in 1891, he eloquently urged the necessity for an improved ambulance system, pointing out that the use of smokeless powder and the greater precision of the arms of modern warfare must tend to increase the number of men wounded, and that therefore more efficient means must be provided for removing them from the battlefield. Possessing a clear and graceful style, he was the author of numerous papers and books on medical subjects; his Allgemeine chirurgische Pathologie und Therapie (1863) ran through many editions, and was translated into many languages. He was of an exceedingly artistic disposition, and in particular was devoted to music. A good performer on the pianoforte and violin, he was an intimate friend and admirer of Brahms, many of whose compositions were privately performed at his house before they were published. His work on the physiology of music (Wer ist musikalisch?) was published after his death.

BILMA, or KAWAR, an oasis in the heart of the Sahara desert, some 60 m. long by 10 broad. The inhabitants are Tibbu and Kanuri. The name Bilma is properly confined to the southern part of this region, where is the chief settlement, called Bilma or Garu. This place is 800 m. due S. of the town of Tripoli and about 350 N. of the N.W. corner of Lake Chad. In the vicinity are a number of lakes, the waters of which on evaporation yield large quantities of very pure and fine salt, which is the object of an extensive trade with the countries of Central Africa. North of Bilma is the town of Dirki, said to date from the 11th century. Near Bilma is a small circular oasis, kept green by a fine spring, but immediately to the south begins the most dreary part of the Saharan desert, over which the caravans travel for fifteen days without discovering the slightest trace of vegetable life. Gustav Nachtigal, who visited Bilma in 1876, records that the temperature during the day rarely sank below 113° Fahr. By the Anglo-French Declaration of the 21st of March 1899 Bilma was included in the French sphere of influence in West Africa. Turkey claimed the oasis as part of the hinterland of Tripoli and garrisoned Bilma in 1902. In 1906, however, a French force from Zinder occupied the town, no opposition being offered by the Ottoman authorities. In 1907 the oasis and surrounding district was created a circle of the Military Territory of the Niger (see SAHARA).

BILNEY, THOMAS (d. 1531), English martyr, was born at or near Norwich. The exact date of his birth is uncertain, but at all events it was not before 1495. He was educated at Trinity Hall, Cambridge, graduating L.L.B. and taking holy orders in 1516. After a period of residence in the Gray's Inn, the schoolmen, he turned his attention to the edition of the New Testament published by Erasmus in 1516. "Immediately," he records, "I felt a marvellous comfort and quietness." The Scriptures now became his chief study, and his influence led other young Cambridge men to think along the same lines. Among his friends were Matthew Parker, the future archbishop of Canterbury, and Hugh Latimer. Latimer, previously a strenuous conservative, was completely won over, and a warm friendship sprang up between him and Bilney. "By his confession," said Latimer, "I learned more than in twenty years before." In 1525 Bilney obtained a licence to preach throughout the diocese of Ely. He denounced saint and relic worship, together with pilgrimages to Walsingham and Canterbury, and refused to accept the mediæval feastings of the saints. The diocesan authorities raised no objection, for, despite his reforming views in these directions, he was to the last perfectly orthodox on the power of the pope, the sacrifice of the mass, the doctrine of transubstantiation and the authority of the church. But Wolsey took a different view. In 1526 he appears to have summoned Bilney before him. On his taking an oath that he did not hold and would not disseminate the doctrines of Luther, Bilney was dismissed. But in the following year serious objection was taken to a series of sermons preached by him in and near London, and he was arrested and imprisoned in the Tower. Arraigned before Wolsey, Warham, archbishop of Canterbury,
and several bishops in the chapter-house at Westminster, he was convicted of heresy, sentence being deferred while efforts were made to induce him to recant, which eventually he did. After being kept for more than a year in the Tower, he was released in 1539, and went back to Cambridge. Here he was overcome with remorse for his apostasy, and after two years determined to preach again what he had held to be the truth. The churches being no longer open to him, he preached openly in the fields, finally arriving in Norwich, where the bishop, Richard Nix, caused him to be arrested. Articles were drawn up against him by Convocation, he was tried, degraded from his orders and handed over to the civil authorities to be burned. The sentence was carried out in London on the 10th of August 1531. A parliamentary inquiry was threatened into this case, not because parliament approved of Bilney’s doctrine but because it was alleged that Bilney’s execution had been obtained by the ecclesiastics without the proper authorization by the state. In 1534 Bishop Nix was condemned on this charge to the confiscation of his property. The significance of Bilney’s execution lies in the fact that on essential points he was an orthodox Roman Catholic.

(A. F. P.)

BILLOXI, a city of Harrison county, Mississippi, U.S.A., in the south part of the state, on Biloxi Bay, a branch of the Mississippi Sound, which is a part of the Gulf of Mexico. By rail it is 80 m. N.E. of New Orleans and 61 m. S.E. of Mobile, Alabama. Pop. (1850) 1540; (1860) 3234; (1900) 4676 (949 being negroes and 453 foreign-born); (1910) 7088. The city is served by a branch of the Louisville & Nashville railway, and by an electric railway extending to Bay St. Louis, through Gulfport (pop., 1900, 1060; 1910, 6386), 13 m. S.W., the port of entry of the Pearl River customs district, whose exports, chiefly timber, lumber, naval stores and coal, were valued at $5,302,271 in 1907. Biloxi is both a summer and a winter resort, particularly for the people of New Orleans and Mobile, and has a fine beach, extending for about 12 m. around its peninsula, and bordered by an automobile drive; along the beach are some attractive residences, hotels and boarding houses, and several sanatoriums. The city’s principal industries are the canning of oysters, shrimp, fish, figs and vegetables, and the manufacture of fertilizers and flour. A beautiful thin-fallen remarkable metallic glazes is made here. The municipality owns the waters, the water being obtained from artesian wells. Pierre le Moyne d’Iberville (1661-1706) in 1699 built Fort Maurepas across the bay from the present city; and the settlement there, called Biloxi after the Biloxi Indians, was the first to be established by the French in this region. In 1702 this post, known as Old Biloxi, was abandoned, and the seat of government was removed to the Mobile river. In 1712 a settlement was made on the present site, being the first permanent settlement within what is now the state of Mississippi. Many of the early settlers were French Canadians, who came down the Mississippi to join the new colony. Biloxi was again the capital from 1719 until 1722. It was incorporated as a village in 1872, and was chartered as a city in 1896.

BILTON, a market town of Staffordshire, England, 2½ m. S.E. of Wolverhampton and 124 N.W. of London, in the Black Country. Pop. of urban district (1901) 24,034. It is served by the Great Western railway, and by the London & North-Western at Ettingshall Road station. In the vicinity are very productive mines of coal and ironstone, as well as sand of fine quality for casting, and grinding-stones for cutters. Bilston contains numerous furnaces, forges, rolling and slitting mills for the preparation of iron, and a great variety of factories for japanned and painted goods, brass-work and heavy iron goods. Though retaining no relics of antiquity, the town is very ancient, appearing in Domesday. The parish church of St Leonard, dating as it stands mainly from 1827, is on the site of a building of the 13th century. Bilston suffered severely from an outbreak of cholera in 1832. The town is within the parliamentary borough of Wolverhampton.

BIMANA, (Lat. “two-handed”), a word first used by the naturalist Johann Friedrich Blumenbach to distinguish the order of man from Quadruped or other mammals. The term was popularized by Cuvier, and the majority of writers followed him in its adoption. In 1865, however, Huxley in his Man’s Place in Nature demonstrated that the higher apes might fairly be included in Bimana. Again and again it has been proved that the human great toe can be by constant practice used as a thumb; artists exist who have painted pictures grasping the brush with their toes, and violinists have been known to play their instruments in the same manner. Among many savage races there is developed a remarkable power of foot-grasp, which in a lesser degree is often so noticeable among sailors. Haecell calls attention to the fact that a baby can hold a spoon with the big-toe as with a thumb. Man, in a word, is potentially quadrumanous.

BIMETALLISM. The very general employment of both gold and silver for currency purposes (see Money) has given rise to serious practical difficulties which have in turn led to keen theoretical discussion as to the proper remedies to be employed.

Though every arrangement under which two metals form the money of a region may be described as “bimetallism,” the term—as often happens in economics—has received a specialized meaning. It denotes a system under which the two metals are freely received by the mint and are equally available as legal tender. The last clause implies the establishment of a definite ratio in value between the two metals (e.g. 1 oz. of gold = 153 oz. of silver) so that the title “rated bimetallism” may be given it, in contradistinction to the “unrated bimetallism” which exists wherever two metals circulate together, but have their relative values determined, not by law, but by “the higgling of the market.” Further, the inventor of the term—H. Cermuschi in 1869—regarded it as properly applicable to an international arrangement by which a number of states agree to adopt the same ratio, rather than to the use of the two metals by a single country, which may be described as national bimetallism. International bimetallism is at all events the form which has attracted attention in recent times, and it is certainly the most important.

Regarded from the historical point of view it appears that the failure of separate countries to maintain the two metals in circulation was the cause which produced the idea of bimetallism as an international system. We find first the upholders of a national double standard, as in France and the United States, and these are followed by the advocates of bimetallism set up by a combination of countries. The theoretical considerations which underlie the controversy between the supporters and the opponents of bimetallism find their appropriate place in the article Money, as does also the earlier history of the double standard. The circumstances that have led to the prominence of the bimetallic question and the principal events that have marked the course of the movement form the subject of this article.

In the earlier years of the 19th century, when the monetary disturbances that resulted from the Revolutionary wars had ceased, we find France (1803) and the United States (1792) with the double standard legally established. England, on the other hand, had in 1816 accepted by law the gold standard, which had come into use in the 18th century. Silver formed the currency of the other European countries. The great discoveries of gold in California (1848) and Australia (1851) brought about the displacement of silver by gold in France, and the continuance of gold as the principal currency metal in the United States, where by the law of 1834 it had been somewhat over-rated (1:10), as compared with the ratio adopted in France (1:153), and had therefore expelled most of the silver previously in circulation. Between 1848 and 1860 over 10,000,000 oz. of gold was coined in France, while an equivalent amount of silver was exported, principally to the East.

At this time the weight of economic and official opinion was very decidedly in favour of the single gold standard as the best system. In 1865 the Latin Union was established, in which the French currency system was adopted and was followed by the
international conference of 1867 in Paris (see Monetary Conferences), when gold was unanimously accepted as the standard for the proposed international system to be produced by co-ordinating the various currencies with that of the Latin Union.

A series of political and economic events speedily changed this situation. The Franco-German War (1870-71) depressed France from her leading position, and led to the establishment of a German gold currency with a different unit from the franc, accompanied by the demonetization of the silver currencies previously in use in the German states. The United States, where an inconvertible paper currency had been introduced during the Civil War, formally established the gold dollar as the standard coin (1873) and arranged for a return to specie payments (1878). At this time, too, the great production of gold which had marked the period 1850-1870 diminished, while very productive silver mines were discovered in the Pacific states of America. As a result of these combined influences the gold price of silver, which had risen a little during the height of the gold discoveries, began to fall rapidly, and the reverse process to that by which France had in the 'fifties acquired a gold currency came into operation. Silver, in accordance with Gresham's Law, was imported and offered for coinage. To obviate this the policy of limiting the coinage of silver, the money of account was adopted by the Latin Union. A further fall in the gold price of silver naturally resulted, and this made the position of Eastern trade and the finances of the Indian government insecure. American silver producers, and the German government, as holders of a large mass of demonetized silver, were also sufferers by the depreciation. The effect on public and official opinion was shown by the English parliamentary committee on the depreciation of silver (1876), the American silver commission of the same year, and the appearance of many works on the subject, most of them advocating the double standard. On the initiative of the United States an international monetary conference met in Paris in 1878, but though the necessity of keeping a place for silver in the money of the world was recognized, the proposal to adopt the double standard for general use was rejected by the European states. By the Bland-Allison Act (Feb. 1878) the United States had provided for the coinage of a certain amount of silver per month as a mode of keeping up the price of the metal, which notwithstanding fell to 38½ pence per oz. in 1879. The prolonged depression of trade in America and Gerald sunken to a further scarcity of the money of account was described as "the outlawry of silver." By the joint action of France and the United States a fresh monetary conference was held in Paris in 1881, where the advocates of bimetallism were very strongly represented. After prolonged discussion no conclusion was reached, in consequence of the refusal of England and Germany to abandon the gold standard. Though an adjournment to the following year was resolved on, the conference did not reassemble, and the bimetallist movement took the form of agitation, carried on in every country. The English inquiry into the depression of trade (1885-1886) drew from the commission a recommendation for a fresh commission to investigate the relation of gold and silver. This latter body, appointed in 1886, obtained a great body of important evidence, and in 1888 closed its work by a report in which the views of the two sections of the commission were separately presented. Six members supported the existing gold standard and six were in favour of the bimetallist system. This inconclusive result was soon followed in the United States by the Sherman Act (1890), providing for a larger monthly coinage of silver. A temporary rise in the price of the metal was followed by a further fall, making the situation still more critical. A new monetary conference was summoned by the United States and met in Brussels in November 1892. To modify opposition the "desirability of increasing the use of silver" was the resolution proposed; the actual method being left open. This conference also proved abortive and adjourned to 1893, but like that of 1881 did not meet again.

International action having failed to secure any system of bimetallism, the United States and India sought to relieve their position by local legislation. The former repealed the Sherman Act, and the latter closed its mints to the free coinage of silver (1893). As these measures were opposed to bimetallism in that they restricted the use of silver, and were followed by a lower price for that metal than had ever been known, the agitation in the United States and Europe continued. In America it took the form of advocating the free coinage of silver by the United States without waiting for other countries; and in this shape the principal issue at the presidential elections of 1896 and 1900, in each of which it was emphatically rejected.

A further attempt at securing international bimetallism was made by Senator Walcott's commission in 1897. The American envoy, in concert with the French government, proposed to England (1) the reopening of the Indian mints, and (2) the annual purchase by England of £1,000,000 of silver. The French minister claimed further concessions which were regarded as inadmissible by the English government; but the fate of the mission was settled by the refusal of the Indian government to reopen its mints.

After the American election of 1900, bimetallism as a popular cause disappeared from view. The silver issue was withdrawn from the democratic platform in 1904, and the bimetallist movement died out in England.

Amongst the causes of this collapse the most important are: (1) the adoption of the gold standard by so many countries—Austria-Hungary (1892), Russia and Japan (1897), India (1896), Mexico (1904)—a movement which pointed to the complete triumph of gold in the future; (2) the great increase in the output of gold. Australia and South Africa so developed their gold mines as to bring the yield for 1896 to 81,000,000 as contrasted with the less than 20,000,000 of 1883. This growing supply removed all that dread of a "gold famine" which served as a popular argument with bimetallists. To these may be added (3) the knowledge that experience has brought of the difficulties surrounding any attempt to establish a common ratio where the interests of different countries are so opposed; and (4) the great expansion of trade and industry, concomitantly with the wider adoption of the gold standard. Therefore, to quote the words of perhaps the ablest advocate of bimetallism, "The outcome of the prolonged controversy... appears to be that the commercial world will carry on its business principally and more and more on a gold basis, and that particular countries will endeavour in different ways to adjust their actual medium... to the gold standard" (Nicholson, Money and Monetary Problems, 6th ed.).

Perhaps the principal service rendered by the many able minds engaged in the movement will prove to be the fuller development of the more difficult parts of monetary theory and the additional light thrown on the course of monetary history.

A proposal, sometimes confounded with bimetallism, is that for a standard composed of both gold and silver, which is better described as the Joint-standard or as Symmetrical.

(C. F. B.)

BIMLIPATAM, a town of British India, in the Vizagapatam district of Madras, on the sea-coast 18 m. N.E. of Vizagapatam. Pop. (1901) 10,213. It was formerly a Dutch factory, and is the industrial port of the district. The anchorage is an open roadstead protected to some extent by headlands with a light-house at Santapalli. Nearly half the sea-borne trade is conducted with foreign countries. The principal exports are oil-seeds, hides and jute.

BIN, a receptacle of various kinds, originally of wicker or basket work. The word appears in most European languages, cf. M.L. and Ital. benna, Ger. Benne, &c.; etymologists trace the word to a root meaning "to plait." It survives in various
BINAN—BINIOU

connexions, e.g. dust-bin, wine-bin (for holding bottles), hop-bin, coal-bin, corn-bin.

BINAN, a town of the province of La Laguna, Luzon, Philippine Islands, on the W. shore of Laguna de Bay, about 20 m. S.S.E. of Manila. Pop. (1903) 56,635. The town is surrounded by an extensive and extremely fertile plain which produces very large quantities of rice as well as a great variety of tropical fruits, and a ready market for these products is found in Manila whither they are shipped by boat. The language is Tagalog.

BINARY SYSTEM, in astronomy, a system composed of two stars revolving around each other under the influence of their mutual attraction. A distinction was formerly made between double stars of which the components were in revolution around each other, and those in which no relative motion was observed; but it is now considered that all double stars must really be binary systems.

Bainh-Coblentzidius (d. 1460), an early 15th-century musical composer evidently born after his birthplace, Binche, near Mons. He was esteemed by contemporary and later theorists as second only to Dunstable and Dufay.

BINGEN (anc. Vinum or Bingenum), a town of Germany, in the grand-duchy of Hesse-Darmstadt, 15 m. N.W. from Mainz, on the main line to Cologne. Pop. (1895) 99,50. It is situated on the left bank of the Rhine opposite Rüdesheim, at the confluence of the Nahe (or Nava), which is crossed near its mouth by a stone bridge, attributed to Drusus, and certainly of Roman origin, and an iron railway bridge. On a height immediately to the southeast is the ruined castle of Klopp, on the site of a fortress founded by Drusus, and higher still the celebrated chapel of St Roch (rebuilt in 1395 after a fire), where thousands of pilgrims gather on the first Sunday after the 16th of August. Apart from its situation, which renders it a convenient place of tourist resort, the town itself presents few attractions. There are a Protestant and three Roman Catholic churches, among the latter the parish church with a crypt dating from the 11th century, and a medieval town hall. It has a considerable commerce in wine, grain, and cattle, and, new quays and a harbour having been recently constructed, does an extensive trade in coal and iron. A short way down the Rhine is the Bingerloch, a famous whirpool, whilst halfway between it and the town rises on a rock in the middle of the stream the Münseturm (derived from Muserie, cannon), in which, according to legend, Archbishop Hatto II. of Mainz was in 969 eaten by mice (the legend being doubtless due to the erroneous derivation from Mäuse, mice). Another legend states that the Nibelung treasure is hidden hereabouts in the Rhine.

BINGERBRUCK, a town of Germany, in the Prussian Rhine province, at the confluence of the Nahe and the Rhine, lying just below Bingen, and at the junction of the main lines of railway—Mainz-Coblentz and Bingerbruck-Mets. It has an extensive trade in the wines of the district. Pop. 25,000.

BINGHAM, JOSEPH (1668-1723). English scholar and divine, was born at Wakefield in Yorkshire in September 1668. He was educated at University College, Oxford, of which he was made fellow in 1689 and tutor in 1691. A sermon preached by him from the university pulpit, St Mary's, on the meaning of the terms "Person" and "Substance" in the Fathers, brought upon him a most unjust accusation of heresy. He was compelled to give up his fellowship and leave the university; but he was immediately appointed by Dr John Radcliffe to the rectory of Headbournewourth, near Winchester (1693). In this country retirement he began his laborious and valuable work entitled Orignes Ecclesiasticae, or Antiquities of the Christian Church, the first volume of which appeared in 1708 and the tenth and last in 1722. His design, learnedly, exhaustively and impartially executed, was "to give such a methodical account of the antiquities of the Christian Church as others have done of the Greek and Roman and Jewish antiquities, by reducing the ancient customs, usages and practices of the church under certain proper heads, whereby the reader may take a view at once of any particular usage or custom of Christians for four or five centuries." Notwithstanding his learning and merit, Bingham received no higher preferment than that of Headbournewourth till 1712, when he was collated to the rectory of Havant, near Portsmouth, by Sir Jonathan Trelawney, bishop of Winchester. Nearly all his little property was lost in the great South Sea Bubble of 1720. He died on the 17th of August 1733.

BINGHAMTON, a city and the county-seat of Broom county, New York, U.S.A., in the south part of the state, on both banks of the north branch of the Susquehanna river, at the mouth of the Chenango river. Pop. (1880) 17,317; (1890) 35,005; (1900) 39,647, of whom 4272 were foreign-born; (1910), 48,443.

It is an important railway centre, being served by the Delaware & Hudson, the Erie, and the Delaware, Lackawanna & Western railways; and an extensive system of electric railways connects it with the suburbs and neighbouring towns. Binghamton is picturesquely situated and has a number of parks, the most attractive of which are Ross Park of 100 acres and Ely Park of 134 acres. Among the principal buildings are the city hall, the court house, the post-office, the Binghamton city hospital, Stone opera-house, the Carnegie library (1904), the central high school, and a state armoury. Binghamton has also some fine office buildings. Among the city's educational and charitable institutions are the Lady Jane Grey school (for girls), St Joseph's academy, St Mary's home for orphans, the Susquehanna Valley orphan asylum, and a state hospital for the insane. Binghamton is a manufacturing centre of considerable importance, ranking twelfth in the state in 1905 in the value of factory products, $13,907,403, which was an increase of 32.6 per cent. over the value of the factory products in 1000; among its manufactures are tobacco, cigars, chewing tobacco and snuff (value in 1905, $8,790,217), patent medicines (value in 1905, $1,153,106), flour and grist mill products ($1,680,910), men's clothing ($83,835), and, of less importance, commercial and computing scales and time recorders, chemical, distilled liquor, beer, fire-alarm apparatus, overalls, agricultural implements, wagons, electrical apparatus, refined oil, sheet metal, paper bags and envelopes, tacks and nails, window glass, glass-ware, clocks, whips and furniture (especially Morris chairs).

In the village of Lestershire (pop. in 1910, 3775; incorporated in 1892), about 2 m. west, and in Endicott, another suburb, are large boot and shoe factories. The municipality owns and operates the water-works. When Binghamton was first settled, about 1787, it was known as Chenango Point. Its site was originally included in the so-called "Bingham Patent," a tract on both sides of the Susquehanna river owned by William Bingham (1751-1804), a Philadelphia merchant, who was a member of the Continental Congress in 1787-1788 and of the United States Senate in 1795-1801, being president pro tempore of the Senate from the 16th of February to the 3rd of March 1797. In 1800 a village was laid out by an agent of Mr Bingham, and it was named Binghamton. In 1834 it was incorporated as a village, and in 1867 was constituted as a city.

BINGLEY, a market town in the Otley parliamentary division of the West Riding of Yorkshire, England, on the Aire, 5 m. N.W. of Bradford, on the Midland railway. Pop. of urban district (1901) 15,449. The church of All Saints is good Perpendicular, though considerably restored. The large industrial population is engaged principally in the worsted and cotton manufacture. The neighbourhood is populous, but the natural beauty of the Aire valley is not greatly impaired.

BINIOU, or Bignou, a species of cornemuse or bagpipe, still in use at the present day in Brittany. The binioù is a primitive kind of bagpipe consisting of a leather bag inflated by means of a short valve insufflation tube or blow-pipe, a chanter with conical bore furnished with a double reed concealed within the stock or socket (see BAG-PIPE), and seven holes, the first being duplicated to accommodate left- and right-handed players.

The scale of the binioù is usually:

```
1 2 3 4 5 6 7
```

and the single drone is tuned to the lower octave of the first hole.

The more primitive biniou, still occasionally found in the remote districts of Cornouailles and Morbihan, has a chanter with but five holes, giving part of the scale of D, the drone being also tuned to D. The drone of the biniou is of boxwood, handsomely inlaid with tin, and has a single or beating reed hidden within the stock.

The word biniou or bignon (a Gallicized form), often erroneously derived from bigno, se renfer beacoup—an etymology not supported by Breton dictionaries—is the Breton plural form of benwik, Instrument, tool, i.e. bisnou, binois. The word so is also found in the phrase, "Sach ar bignon," (a biniou bag), a bag used by weavers to hold their tools, spindles, &c. The biniou is still the traditional and popular instrument of the Breton peasantry of Cornouailles and Morbihan, and is almost inseparable from the bombard (q.v.), which is no other than a survival of the medieval musette, hautbois or clairon, formerly associated with the bag-pipe in western Europe (see Ono).

At all festivals, at the pardons, wedding feasts and threshing dances, the two traditional musicians or sonneurs give out in shrill penetrating tones the ancient Breton rondes and melodies.

**BINMALEY—BINOCULAR INSTRUMENT**

most famous case, in which he was unsuccessfully opposed by Daniel Webster, was the case of Bidal v. Girard's Executors, which involved the disposition of the fortune of Stephen Girard (q.v.). Binney's argument in this case greatly influenced the interpretation of the law of charities. Binney made many public addresses, the most noteworthy of which, entitled Life and Character of Chief Justice Marshall, was published in 1835. He also published Leaders of the Old Bar of Philadelphia (1858), and an Inquiry into the Formation of Washington's Farewell Address (1850); and during the Civil War he issued three pamphlets (1861, 1862 and 1865), discussing the right of habeas corpus under the American Constitution, and justifying President Lincoln in his suspension of the writ of the.

See the Life of Horace Binney (Philadelphia, 1904), by his grandson, C. C. Binney.

**BINNEY, THOMAS** (1758-1874), English Congregationalist divine, was born of Presbyterian parents at Newcastle-on-Tyne in 1758, and educated at an ordinary day school. After spending seven years in the employ of a herring ship, he entered the theological school at Wymondley, Herts, now incorporated in New College, Hampstead. In 1829, after short pastorates at Bedford (New Meeting) and Newport, Isle of Wight, he accepted a call to the historic Weigh House chapel, London. Here he became very popular, and it was found necessary to build a much larger chapel on Fish Street Hill, to which the congregation removed in 1834. An address delivered on the occasion of the laying of the foundation stone was published, with an appendix containing a strong attack on the influence of the Church of England, which gave rise to a long and bitter controversy. Throughout his whole career Binney was a vigorous opponent of the state church principle, but those who simply classified him as a narrow-minded political disserter did him injustice. His liberality of view and breadth of ecclesiastical sympathy entitle him to rank on questions of Nonconformity among the most distinguished of the school of Richard Baxter, and he maintained friendly relations with many of the dignitaries of the Established Church. He continued to discharge the duties of the ministry until 1859, when he resigned. In 1845 he paid a visit to Canada and the United States, and in 1857-1859 to the Australian colonies. The university of Aberdeen conferred the L.L.D. degree on him in 1852, and he was twice chairman of the Congregational Union of England and Wales.

Binney was the pioneer in a much-needed improvement of the forms of service in Nonconformist churches, and gave a special impulse to congregational psalmody by the publication of a book entitled The Service of Song in the House of the Lord. Of numerous other works the best-known is his Is It Possible to Make the Best of Both Worlds? an expansion of a lecture delivered to young men in Exeter Hall, which attained a circulation of 30,000 copies within a year of its publication. He wrote much devotional verse, including the well-known hymn "Eternal Light! Eternal Light!"

His last sermon was preached in November 1873, and after some months of suffering he died on the 24th of February 1874. Dean Stanley assisted at his funeral service in Abney Park cemetery.

**BINOCULAR INSTRUMENT, or briefly Binocular,** an apparatus through which objects are viewed with both eyes. In this article only those instruments will be considered in which solid objects or objects in space are viewed; reference should be made to the article Stereoscope for the instruments in which plane representations are offered to both eyes. The natural vision is such that different central projections of the objects are communicated to both eyes; the difference of the two perspective representations arises from the fact that the projection centres are laterally separated by an interval about equal to the distance between the eyes (the inter-pupillary distance). Binocular instruments should aid the natural spatial or stereoscopic vision, or make it possible for the eyes fail. If the objects be so far

The term binocular (from the Lat. bini, two at a time, and oculi, eyes) was originally an adjective used to describe things adapted for the simultaneous use of both eyes, as in "binocular vision," "a binocular telescope or microscope," "now a binocular" is used as a noun, meaning a binocular microscope, a field-glass, &c.

1 See N. Quellen, Chansons et danses des Bretons (Paris, 1889), p. 30, and note, where the description of the instrument is not technical.

2 See Le Gondic, Dictionnaire breton-français, ed. by T. Hersart de la Villemarque; and N. Quellen, op. cit. p. 37, note.

3 For examples of these see N. Quellen, op. cit. part ii.
BINOCULAR INSTRUMENT

distant that the two perspectives formed by the naked eye are no more distinguished from each other, recourse may be had to binocular telescopes and range-finders; and if the objects be so small that, in order to observe details on them, we must bring our eyes so close to the objects that they cannot accommodate the images, recourse may be had to binocular microscopes and magnifying glasses.

The construction of binocular instruments dates back over several centuries, and has now been brought to great perfection. The subject of their theory and history has been exhaustively treated by M. von Rohr, Die binokularen Instrumente (Berlin, 1907), the first publication to present a complete account of these instruments.

**Binocular Instruments for Observation only.**—The first binocular telescope, consisting of two telescopes placed side by side, was constructed in 1506 by Johann Lipperhey, the inventor of the ordinary or Dutch telescope. The subject was next taken up by the monks. The Capuchin Antonius Maria Schyrlitus (Schyr) de Rheita (1597–1660) described in 1645 the construction of double terrestrial telescopes. Greater success attended the efforts of the Capuchin Chérubin d'Orléans, who flourished at about the same time, and constructed large double telescopes of the Dutch type of high magnification, for use in war, and smaller instruments of lower magnification; these instruments were provided with mechanism for adjusting to the interval between the eyes of the observer (fig. 1). After these discoveries the subject received no more attention until the 19th century; no improvements of these instruments are recorded in the literature of the second half of the 18th century.

The re-invention of the Dutch binocular telescope apparently dates from 1823, and is to be assigned to the Viennese optician, Johann Fried- rich Voigländner (1779–1859); but the credit of having placed these instruments on the market probably belongs to J. P. Lémieire in Paris, who, in 1825, took out a French patent for an improvement of the Dutch double telescope. Lémieire's instruments were furnished with a common focusing arrangement, and the adapting to the inter-pupillary distance was effected by turning the two parallel telescopes round their common axis.

The development of this instrument was studied by opticians for the remainder of the first half of the 19th century; the last improvement apparently was made by P. G. Bardou in 1854, and by H. Helmholtz in 1857 when he described the telestereoscope (fig. 2) with telescopic magnification. By utilizing the telescope with prism-inversion, devised in 1857 by Ignazio Porro (1795–1875), A. A. Boulanger succeeded in producing a binocular of an entirely new type in 1859 (fig. 3).

But he overlooked the possibility of increasing the distance between the objectives; Camille Nacher introduced this improvement in 1875, but his instruments did not meet with much popularity. This was probably due to the fact that, at this time, the manufacture of the glass for the prisms was too difficult; this was overcome by E. Abbe, after the founding of the glassworks at Jena, who effected, independently of his predecessors, the wider separation of the objectives (fig. 4), and increased it in the telestereoscope (fig. 5), or relief telescope, in a manner nearly approaching to Helmholtz's proposal.

The first binocular microscope was invented by the previously mentioned Father M. Rohr, who, in 1825, took a French patent for a double terrestrial telescope. The instrument consisted of two inverting systems, and consequently gave a totally wrong impression of depth, i.e. depressions appeared as elevations, and vice versa, or, as we must say after Charles Wheatstone, it presented a pseudoscopic impression; this quality, however, was not recognized by the microscopists of the time. The instrument subsequently fell into complete neglect for nearly two centuries, to be revived in 1852 by Charles Wheatstone, who has stated that he had previously studied the problem; the publication of his views in his second great paper "On Binocular Vision," in the Phil. Trans. for 1852, undoubtedly stimulated the investigation of this instrument, which was carried on with zeal and success more especially in England and the United States. In 1853 the American J. L. Riddell (1807–1867) devised his binocular microscope, which contained the essentials of Wheatstone's pseudoscope. F. H. Wenham, another constructor, did not at first succeed in avoiding the pseudoscopic effect, but, by the application of refracting dividing prisms, he subsequently arrived at orthoscopic representations and continued the development of the different methods for producing microphotographic stereograms; this was effected in the first case by placing a diaphragm over one half of the objective for each exposure, and in the second case by a suitable direction of the illuminating pencil (fig. 6). Of greater benefit, however, for stimulating interest in binocular microscopes, was his invention of reflecting dividing prisms (fig. 7). Other experiments, begun by Powell and Lealand, and developed with greater skill by Wenham, were concerned with the binocular vision of identical images. Such an impression could not possibly be stereoscopic, and these experiments led to the construction of a non-stereoscopic binocular microscope. Of the other workers in this field mention may be made

The first part appeared in 1838.
of Alfred Nachet, who in 1853, and subsequently in 1863, brought forward two forms of binocular microscope.

The earliest stages of the development of the binocular microscope had been always confined to those instruments with one objective, in the immediate neighbourhood of which the systems for dividing the pencil were placed. At a later date attempts were made to separate the two halves of the objective by modifying the eye-piece; this led to the construction of stereoscopic eye-pieces, initiated by R. B. Tolles, E. Abbe and A. Praemowski. Of special importance is the work of Abbe; although, as he himself has stated, his methods accidentally led to the Wenham system, he certainly was far above his predecessors in his theoretical treatment of the problem, and in the perspicuity and clearness of his explanation. To him is also due the re-establishment of the instruments, which Wenham had abandoned by reason of too great technical difficulties (fig. 8). The newest form of the binocular microscope is very similar to the oldest form in which two completely separated tubes were employed. The inventor, H. S. Greenough, employs two systems for setting up the image, in order to avoid the pseudoscopic effect. After experiments in the Zeiss works, the erecting of Porro's prisms simultaneously permitted a convenient adaptation to the eye-distance of the observer.

The first binocular magnifying glass or simple microscope (German, Lupe) was devised by J. L. Riddell in 1853; in this instrument (fig. 9) the pencil of light is transmitted to the eyes by means of two pairs of parallel mirrors. Of the many different improvements mention may be made of A. Nachet's. H. Westen made use of two Chevalier-Brücke's simple microscopes with their long working distances in order to form an instrument in which the curvature of the image was not entirely avoided. Mention may also be made of the binoculars of K. Fritsch (formerly Proeckh) and E. Berger.

**Binocular Instruments for Range-finding.**—For measuring purposes binocular telescopes with parallel axes are the only types employed. The measurement is effected by adjoining to the space or interval to be measured some means of measurement defined; for example, by a fixed scale which extends into the space, or by a movable point (Wandermaecke). This instrument shows a transition to the stereoscope, inasmuch as the scale or means of measurement is not directly observed, but to each eye a plane representation is offered, just as in the stereoscope; the space to be measured, on the other hand, is portrayed in exactly the same way as in the double telescope. The method for superposing the two spaces on one another was deduced by Sir David Brewster in 1856, but he does not appear to have dealt with the problem of range-finding. The problem was attacked in 1861 by A. Rollet; later, in 1866, E. Mach published a promising idea, and finally—independently of the researches of his predecessors—Hektor de Grousilliers, in partnership with the Zeiss firm (E. Abbe and C. Pulfrich), constructed the first stereoscopic range-finder suitable for practical use.

**BINOMIAL** (from the Lat. bi-, bis, twice, and nomen, a name or term), in mathematics, a word first introduced by Robert Recorde (1557) to denote a quantity composed of the sum or difference to two terms; as \(a+b\), \(a-b\). The terms trinomial, quadrinomial, multinomial, &c., are applied to expressions composed similarly of three, four or many quantities.

The binomial theorem is a celebrated theorem, originally due to Sir Isaac Newton, by which any power of a binomial can be expressed as a series. In its modern form the theorem, which is true for all values of \(n\), is written as

\[
(x+a)^n = \sum_{k=0}^{n} \binom{n}{k} x^{n-k} a^k
\]

where \(\binom{n}{k}\) is the binomial coefficient of \(n\) and \(k\), which is the number of ways to choose \(k\) elements from a set of \(n\) elements, and \(a\) is the binomial power or root required, \(p\) the first term of that quantity, and \(q\) the quotient of the rest divided by \(p\), the power, which may be a positive or negative integer or a fraction, and \(a, b, c, \&c.,\) the several terms in order, \(e.g., a = p^q, b = m\), \(c = \frac{m-n}{2n} bq, \&c.,\) so on.

In a second letter, dated the 24th of October 1676, to Oldenburg, Newton gave the train of reasoning by which he devised the theorem.

"In the beginning of my mathematical studies, when I was persuing the works of the celebrated Dr Wallis, and considering the series by the composition of which he exhibits the area of the circle and the hyperbola (for instance, in this series of curves whose common base is \(x\), and the ordinates respectively \((1-xx)^k\), \((1-xx)^r\), \((1-x)^k\), \((1-x)^r\), \&c.), I perceived that if the areas of the alternate curves, which are \(x, x^2, x^3, x^4, \ldots\), \(x^2, x^4, x^6, x^8, \ldots\), \&c., could be interpolated, we should obtain the areas of the intermediate ones, the first of which \((1-xx)^0\) is the area of the circle. Now in order to [do] this, it appeared that in all the series the first term was always what I shall call 2, 1, 2, 1; the second term \(x^2, x^4, x^6, x^8, \ldots\), &c., were in arithmetical progression; and consequently that the first two terms of all the series to be interpolated would be \(x, x^2, x^3, x^4, \ldots\), so that in the series for the second figure or term, the rest should be produced by the continued multiplication of the terms of this series \(x, x^2, x^3, x^4, \ldots\), \&c. This rule I therefore applied to the series to be interpolated.

And since, in the series for the circle, the second term was \(\frac{\pi}{8}\), I put \(m=\frac{\pi}{8}\) and hence I found the required area of the circular segment to be \(\frac{x^2}{2}, \frac{x^3}{3}, \frac{x^4}{4}, \ldots\), &c. And in the same manner might be produced the interpolated areas of other curves; as also the area of the hyperbola and the other alternates in this series \((1+xx)^0, (1+xx)^1, \ldots\), \&c. Having proceeded so far, I considered that the terms \((1-xx)^0, (1-xx)^1, \ldots\), \((1+xx)^0, \ldots\), \&c., that is, \(1, x^2, x^4, x^6, \ldots\), might be interpolated in the same manner as the areas generated by them, and for this, nothing more was required than to omit the denominators \(1, 3, 5, 7, \&c.,\) in the terms expressing the areas; that is, the coefficients of the terms of the quantity to be interpolated \((1-xx)^0, (1-xx)^1, \ldots\), \&c. (1-xx)^0 will
be produced by the continued multiplication of this series
\[
m \times \frac{m-1}{2} \times \frac{n-2}{3} \times \frac{m-3}{4} \ldots \text{&c.}
\]

The binomial theorem was thus discovered as a development of John Wallis's investigations in the method of interpolation. Newton gave no proof, and it was in the Ars Conjectandi (1713) that James Bernoulli's proof for positive integral values of the exponent was first published, although Bernoulli must have discovered it many years previously. A rigorous demonstration was not given for many years, Leonhard Euler's proof for negative and fractional values being faulty, and was finally given by Niels Henrik Abel.

The multi- (or poly-) nominal theorem has for its object the expansion of any power of a multinomial and was discovered in 1697 by Abraham Demoivre (see COMBINATORIAL ANALYSIS).

References.—For the history of the binomial theorem, see John Collins, Commercial Epistolicon (1712); S. P. Rigaud, The Correspondence of Scientific Men of the 17th Century (1841); M. Cantor, Geschichte der Mathematik (1894-1901).

**BINTURONG** (Arctis binturong), the single species of the viverrine genus *Arctis*, ranging from Nepal through the Malay Peninsula to Sumatra and Java. This animal, also called the bear-cat, is allied to the palm-civets, or paradoxures, but differs from the rest of the family (Viverridae) by its tufted ears and long, bushy, prehensile tail, which is thick at the root and almost equals in length the head and body together (from 28 to 33 inches). The fur is long and coarse, of a dull black hue with a grey wash on the head and fore-limbs. In habitats the binturong is nocturnal and arboreal, inhabiting forests, and living on small vertebrates, worms, insects and fruits. It is said to be naturally fierce, but when taken young is easily tamed and becomes gentle and playful.

**BINSON, LAURENCE** (1869- ), English poet, born at Lanesater on the 10th of August 1869, was educated at St Paul's school, London, and Trinity College, Oxford, where he won the Newdigate prize in 1890 for his *Persephone*. He entered the department of printed books at the British Museum in 1893, and was transferred to the department of prints and drawings in 1895, the Catalogue of English Drawings in the British Museum (1898, &c.) being by him. As a poet he is represented by Lyric Poems (1894), Poems (Oxford, 1895), London Visions (2 vols., 1895-1898), The Praise of Life (1896), Porphyriion and other Poems (1898), Odes (1900), The Death of Adam (1903), Penthesilea (1905), Dream come true (1905), Paris and Oeneone (1906), a one-act tragedy, and Attila, a poetical drama (1907); as an art critic by monographs on the 17th-century Dutch etchers, on John Crome and John Sell Cotman, contributed to the Portfolio, &c. In 1906 he published the first volume of a series of reproductions from William Blake, with a critical introduction.

See also R. A. Streatfeild, Two Poets of the New Century (1901), and W. Archer, Poets of the Younger Generation (1902).

**BIO-BIO**, a river of southern Chile, rising in the Pico Hachado pass across the Andes, 38° 45' S. lat., and flowing in a general north-westersly direction to the Pacific at Concepcion, where it is 2 m. wide and forms an excellent harbour. It has a total length of about 225 m., nearly one half of which is navigable.

**BIU BIBI**, an inland province of southern Chile, bounded N., W. and S. respectively by the provinces of Concepcion, Arauco and Malleco, and E. by Argentina. It has an area of 74,736 sq. m. of well-wooded and mountainous country, and exports timber to a large extent. The great trunk railway from Santiago S. to Puerto Montt crosses the western part of the province and also connects it with the port of Concepcion. The capital, Los Angeles (est. pop. 7777 in 1902) lies 5½ m. E. of this railway and is connected with it by a branch line.

**BIOGENESIS** (from the Gr. βιος, life, and γένεσις, generation, birth), a biological term for the theory according to which each living organism, however simple, arises by a process of budding, fission, spore-formation of sexual reproduction from a parent organism. Under the heading of **ABIOGENESIS** (q.v.) is discussed the series of steps by which the modern acceptance of biogenesis and rejection of abiogenesis has been brought about. No biological generalization rests on a wider series of observations, or has been subjected to a more critical scrutiny than that every living organism has come into existence from a living portion or portions of a pre-existing organism. In the articles REPRODUCTION and HEREDITY the details of the relations between parent and offspring are discussed. There remains for treatment here a curious collateral issue of the theory. It is within common observation that parent and offspring are alike: that the new organism resembles that from which it has come into existence: in fine, biogenesis is homogenesis. Every organism takes origin from a parent organism of the same kind. The conception of homogenesis, however, does not imply an absolute similarity between parent and organism. In the first place, the normal life-cycle of plants and animals exhibits what is known as alternation of generations, so that any individual in the chain may resemble its grand-parent and its grand-child, and differ markedly from its parent and child. Next, any organism may pass through a series of free-living larval stages, so that the new organism at first resembles its parent only very remotely, corresponding to an early stage in the life-history of that parent. (See EMBRYOLOGY, LARVAL FORMS AND REPRODUCTION.) Finally, the conception of homogenesis does not exclude the difference between biogenetic and embryonic forms that continually occur, forming the material for the slow alteration of stocks in the course of evolution (see VARIATION AND SELECTION). Homogenesis means simply that such organism comes into existence directly from a parent organism of the same race, and hence of the same species, sub-species, genus and so forth.

From time to time there have been observers who have maintained a belief in the opposite theory, to which the name heterogenesis has been given. According to the latter theory, the offspring of a given organism may be utterly different from itself, so that a known animal may give rise to another known animal of a different race, species, genus, or even family, or to a plant, or vice versa. The most extreme cases of this belief is the well-known fable of the "barnacle-geese," an illustrated account of which was printed in an early volume of the Royal Society of London. Buds of a particular tree growing near the sea were described as producing barnacles, and these, falling into the water, were supposed to develop into geese. The whole story was an imaginary embroidery of the facts that barnacles attach themselves to submerged timber and that a species of goose is known as the barnicle goose. In modern times the exponents of heterogenesis have limited themselves to cases of microscopic animals and plants, and in most cases, the observations that they have brought forward have been explained by minuter observation as cases of parasitism. No serious observer, acquainted with modern microscopic technical methods, has been able to confirm the explanation of their observations given by the few modern believers in heterogenesis. (P. C. M.)

**BIOGRAPHY** (from the Gr. βιος, life, and γραφι, writing), that form of history which is applied, not to races or masses of men, but to an individual. The earliest use of the word ἀντιγραφία is attributed to Damascus, a Greek writer of the beginning of the 6th century, and in Latin biographia was used, but in English no earlier employment of the word, "biography" has been traced than that of the 17th century. According to the work of Plutarch, the "history of particular men's lives." It is obvious that this definition is necessary, for biography is not the record of "life" in general, but of the life of a single person. The idea of the distinction between this and history is a modern thing; we speak of "antique biography," but it is doubtful whether any writer of antiquity, even Plutarch, clearly perceived its possible existence as an independent branch of literature. All of them, and Plutarch certainly, considered the writing of a man's life as an opportunity for celebrating, in his person, certain definite moral qualities. It was in these, and not in the individual characteristics of the man, that his interest as a subject of biography resided.

The true conception of biography, therefore, as the faithful portrait of a soul in its adventures through life, is very modern.
We may question whether it existed, save in rare and accidental instances, until the 17th century. The personage described was, in earlier times, treated either from the philosophical or from the historical point of view, which, for the most part, was that of the most elegant and stately beauty. Suetonius was the author of several biographical compilations, of which the Lives of the Twelve Caesars is the best-known; this was produced in the year 120. Marius Maximus, in the 4th century, continued the series of emperors down to Heliogabalus, but his work has not been preserved. The Augustan History, finished under Constantine, takes its place, and was concluded and edited by Flavius Vopiscus.

Biography hardly begins to exist in English literature until the close of the reign of Henry VIII. William Roper (1466–1527) wrote a touching life of his father-in-law, Sir Thomas More, and George Cavendish (1500–1567?), a memoir of Cardinal Wolsey which is a masterpiece of liveliness and grace. It is with these two works, both of which remained in manuscript until the 17th century, that biography in England begins. The lives of English writers compiled by John Bale (1495–1563) are much more primitive and slight. John Leland (d. 1552) and John Pits (1560–1616) were antiquaries who affected the species of biography. In the early part of the 17th century, the absence of the habit of memoir writing extremely impoverishes our knowledge of the illustrious authors of the age, of none of whom there are preserved such records as our curiosity would delight in. The absence of any such chronicle was felt, and two writers, Thomas Heywood and Sir Aston Cokayne, proposed to write lives of the poets of their time. Unfortunately they never carried their plans into execution. The pioneer of deliberate English biography was Isaac Walton, who, in 1640, published a Life of Donne, followed in 1651 by that of Sir Henry Wotton, in 1665 by that of Richard Hooker, in 1670 by that of George Herbert, and in 1678 by that of Dr Robert Saunders. These five reprinted, under the title of Walton's Lives, were not only charming in themselves, but the forerunners of a whole class of English literature. Meanwhile, Fuller was preparing his History of the Worthies of England, written between the years 1662, and John Aubrey (1667–1697) was compiling his Minutes of Lives, which show such a perfect comprehension of the personal element that should underlie biography; these have only in our own days been completely given to the public. Edward, Lord Herbert of Cherbury (1583–1648), wrote a brilliant autobiography, first printed in 1674; that of Anne Harrison, Lady Fanahawe (1625–1680), remained unknown until 1829. A very curious essay in biography is the memoir of Colonel John Hutchinson, written by his widow, Lucy, between 1664 and 1671. Margaret Lucas, duchess of Newcastle (1624–1674), wrote her own life (1656) and that of her duke (1667). The Athenas Oxonienses of Anthony à Wood (1632–1695) was a complicated celebration of the wit, wisdom and learning of Oxford notabilities since the Reformation. In 1668 Thomas Sprat (1635–1713) wrote a Life of Cowley, which was very much admired and which exercised for many years a beneficial influence on British biographers. Sprat was an earnest and fastidious admirer of the picturesque detail and the memoir should be omitted in the composition of a memoir, and that moral effect and a solemn vагности should be aimed at. The celebrated funeral orations of Jeremy Taylor were of the same order of eloquence, and the wind of those grandiose compositions destroyed the young shoot of genuine and simple biography which had budded in Walton and Aubrey.

From this time forth, for more than half a century, English biography became a highly artificial and rhetorical thing, lacking all the salient features of honest portraiture. William Oldys (1606–1761) was the first to speak out boldly; in 1747, in the preface to the Biographia Britannica, he pointed out “the cruelty, we might even say the impiety, of sacrificing the glory of great characters to trivial circumstances and mere convenience,” and attacked the timid and scrupulous superficiality of those who undertook to write lives of eminent men, while omitting everything which gave distinction to the portrait. In 1753 the Lives of the Poets, which bore the name of Theophrastus Cibber (1703–1758), but was mainly written by Robert Sheds...
In Italian literature, biography does not take a prominent place until the 15th century. The Lives of Illustrious Florentines, in which a valuable memoir of Dante occurred, was written in Latin by Filippo Villani. Vespasiano da Bisticci (1421-1498) compiled a set of biographies of his contemporaries, which are excellent of their kind. The so-called Life of Castiglione, by Machiavelli, is hardly a biography, but a brilliant essay on the ideals of statecraft. Paolo Giovio (1483-1552) wrote the lives of poets and soldiers whom he had known. All these attempts, however, seem insignificant by the side of the autobiography of Benvenuto Cellini (1501-1571), confessedly one of the most entertaining works of the world's literature. A great deal of biography is scattered throughout the historical compilations of the Italian renaissance, and the Lives of the Artists, by Giorgio Vasari (1512-1574), is a storehouse of anecdotes admirably told. We find nothing else that requires special mention till we reach the memoir-writers of the 18th century, with the autobiographies of Giambattista Vico and Alberoni; and on the whole, Italy, although adopting in the 19th century the habit of biography, has rarely excelled in it.

In Spanish literature Fernán Pérez de Guzmán (1378-1460), with great originality, enshrined, in his Generaciones y Like-nesses, a series of admirable literary portraits; he has been called the Plutarch of Spain. But, in spite of numerous lives of saints, poets and soldiers, Spanish literature has not excelled in biography, nor has it produced a single work of this class which is universally read. In Germany there is little to record before the close of the 18th century.

In the course of the 19th century a new thing in biography was invented, in the shape of dictionaries of national biography. Of these, the first which was carried to a successful conclusion was the Swedish (1833-1859), which occupied 23 volumes. This dictionary was followed by the Dutch (1852-1878), in 24 volumes; the Austrian (1856-1893), in 35 volumes; the Belgian (which was begun in 1866); the German (1875-1900), in 45 volumes; and others, representing nearly all the countries of Europe. England was behind the competitors named above, but when she joined the ranks a work was produced the value of which can hardly be exaggerated. The project was started in 1882 by the publisher George Smith (1824-1901), who consulted Mr (afterwards Sir) Leslie Stephen. The first volume of the Dictionary of National Biography was published on the 1st of January 1885, under Stephen's editorship. A volume was published quarterly, with complete punctuality until Midsummer 1900, when volume 63 closed the work, which was presently extended by the issue of three supplementary volumes. In May 1891 Leslie Stephen resigned the editorship and was succeeded by Mr Sidney Lee, who conducted the work to its prosperous close, bringing it up to the death of Queen Victoria. The Dictionary of National Biography contains the lives of more than 30,000 persons, and has proved of inestimable service in elucidating the private annals of the British people.

BIOLOGY (Gr. βιος, life). The biological sciences are those which deal with the phenomena manifested by living matter; and though it is customary and convenient to group apart such of these phenomena as are termed mental, and such of them as are exhibited by men in society, under the heads of psychology and sociology, yet it must be allowed that no natural boundary separates the subject matter of the latter sciences from that of biology. Psychology is inseparably linked with physiology; and the phases of social life exhibited by animals other than man, which sometimes curiously foreshadow human policy, fall strictly within the province of the biologist.

On the other hand, the biological sciences are sharply marked off from the abiological, or those which treat of the phenomena manifested by non-living matter; in so far as the properties of living matter distinguish it absolutely from all other kinds of things, and as the present state of knowledge furnishes us with no link between the living and the non-living.
The properties of living matter are intimately related to temperature. Not only does exposure to heat sufficient to coagulate protein matter destroy life, by demolishing the molecular structure upon which life depends; but vital activity, all phenomena of nutritive growth, movement and reproduction are possible only between certain limits of temperature. These limits may be set down as from a little above the freezing point of water to a little below the boiling point. It is to be noted, however, that these limits apply to the living matter itself, and many of the apparent exceptions are due to cases in which the living matter is enclosed in protective wrappings capable of resisting heat and cold. In many low organisms, such as the spores of bacteria, the thick, non-conducting wall may preserve the living protoplasm from subjection to external temperatures below freezing point, or above boiling point, but all the evidence goes to show that applications of such cold or heat, if prolonged or arranged so as to penetrate to the living matter, destroy life. In warm-blooded animals, such as birds and mammals, protective mechanisms for the regulation of temperature enable them to endure exposure to extreme heat or cold, but in such cases the actually living cells do not appreciably rise or fall in temperature. A variation of a very few degrees in the blood itself produces death.

Recent investigations point to the conclusion that the immediate cause of the arrest of vitality, in the first place, and of its destruction, in the second, is the coagulation of certain substances in the protoplasm, and that the latter contains various coagulable matters, which solidify at different temperatures. And it remains to be seen, how far the death of any form of living matter at a given temperature, depends on the destruction of its fundamental substance at that heat, and how far death is brought about by the coagulation of merely accessory compounds.

It may be safely said of all those living things which are large enough to enable us to trust the evidence of microscopes, that they are heterogeneous optically, and that their different parts, and especially the surface layer, as contrasted with the interior, differ physically and chemically; while, in most living things, mere heterogeneity is exchanged for a definite structure, whereby the body is distinguished into visibly different parts, which possess different powers or functions. Living things which present this visible structure are said to be organized; and so widely does organization obtain among living beings, that organized and living are not infrequently used as if they were terms of co-extensive applicability. This, however, is not exactly accurate, if it be thereby implied that all living things have a visible organization, as there are numerous forms of living matter of which it cannot properly be said that they possess either a definite structure or permanently specialized organs: though, doubtless, the simplest particle of living matter must possess a highly complex molecular structure, which is far beyond the reach of vision.

The broad distinctions which, as a matter of fact, exist between every known form of living substance and every other component of the material world, justify the separation of the biological sciences from all others. But it must not be supposed that the differences between living and not-living matter are such as to justify the assumption that the forces at work in the one are different from those which are to be met with in the other. Considered apart from the phenomena of consciousness, the phenomena of life are all dependent upon the working of the same physical and chemical forces as those which are active in the rest of the world. It may be convenient to use the terms "vitality" and "vital force" to denote the causes of certain great groups of natural operations, as we employ the names of "electricity" and "electrical force" to denote others; but it ceases to be proper to do so, if such a name implies the absurd assumption that "electricity" and "vitality" are entities playing the part of efficient causes of electrical or vital phenomena. A mass of living protoplasm is simply a molecular machine of great complexity, the total results of the working of which, or its vital phenomena, depend—on the one hand,
BION—

upon its construction, and, on the other, upon the energy supplied to it; and to speak of "vitality" as anything but the name of a series of operations is as if one should talk of the "horology" of a clock.

Living matter, or protoplasm and the products of its metamorphosis, may be regarded under four aspects:

1. Classification of the phenomena of life.
2. It occupies a certain position in space and in time;
3. It is the subject of the operation of certain forces in virtue of which it undergoes internal changes, modifies external objects, and is modified by them; and
4. Its form, place and powers are the effects of certain causes.

In correspondence with these four aspects of its subject, biology is logically divisible into four chief subdivisions—I. MORPHOLOGY; II. DISTRIBUTION; III. PHYSIOLOGY; IV. AETIOLOGY.

Various accidental circumstances, however, have brought it about that the actual distribution of scientific work does not correspond with the logical subdivisions of biology. The difference in technique, the lack of an unification of teaching, and the fact that in all civilized countries the progress of biological knowledge has been very closely associated with the existence of institutions for the diffusion of knowledge and for professional education, have been the chief contributory causes to this practical confusion. Details of the morphology of plants will be found in the articles relating to the chief groups of plants, those of animals in the corresponding articles on groups of animals, whilst the classification of animals adopted in this work will be found in the article ZOOLOGY. DISTRIBUTION is treated of under Zoological DISTRIBUTION, PLANKTON, PALEONTOLOGY and PLANTS: DISTRIBUTION. PHYSIOLOGY and its allied articles deal with the subject generally and in relation to man, while the special physiology of plants is dealt with in a section of the article PLANTS. AETIOLOGY is treated of under the heading EVOLUTION. But practical necessity has given rise to the existence of many other divisions; see CYTOLOGY, for the structure of cells; EMBRYOLOGY, for the development of individual organisms; HEREDITY and REPRODUCTION, for the relations between parents and offspring. (T. H. H.; P. C. M.)

BION—

Bion, the botanist, was born at Phlosa near Smyrna, and flourished about 100 B.C. The account formerly given of him, that he was the contemporary and imitator of Theocritus, the friend and tutor of Moschus, and lived about 280 B.C., is now generally regarded as incorrect. W. Stein (De Moschi et Bionis aetate, Tübingen, 1893) puts Bion, chiefly on metrical grounds, in the first half of the 1st century B.C. Nothing is known of him except that he lived in Sicily. The story that he died of poison, administered to him by some jealous rivals, who afterwards suffered the penalty of their crime, is probably only an invention of the author of the 'Encyklôps Bionos' (see MOSCHUS). Although his poems are included in the general class of bucolic poetry, the remains show little of the vigour and truthfulness to nature characteristic of Theocritus. They breathe an exaggerated sentimentality, and show traces of the overstrained reflection frequently observable in later developments of pastoral poetry. The longest and best of them is the Lament for Adonis ("Enôrphos ᾿Aδόνου"). It refers to the first day of the festival of Adonis (February 15), on which the death of the favourite of Aphrodite was lamented, thus forming an introduction to the Adonisæac of Theocritus, which is the second day, when the reunion of Adonis and Aphrodite was celebrated. Fragments of his other pieces are preserved in Stobaeus; the epitalamium of Achilles and Deidameia is not his.

Bion and Moschus have been edited separately by G. Hermann (1849) and C. Ziegler (Tübingen, 1869), the Epitaphios Adonis by H. L. Ahrens (1854) and E. Hiler in Beiträge zur Textgeschichte der griechischen Bukoliker (1888). Bion's poems are generally included in the editions of Theocritus. There are English translations by J. Banks (1853) in Bohn's Classical Library, and by Andrew Lang (1886), with Theocritus and Moschus; there is an edition of the text by U. Wilamowitz-Möllendorff in the Oxford Scriptorum Classicum Bibliotheca (1905). On the date of Bion see F. Büchter in Rheinisches Museum, xxx. (1875), pp. 33-41; also G. Knaack in Pauly-Wissowa's Realencyclopaedie, s.v.; and F. Susemihl, Geschichte der griechischen Literatur in der Alexandrinzeit, i. (1891), p. 233.

BION, of Borysthenes (Olbia), in Sarmatia, Greek rhetorician and philosopher, flourished in the first half of the 3rd century B.C. He was of low origin, his mother being a courtesan and his father a dealer in salt fish, with which he combined the occupation of smuggling. Bion, when a young man, was sold as a slave to a rhetorician, who gave him his freedom and made him his heir. After the death of his patron, Bion went to Athens to study philosophy. Here he attached himself in succession to the Academy, the Cynics, the Cyrenaics and the Peripatetics. One of his teachers was the Cyrenaic Theodorus, called "the atheist," whose influence is clearly shown in Bion's attitude towards the gods. After the manner of the sophists of the period, Bion travelled through Greece and Macedonia, and was admitted to the literary circle at the court of Antigonus Gonatas. He subsequently taught philosophy at Rhodes and died at Chalics in Euobea. His life was written by Diogenes Laertius. Bion was essentially a popular writer, and in his Distributiae he satirized the follies of mankind in a manner calculated to appeal to the sympathies of a low-class audience. While eulogizing poverty and philosophy, he attacked the gods, musicians, geometers, astrologers, and the wealthy, and denied the efficacy of prayer. His work was widely diffused in succeeding writers, e.g. in the satires of Menippus. Horace (Epistles, ii. 2. 60) alludes to his sibyls and casuist (sal nigram). An idea of his writings can be gathered from the fragments of Teles, a cynic philosopher who lived towards the end of the 3rd century, and who made great use of them. Specimens of his apophthegms may be found in Diogenes Laertius and the florilegium of Stobaeus, while there are traces of his influence in Seneca.

See Hoogvliet, De Vita, Doctrina, et Scriptis Bionis (1821); Rosignoli, Fragmenta Bionis Borysthenita (1830); Heinze, De Hortio Bionis Imitatore (1886).

BIOT, JEAN BAPTISTE (1774—1862), French physicist, was born at Paris on the 21st of April 1774. After serving for a short time in the artillery, he was appointed in 1797 professor of mathematics at Beauvais, and in 1800 he became professor of physics at the Collège de France, through the influence of Laplace, from whom he had sought and obtained the favour of reading the proof sheets of the Mécanique céleste. Three years later, at an unusually early age, he was elected a member of the Academy of Sciences, and in 1804 he accompanied Gay Lussac on the first balloon ascent undertaken for scientific purposes. In 1806 he was associated with F. J. D. Arago, with whom he had already carried out investigations on the refractive properties of different gases, in the measurement of an arc of the meridian in Spain, and in subsequent years he was engaged in various other geodetic determinations. In 1814 he was made chevalier and in 1824 commander, of the Legion of Honour. He failed in his ambition of becoming perpetual secretary of the Academy of Sciences, but was somewhat consoled by his election as a member of the French Academy in 1856. He died in Paris on the 3rd of February 1862. His researches extended to almost every branch of physical science, but his most important work was of an optical character. He was especially interested in questions relating to the polarization of light, and his observations in this field, which gained him the Rumford medal of the Royal Society in 1840, laid the foundations of the polarimetric analysis of sugar.

Biot was an extremely prolific writer, and besides a great number of scientific memoirs, biographies, &c., his published works include: Analyse de la mécanique céleste de M. Laplace (1801); Traité analytique des courbes et des surfaces du second degré (1802); Recherches sur l'intégration des équations différentielles partielles et sur les vibrations des surfaces (1803); Traité de physique (1816); Recueil d'observations géodésiques, astronomiques et physiques effectuées en Espagne et Écosse, with Arago (1821); Mémoire sur la vraie constitution de l'atmosphère terrestre (1841); Traité élémentaire d'astronomie physique (1850); Recherches sur
BIOTITE—BIRBHUM

957

The colour is usually dark-green or brown; thick crystals are often deep-black and opaque. The absorption of light-rays vibrating parallel to the cleavage is much greater than of rays vibrating in a direction perpendicular thereto, and in dark-coloured crystals the former are almost completely absorbed. The angle between the optic axes is usually very small, the crystals being often practically uniaxial; an axial angle of 90° has, however, been recorded in a dark-coloured biotite. The specific gravity of biotite is, as a rule, higher than that of other micas, varying from 2.7 to 3.1 according to the amount of iron present. The hardness is 2½ to 3½.

Several varieties of biotite are distinguished. By G. Tschermak it is divided into two classes, merozo and anomie; in the former the plane of the optic axis coincides with the plane of symmetry, whilst in the latter it is perpendicular thereto. Meroxene includes nearly all ordinary biotite, and is the name given by A. Breithaupt in 1841 to the Vesuvian crystals; on the other hand, anomie (named from ἀνωμία, "contrary to law") is of rare occurrence. Haughtonite and siderophyllite are black varieties rich in ferrous iron, and lepidomelane (from λεπίς, a scale, and μέλας, black) is a variety rich in ferric iron. Baryotobiotite and mananganophyllite the magnesia is partly replaced by baryta and manganese oxide respectively. Rubellane, hydrobiotite, pseudobiotite, and others are altered forms of biotite, which is a mineral particularly liable to decomposition with the production of chlorites and vermiculites.

Biotite is a common constituent of igneous and crystalline rocks: in granite, gneiss and mica-schist it is often associated with muscovite (white mica), the two kinds having sometimes grown in parallel position. In volcanic rocks, and in nearly all other kinds of igneous rocks with the exception of granite, biotite occurs to the exclusion of the muscovite. In the dyke-rocks known as mica-traps or mica-lamprophyres biotite is especially abundant. It is also one of the most characteristic products of contact-metamorphism, being developed in sedimentary and other rocks at their contact with granite masses. In the ejected blocks of crystalline limestone of Monte Somma, Vesuvius, the most perfectly developed crystals of biotite (figs. 1, 2), or indeed of any of the micas, are found in abundance, associated with brilliant crystals of augite, olivine, humite, &c.

Although biotite (black mica) is much more common and widely distributed than white mica, yet it is of far less economic importance. The small size of the sheets, their dark colour and want of transparency render the material of little value. Large, cleavable masses yielding fine smoky-black and green sheets, sufficiently elastic for industrial purposes, are, however, found in Renfrew county, Ontario.

(L. J. S.)

BIPARITE (from the Lat. bi-, two, and partire, to divide).

In a general sense, the word means having two corresponding parts or in duplicate. In geometry, a biparite curve consists of two parts (see Parabola, figs. 3, 5). In botany, the word is applied to leaves divided into two parts near the base. A biparient factor is a number whose square exactly divides another number. In zoology, the Bipariti was a name given by P. A. Latreille to a group of carnivorous Coleoptera.

BIPONT EDITIONS, the name of a famous series of editions, in 50 volumes, of Greek and Latin classical authors, so called from Bipontium, the modern Latin name of Zweibrücken or Deux-Ponts in Bavaria, where they were first issued in 1770. Their place of publication was afterwards transferred to Strasburg.

BIPOLAR, of, or relating to, a bi-polar. In mathematics, the bipolarmetric power or root of a quantity is its fourth power or root (see Algebra); a bipolarmetric equation is a equation in which the highest power of the unknown is the fourth (see Equation: Biquadratic).

BIQUINTILE (from Lat. prefix bi-, twice, quintilis, fifth), the aspect of two planets which are distant from each other twice the fifth part of a great circle, i.e. 144°. It was one of the new aspects introduced by Kepler.

BIRBHUM, a district of British India in the Birudan division of Bengal, situated in the Ganges plain and partly on the hills, being bounded on the south by the river Ajai. The administrative headquarters are at Suri, which is the only town in the district. The area comprises 1752 sq. m. The eastern portion of the district is the ordinary alluvial plain of the Gangetic delta; the western part consists of undulating beds of laterite resting on a rock basis, and covered with small scrub jungle. The Ajai, Bakheswar and Mur or Muraikshi, are the principal rivers of the district, but they are merely hill streams and only navigable in the rains. In 1901 the population was 902,800, showing an increase of 13% in the decade. The principal industry is the spinning and weaving of silk, chiefly from tussur or jungle silk-yielding plants. There are in the district several jute factories. The loop-line of the East Indian railway runs through the district, with a junction at Nalhati for Murshidabad.

History.—Birbhum in the early part of the 13th century was a Hindu state, with its capital at Rajnagar or Nagar. In the course of the century it was conquered by the Pathans and formed part of the Pathan kingdom of Bengal. At the beginning of the 18th century it appears as a kind of military fief held under the nawab of Murshidabad by one Asadullah Pathan, whose family had probably been its chieftains since the fall of the Pathan dynasty of Bengal in 1600. It passed into British possession in 1765, but the East India Company did not assume its direct government until 1787, when that course became necessary. In the interval it had been a prey to armed bands from the highlands of Chota Nagpur, with whom the raja was unable to cope, and who practically brought the trade of the Company in the district to a standstill. The two border principalities of Birbhum and Bankura were accordingly united into a district under a British collector, being, however, separated again in 1793. By 1789, after...
considerable trouble, the marauders were driven back into their mountains, and since then time (except during the Santal rising of 1855) the district has been one of the most peaceful and prosperous in India.

See Imperial Gazetteer of India (Oxford, 1908), vol. viii. s.w.

**BIRCH, SAMUEL** (1813–1885). English Egyptologist and antiquary, was born on the 3rd of November 1813, being the son of the rector of St Mary Woolnoth, London. From an early age he manifested a tendency to the study of out-of-the-way subjects, and after a brief employment in the Record Office obtained in 1836 an appointment in the antiquities department of the British Museum on account of his knowledge of Chinese. He soon extended his researches to Egyptian, and when the cumbrous department came to be divided he was appointed to the charge of the Egyptian and Assyrian branch. In the latter language he had assistance, but for many years there was only one other person in the institution—in a different department—who knew anything of ancient Egyptian, and the entire arrangement of the department devolved upon him. Birch found time nevertheless for Egyptological work of the highest value, including the highest in the grammar and dictionary, translations of The Books of the Dead and the Harris papyri, and numerous catalogues and guides. He further wrote what was long a standard history of pottery, investigated the Cypriote syllabary, and proved by various publications that he had not lost his old interest in Chinese. Paradoxally in many of his views on things in general, he was sound and cautious as a philologist: while learned and laborious, he possessed much of the instinctive divination of genius. He died on the 27th of December 1885.

**BIRCH, THOMAS** (1705–1766). English historian, son of Joseph Birch, a coffee-mill maker, was born at Clerkenwell on the 23rd of November 1705. He preferred study to business, but as his parents were Quakers he did not go to the university. Notwithstanding this circumstance, he was ordained deacon in the Church of England in 1730 and priest in 1731. As a strong supporter of the Whigs, he gained the favour of Philip Yorke, afterwards lord chancellor and first earl of Hardwicke, and his subsequent preferments were largely due to this friendship. He held successively a number of benefices in different counties, and finally in London. In 1735 he became a member of the Society of Antiquaries, and was elected a fellow of the Royal Society, of which he was secretary from 1752 to 1765. In 1728 he had married Hannah Cox, who died in the following year. Birch was killed on the 9th of January 1766 by a fall from his horse, and was buried in the church of St Margaret Pattens, London, of which he was then rector. He left his books and manuscripts to the British Museum, and a sum of about £500 to increase the salaries of the three assistant librarians.

Birch had an enormous capacity for work and was engaged in a large number of literary undertakings. In spite of their dulness many of his works are of considerable value, although Horace Walpole questioned his "parts, taste and judgment." He carried on an extensive correspondence with some of the leading men of his time, and many of his letters appear in Literary Anecdotes of the 18th Century (London, 1812–1813) and Illustrations of the Literary History of the 18th Century (London, 1817–1858) by J. Nichols, in the Bibliotheca Topographica Brittanica, vol. iii. (London, 1780–1790), and in Boswell's Life of Johnson. Birch wrote most of the English lives in the General Dictionary, Historical and Critical, 10 vols. (London, 1742–1741), assisted in the composition of the Athenian Letters (London, 1810), edited the State Papers of John Thurlow (London, 1742) and the State Papers of W. Murdin (London, 1759). He also wrote a Life of the Right Honourable Robert Boyle (London, 1744); Inquiry into the share which King Charles I. had in the transactions of the Earl of Glamorgan for bringing over a body of Irish rebels (London, 1750); Historical view of Negotiations between the Courts of England, France and Brussels 1592–1617 (London, 1740); Life of Archbishop Tillotson (London, 1753); Memoirs of the Reign of Queen Elizabeth from 1581 (London, 1754); History of the Royal Society of London (London, 1756–1757): Life of Henry, Prince of Wales (London, 1760), and many other works. Among the papers left at his death were some which were published in 1848 as the Court and Times of James I. and the Court and Times of Charles I.

**BIRCH** (*Betula*), a genus of plants allied to the alder (*Alnus*), and like it a member of the natural order Betulaceae. The various species of birch are mostly trees of medium size, but several of them are merely shrubs. They are as a rule of a very hardy character, thriving best in northern latitudes—the trees having round, slender branches, and serrate, deciduous leaves, with barren and fertile catkins on the same tree, and winged fruits, the so-called seeds. The bark in most of the trees occurs in fine soft membranous layers, the outer cuticle of which peels off in thin, white, papery sheets.

The common white or silver birch (*B. alba*) (see fig.) grows throughout the greater part of Europe, and also in Asia Minor, Siberia and North America, reaching in the north to the extreme limits of forest vegetation, and stretching southward on the European continent as a forest tree to 45° N. lat., beyond which birches occur only in special situations or as isolated trees. It is well known in England for its graceful habit, the slender, grey—or white—barked stem, the delicate, drooping branches and the quivering leaves, a bright, clear green in spring, becoming duller in the summer, but often keeping their greenness rather late into the autumn. The male and female flowers are borne on separate catkins in April and May. It is a short-lived tree, generally from 40 to 50 ft. high with a trunk seldom more than 1 ft. in diameter. It flourishes in light soils and is one of the few trees that will grow amongst heather; owing to the large number of "winged seeds" which are readily scattered by the wind, it spreads rapidly, springing up where the soil is dry and covering clearings or waste places.

The birch is one of the most wide-spread and generally useful of forest trees of Russia, occurring in that empire in vast forests, in many instances alone, and in other cases mingled with pines, poplars and other forest trees. The wood is highly valued by carriage-builders, upholsterers and turners, on account of its toughness and tenacity, and in Russia it is prized as firewood and a source of charcoal. A very extensive domestic industry in Russia consists in the manufacture of wooden spoons, which are made to the extent of 30,000,000 annually, mostly of birch. Its pliant and flexible branches are made into brooms; and in ancient Rome the fasces of the liclers, with which they cleared the way for the magistrates, were made up of birch rods. A similar use of birch rods has continued among pedagogues times so recent that the birch is yet, literally or metaphorically, the instrument of school-room discipline. The bark of the common birch is much more durable, and industrially of greater

*Betula alba*. 1. Branch with male (*a*) and female (*b*) inflorescences; 2. branch with three male flowers; 3. branch with three female flowers; 4. infrutescence; 5. fruit. (After Wossidlo.)
value, than the wood. It is impermeable to water, and is therefore used in northern countries for roofing, for domestic utensils, for boxes and jars to contain both solid and liquid substances, and for a kind of bark shoes, of which it is estimated 25 millions of pairs are annually worn by the Russian peasantry. The jars and boxes of bark made by Russian peasants are often stamped with very effective patterns. By dry distillation the bark yields an empyreumatic oil, called diogott in Russia, used in the preparation of Russian leather; to this oil the peculiar pleasant odour of the leather is due. The bark itself is used in tanning; and by the Samoiedes and Kamchatkans it is ground up and eaten on account of the starchy matter it contains. A sugary sap is drawn from the trunk in the spring before the opening of the leaf-buds, and is fermented into a kind of beer and vinegar. The whole tree, but especially the bark and leaves, has a very pleasant resinous odour, and from the young leaves and buds an essential oil is distilled with water. The leaves are used as fodder in northern latitudes.

The species which belong peculiarly to America (B. lenta, excelsa, nigra, papysacea, &c.) are generally similar in appearance and properties to B. alba, and have the same range of applications. The largest and most valuable is the black birch (B. lenta) found abundantly in the eastern states of the British North America. It grows to 60 to 70 ft. high, and 2 to 3 ft. in diameter. It is a wood most extensively used for furniture and for carriage-building, being tough in texture and bearing shocks well, while much of it has a handsome grain and it is susceptible of a fine polish. The bark, which is dark brown or reddish, and very durable, is used by Indians and backwoodsmen in the same way as the bark of B. alba is used in northern Europe.

The canoe or paper birch (B. papysacea) is found as far north as 70° N. on the American continent, but it becomes rare and stunted in the Arctic circle. Professor Charles Sprague Sargent says: "It is one of the most widely distributed trees of North America. From Labrador it ranges to the southern shores of Hudson’s Bay and to those of the Great Bear Lake, and to the valley of the Yukon and the coast of Alaska, forming with the aspen, the larch, the balsam poplar, the birch-slime pine, the black and white spruces and the balsam fir, the great subarctic transcontinental forest; and southward it ranges through all the forest region of the Dominion of Canada and the United States. It is a tree of common growth in the deciduous forests of the Mackenzie district to British North America. Its bark is used for the construction of canoes, and for drinking-cups, dishes and baskets. From the wood, platters, axe-handles, snow-shoe frames, and dog sledges are made, and it is worked into articles of furniture which are susceptible of a good polish. The sap which flows in the spring is drawn off and boiled down to an agreeable spirit, or fermented with a birch-wine of considerable alcoholic strength. The bark is also used as a substitute for paper. A species (B. Bhapisuta) growing on the Himalayan Mountains, as high up as 0000 ft., yields large quantities of fine thin papery bark, extensively sent down to the plains as a substitute for wrapping paper, for covering the “snakes” of hookahs and for umbrellas. It is also said to be used as writing paper by the mountaineers; and in Kashmir it is in general use for roofing houses.

**BIRCH-PFEIFFER—BIRD**

Erzählungen, were collected in three volumes (Leip. 1863–1867).

Her daughter, Wilhelmine von Ihlen (b. 1836), born at Munich, went on the stage, but retired upon her marriage in 1857. After 1889 she lived in Oberammergau and won a reputation as a novelist. Her most popular works are Ein Art der Seele (1869, 4th ed. 1886); and Die Geier-Wally (1883), which was dramatized and translated into English as The Vulture Maiden (Leip. 1876).

**BIRD,** the common English name for feathered vertebrates, members of the class Aves. The word in Old Eng. is *brid* and in Mid. Eng. *byrd* or *bred,* and in early uses meant the young or nestlings only. It is partly due to this early meaning that the derivation from the root of “ *brood* ” has been usually accepted; this the *New English Dictionary* regards as “ inadmissible.”

The word does not occur in any other Teutonic language. As a generic name for the feathered vertebrates “ *bird* ” has replaced the older “ *fowl,* ” a common Teutonic word, appearing in German as Vogel. “Bird,” when it passed from its earliest meaning of “nestlings,” seems to have been applied to the smaller, and *fowl* to the larger species, a distinction which was maintained by Johnson. In modern usage “ *fowl* ” except in “wild-form” and “ *wild-fowl* ” is restricted to domestic birds.

The scope of the anatomical part of the following article is a general account of the structure of birds (Aves) in so far as they, as a class, differ from other vertebrates, notably reptiles and mammals, whilst features especially characteristic, peculiar or unique, have been dwelt upon at greater length so far as space permitted. References to original papers indicate further sources of information. For a comprehensive account the reader may be referred to Prof. M. Förbringer’s enormous work *Untersuchungen zur Morphologie und Systematik der Vögel,* 4 vols. (1888); H. G. Bronn’s *Klassen und Ordnungen des Thierreichs,* vol. vi., “Aves,” Leipzig, completed 1803 by Gadow; and A. Newton’s *Dictionary of Birds,* London, 1896.

For the history of the classification of birds see the article **ORNITHOLOGY,** where also the more important ornithological works are mentioned. Egg, Feather (including Moth), Migration, &c., also form separate articles to which reference should be made. In this article (A) the general anatomy of birds is discussed, (b) fossil birds, (c) the geographical distribution of birds, (d) the latest classification of birds.

**A. ANATOMY OF BIRDS**

1. Skeleton.

**Skull.—**When W. K. Parker wrote the article of the skull in the article **BIRDS** for the 6th edition of the Encyclopaedia Britannica, he had still to wrestle with the general problem of the composition and evolution of the skull. That chapter of comparative anatomy (together with other anatomical details, for which see the separate articles) is now dealt with in the article **Skull;** here only the most divine features are alluded to, since some of Parker’s original illustrations have been retained, the description has been shortened considerably.

One general feature of the adult bird’s skull is the almost complete disappearance of the sutures between the bones of the cranial proper, whilst another is the great movability of the whole palatal and other suspensorial apparatus. The occipital condyle (fig. 1) is a single knob, being formed almost wholly by the basi-occipital, while the lateral occipitals (often perversely called exoccipitals) take but little share in it. Part of the membranous roof between the supra-occipital and parietal bones frequently remains unossified and presents in the macerated skull a pair of fontanelles. The squamosals form the posterior outer margin of the orbit and are frequently continued into two lateral downward processes across the temporal fossa. One of these, the *processus orbitalis posterior,* often combines with an outgrowth of the alisphenoid, and may be, e.g., in cockatoos, continued forward to the supra-occipital bone, so as to form a complete intraorbital bridge. The posterior, so-called *processus Zygomaticus* is very variable: in many Galli it encloses a foramen by distally joining the orbital process. The ethmoid frequently appears on the dorsal surface between the frontals. There are three periosteal bones (pro-, ep-, opisth-otic). The prootic encloses between it and the lateral occipital the fenestra ovalis, into which fits the columella of the ear. The epiotic is often small, ossifies irregularly.
and fuses with the supra-occipital. The opisthotic lies between the epiotic and the lateral occipital with which it ultimately fuses; in some birds, e.g., in *Larus*, it extends far enough to help to bound the foramen magnum. The basisphenoids are ventrally overlaid, and later on fused with a pair of membrane bones, the basi-temporals, homologous in part with the parasphenoid of lower vertebrates. They contribute to the formation of the auditory meatus, and of the right and left carotid canals which accompany the eustachian tubes.

In many birds the basi-sphenoid sends out a pair of basi-pterigoid processes by which they articulate with the pterygoids. Dorso-laterally the basisphenoid is joined by the alisphenoid, which forms much of the posterior wall of the orbit. The orbito-sphenoids diverge only posteriorly, otherwise they are practically unarticulated and form the median interorbit septum, which is very large in correlation with the extraocular size of the eyeballs.

**Fig. 4.**—Right Pterygoid, showing the pterygo-palatal processes. (A. H. Garrod.)

Post-secretory bones are absent; post-frontals are possibly indicated by a frequently occurring separate centre of ossification in the post-orbital process, to which the frontals always contribute. The lacrymal is always present, and perforated by a glandular duct. Attached to it or the neighbouring frontals is often a supraboral; infraorbitals occur also, attached to the jugal or downward process of the lacrymal. The nasals were used by A. H. Garrod to distinguish the birds of amorphous (fig. 2) where the anterior margin of the nasal is concave, and schizorhinal where this posterior border of the outer nares is continued backwards into a slit which extends beyond the frontal processes of the premaxilla. Many birds possess a more or less well developed cross-joint in front of the frontals and lacrymales, perhaps best developed in *Anseres* and *Ptilacii*.

Owing to this joint the whole upper beak can be moved up and down with extra facility, according to the shoving forwards or backwards of the palato-pterigoid-quadrate apparatus which moves sledge-like upon the cranial basis. The premaxilla is always unpaired, but each half has three long processes directed backwards; one fuses with the maxillary bone, another helps to form the anterior part of the palate, while the third, together with its fellow, forms the “culmen” and extends backwards to the frontals, or rather to the ethmoid which there crops up on the surface. The maxillaries (fig. 3) have besides others, a maxillo-palatine process directed inwards in a transverse horizontal direction. The palatines are long, always fused anteriorly with the premaxilla, and frequently with the maxillo-palatine processes; posteriorly they slide upon the premaxillar rostrum, and articulate in most birds with the pterygoids: they form the greater part of the palatal roof and border the choanae or inner nares. Between these, resting vertically upon the rostrum, appears the vomer, very variable in size and shape, often reduced to a mere trace, as in the Galli, or even absent, broken up into a pair of tiny splints in Pici.

The taxonomic importance of the configurations of the palate was first pointed out by J. de Corny. T. H. Huxley, in 1868, divided the carinate birds into Dromaeo-, Schizo-, Dendro-, and Aegithognathae, an arrangement which for many years had a considerable influence upon classification. However, subsequent additions and corrections have detracted much from its value, especially when it became understood that the above sub-orders are by no means natural groups. *Dromaeognathae* have a struthious palate, with a broad vomer meeting in front the broad maxillo-palatal plates, while behind it reaches the pterygoids. The only representatives are the Tinamous. *Schizognaudae*, e.g., fowls (fig. 4), pigeons, gallinaceous birds, rails and penguins, have the vomer pointed in front while the maxillo-palatinous are free, leaving a fissure between the vomer and themselves. The schizognathous formation is doubtless the most primitive, and its representatives form a tolerably natural
assembly. Desmognathae (fig. 5) were supposed to have the maxillo-palatines united across the middle line, either directly or by the inter-

FIG. 4.—Skull of adult Fowl. This skull is unusually schizognathous, the vomer (v) being very small, and the maxillo-palatine process (mxp) much aborted.

posterior mandibular process. The greater part of the under-jaw is formed by the right and left dentaries, which in all recent birds are fused together in front. Supra-angular and coronoid splint-bones serve for the insertion of part of the temporal or masseter muscle. Additional splints rest on the inner side of the jaw. Like the crocodiles, birds possess a sphenion, i.e. a membranous, or ossified, tube which rises from a pneumatic foramen in the os articular, on the median side of the articulation, and passes upwards between the quadrate and lateral occipital bone, opening into the cavity of the middle ear.

The Hyoid apparatus is, in its detail, subject to many variations in accord with the very diverse uses to which the tongue of birds is
in birds we distinguish between the following regions of the axial skeleton. (1) Cervical vertebrae, or those between the skull and the first vertebral which is connected with the sternum by a pair of complete ribs. The last 1 to 5 of these vertebrae have mobile ribs which do not reach the sternum, and are called cervico-dorsals. (2) Dorsals, those which begin with the first thoracic rib, and end at the last that is not fused with the ilium. The term "lumbar" vertebrae is inapplicable to birds. (3) Pelvic, all those which are fused with the pelvis, generally a considerable number. (4) Caudal, those which are not connected with the pelvis. It is to be noted that often no absolute line of demarcation can be drawn in regard to these regions, their definitions being rather convenient than logical.

In comparison with all other vertebrates the number of neck-vertebrae varies considerably; the lowest number, 14 to 15, is that of most Passeres and many other Coraciformes; the highest numbers, 23 or 24, are found in the ostrich, 24 in Cygnus olor and 25 in the black swan. Dorsal vertebrae frequently have a ventral outgrowth of the centrum; these hypophyses may be simple vertical blades, or paired knobs; they serve for the attachment of the thoracic origin of the long collantium muscle, reaching their greatest development in Sophienidae and Columbidae. In many birds some of the thoracic vertebrae are more or less ossified, in most pigeons for instance the 15th to 17th; in most Galli the last cervical and the three or four thoracics are ossified.

The pelvic vertebrae include of course the sacrum. There are only two or three vertebrae which are homologous with those of the reptiles; these true sacras are situated in a level just behind the acetabulum; as a rule between these two primary sacral vertebrae issues the last of the spinal nerves which contributes to the composition of the sciatic plexus. These true sacras alone are connected with the ilium which are really equivalent to the modified ribs; but the pelvis of birds d.d.Lumbo-lumbar, s. sacral, extends considerably farther backwards c. caudal vertebrae and backwards, gradually diminishing into other vertebrae, which in various ways send out connecting transverse processes or buttresses, and thus become pre- and post-sacral vertebrae (fig. 9). The most anterior part of the ilium often overlaps one or more short lumbar and extends considerably farther backwards.

Similarly during the growth of the bird the posterior end of the ilium connects itself with the transverse processes of vertebrae which were originally free, thus transforming them from caudoals into secondary post-sacral vertebrae. Individual and local variations are frequent.

The last six or seven caudal vertebrae coalesce into the pygostyle, an upright blade which carries the rectrices. Such a pygostyle is absent in Archaeopteryx, Hesperornis, Tinam and Ratilae, but it occurs individually in old specimens of the ostrich, and is called Ichthyornis. In all the Neornithes the total number of caudal vertebrae, inclusive of those which coalesce, is reduced to at least 13.

Sternum (figs. 10 and 11).—Characteristic features of the sternum are the following. There is a well-marked processus lateralis anterior (the right and left, together equivalent to the mammalian manubrium), which is the product of two or three ribs, the dorsal parts of which reduced ribs remain as cervico-dorsals. It then follows the rib-bearing portion and then the processus lateralis posterior; this also is the product of ribs, consequently the right and left processes are equivalent to the xiphoid process or xiphisternum of the mammals. The lateral process in most birds sends out an outgrowth, directed out and upwards, overlapping some of the ribs, the processus obliquus. The median and posterior extension of the body of the sternum is a direct outgrowth of the latter, therefore...
called meta-sternum. The anterior margin of the sternum, between the right and left anterior lateral processes receives in sockets the feet of the coracoids. Between them arises a median crest, which varies much in extent and composition, and is of considerable taxonomic value. It is represented either by a spine interna or by a spine externa, or by both, or they join to form a spine which is often very large and sometimes ends in a bifurcation. Eventually, when the wing is folded the long clavus surface of the humerus is bordered above by the tuberculum externum or superius, in the middle, and below by the tuberculum medium or inferius for the insertion of the coraco-brachialis posterior muscle. From the outer tuberculum (or ectepicondylar, or radial) a larger knob for the ulna and a smaller oval knob for the radius. Above this knob is often present an ectepicondylar process which arise the tendons of the ulnar and radial flexors. The radius is the straighter and more slender of the two forearm bones. Its proximal end forms a shallow cup for articulation with the outer condyle of the humerus; the distal end bears a knob which fits into the radial carpal. The ulna is curved and rather stout; it articulates with both the radial bones: the cubital ulna often cause rugosities on its dorsal surface. Of wrist-bones only two remain in the adult bird; the original distal carpals coalesce with the proximal end of the metacarpals. These are reduced, in all birds, to three, but traces of the fourth have been observed in embryos. The first metacarpal is short and fuses throughout its length with the second. This and the third are much longer and fuse together at their upper and distal ends, leaving as a rule a space between the shafts. The pollex and the third finger are as a rule reduced to one phalanx each, while the index still has two. The first and second fingers frequently carry a little claw. The greatest reduction of the hand-skeleton is met with in Dromaeus and in Apteryx, which retain only the index finger. It is of importance for our understanding of the position of the Ratitae in the system, that the wing-skeleton of the ostrich and rheas is an exact repetition of that of typical flying birds; the bones are much more slender, and the muscles are considerably reduced in strength also to a lesser extent in numbers, but the total length of the wing of an ostrich or a rhea is actually and comparatively enormous. Starting with the kiwi and cassowary, people have got into the habit of confounding flightless with wingless conditions. It is absolutely certain that the wings of the Ratitae bear the strongest testimony that they are the descendants of typical flying birds.
The pelvis (fig. 13), consisting of the sacrum (already described) and the pelvic arch, namely ilium, ischium and pubis, it follows that only birds and mammals possess a pelvis proper, whilst such is entirely absent in the Amphibia and in reptiles with the exception of some of the Dinosaurs. The ventral inner margin of the preacetabular portion of the ilium is attached to the pre-sacral vertebral, whilst the inner and dorsal margin of the postacetabular portion is attached to the primary sacral and the postacral vertebral. In rare cases the right and left preacetabular blades fuse with each other above the hinder processes. In front of the acetabulum a thick process of the ilium descends to meet the pubis, and a similar process behind meets the ischium. The acetabulum is completely surrounded by these three bones, but its cup always retains an open passage from its posterior rim up the strong antrochondral. The ischium and postacetabular ilium originally enclose the ischiadic notch or incisura ischiadica. This primitive condition occurs only in the Odontornithes (q.v.), Ratitae and Tinamii; in all others this notch is much reduced or even entirely absent. The ischiadic notch or incisura ischiadica completely encloses the base of the acetabulum, thus passing the posterior processus acetabuli and the main blood-vessels of the hind-limb. The pubis consists of a short anterior portion (spina pubica or pectineal process, homologous with the proacetabular process of Dinosaurs) and the long and slender pubis proper (equivalent to the processus lateralis pubis of most reptiles). The shaft of the pubis runs parallel with that of the ischium, with which it is connected by a short ligamentous or bony bridge; this cuts off from the long incisura pubica-tibiadica a proximal portion, the foramen obturatorium, for the passage of the obturator nerve. Only in the ostriarch the distal ends of the pubes meet, forming a dagger-shaped symphysis, which is curved forwards. The pectineal process is variable; it may grow entirely from the pubis, or both pubis and ilium partake of its formation, or lastly its pubic portion may be lost and the process is entirely formed by the ilium. It is largest in the Gall and some of the Cuculii, in others it is hardly indicated. It served originally for the origin of the adductor muscle (see Muscular System below); shifting or disappearance of this muscle, of course, influences the process.

The Hind Limb. The femur often possesses a well-visible pneumatic foramen, on the median side of the proximal end of its shaft. The inner condyle, the intercondylar sulcus, and a portion only of its outer condyle articulate with corresponding facets of the tibia. The outer condyle articulates mainly with the fibula. There is a patella, intercalated in the region of the femur-tibiales or extensor cruris muscle. In Colombus the patella is reduced to a small osicle, its function being taken by the greatly developed pyramidal processus tibialis anterior; in Podicipes and Hesperornis the patella itself is large and pyramidal. The distal half of the fibula is very slender and normally does not reach the ankle-joint; it is attached to the peroneal ridge of the tibia. On the anterior side of the tibia, is the intercondylar sulcus, which is crossed by an oblique bridge of tendon or bone forming the tendon of the adductor digiti communis muscle. The condyles of the tibia are in reality not parts of this bone, but are the three proximal tarsalia which fuse together with the distal end of the tibia. The distal tarsalia likewise fuse together, the upper ends of the three tarsalia centrale remain, sometimes as a separate osseous nodule, buried in the inter-articular pad. Consequently the ankle-joint of birds is absolutely crucio-tarsal and tarso-metatarsal, i.e. intertarsal, an arrangement absolutely diagnostic of birds if it did not also occur in some of the Dinosaurs. Of the metatarsals the third occurs as an embryonic vestige near the joint; the first is reduced to its distal portion, and is, with the hallux, shoved on to the inner and posterior side of the foot, at least in the majority of birds. The three middle metatarsals become fused together into a cannon bone; the upper part of the third middle metatarsals projects behind and forms the so-called hypotharsus, which in various ways, characteristic of the different groups of birds (with one or more sulci, grooved or perforated), acts as guiding pulley to the tendons of the flexor muscles of the toes. Normally the four toes have two, three, four and five phalanges respectively, but in Cygnus the number is reduced to three in the front toes. Reduction of the number of toes (the fifth shows no traces whatever, not even in Archaeopteryx) begins with the hallux, which is completely or partly absent in many birds; the second toe is absent in Pterodactylus. These toes are quite plantigrade, in adaptation to which habit the metatarsals lie in one plane and are incompletely co-ossified, thus presenting a pseudo-primitive condition.

LITERATURE.—Only a mere fragment of the enormous literature dealing with the skeleton of birds can here be mentioned.

Of the muscles of the stem or axis, those of the neck and tail are well-developed and specialized, while those of the lower back are more or less reduced, or even completely degenerated owing to the rigidity of this region, brought about by the great antero-posterior extent of the pelvis. The muscles of the limbs show a great amount of specialization, away from the fundamental reptilian and mammalian conditions. The muscles of the fore limbs are most aberrant, but at the same time most uniformly developed than those of the hinder extremities. The muscles of the hind-limb show all the usual modification, deep affecting the skeletal, muscular and tendinous structures, but floating, skimming, sailing, soaring are motions much more akin to one another than climbing and grasping, running, scratching, paddling and wading. The modifications of the hind-limbs are in fact many times greater (such as extremely long legs, with four, three or only two toes; very short legs, almost incapable of walking, with all four toes directed forwards, or two or one backwards, and two or more connected and therefore bound to act together, in various
The wing of the bird is folded in a unique way, namely, the radius parallel with the humerus, and the whole wrist and hand with their ulnar side against the ulna; upper and forearm in a state of suspension, the hand in that of strong abstraction. Dorsal and ventral bending, even in the extended wing, is almost impossible. Consequently only a few of the original extensor muscles have been preserved, but these are much modified into very independent organs, notably the extensor metacarpi radialis longus, the ext. metac. ulnaris and the two radio- and ulnari-metacarpi muscles, all of which are inserted upon the metacarpus by means of long tendons. The chief muscular mass, arising from the sternum in the shape of a U, is the pectoralis muscle; its fibres converge into a strong tendon, which is inserted upon the greater tubercle and upper crest of the humerus, which it depresses and slightly rotates forwards during the downstroke. This great muscle covers completely the supracoracoideus generically described as the second pectoral, or subclusus muscle, in reality homologous with the mammalian extensor coracohumeralis. This arises mostly from the angle formed by the keel with the body of the sternum, passes by a strong tendon through the foramen tri- oseum, and is inserted upon the upper tubercle of the humeral crest, which it rotates and abducts. The extent of the origin of this muscle from the sternum, on which it leaves converging, parallel or diverging impressions, is of some taxonomic value.

Much labour has been bestowed by A. H. Garrod and Max Führinger upon the various modifications of the inserting tendons of the patagial muscles (fig. 14), mainly from a taxonomic point of view. The propatagialis longus muscle is composed of slips from the deltoid, pectoral, biceps and cucculaturs muscles. Its strong belly originates near the shoulder joint from clavicle, coracoid and scapula. Its elastic tendon runs directly to the coracoid, forming thereby the outer margin of the antecoracoid process, and is lost in skin between the antecoracoid and forearm. It serves to extend, together with the propatagialis brevis muscle. This runs down the anterior and outer side of the upper arm, and is attached to the proximal tendon of the extensor metacarpi radialis longus, a little below the outer condyle of the humerus. In most birds the tendon is split into several portions, one of which is often attached to the outer side of the ulna, below the elbow joint, while others are in variable and characteristic ways connected with similar slips of the propatagialis longus. The posterior patagium, the fold between trunk and inner surface of the upper arm, is stretched by the meta-

failure. Its author, with a considerable mathematical and mechanical bias, reckoned entirely with the quantity, not with the quality of his units, and relied almost implicitly upon his formulae. It is, however, fair to state that his system was not built entirely upon these muscular variations, but rather upon a more laborious combination of anatomical characters, which were so selected that they presumably could not stand in direct correlation with each other, notably the oil-gland, caeca, carotids, nasal bones and above all, the muscles of the thigh. He was, indeed, the first to show clearly the relationship of the heron-like birds with the Steganopodes; of stock-like birds with the American vultures; the great difference between the latter and the other birds of prey; the connexion of the gulls and auks with the plovers, and that of the sand-grouse with the

pigeons—discoveries expressed in the new terms of the orders Ciconiformes and Charadriiformes. These are instances, now well understood, that almost every organic system, even when studied by itself, may yield valuable indications as to the natural affinities of the various groups of birds. That Garrod has so very much advanced the classification of birds is ultimately due to his comprehensive anatomical knowledge and general insight. To return to these thigh muscles. The most primitive combination, ambiens and A B X Y, is the most common; next follows that of A X Y, meaning the reduction of B, i.e., the iliac portion of the caudal-ilio-femoralis; A B X and B X Y are less common, A X Y and X Y are rare and occur only in smaller groups, as in sub-families or genera; B X Y occurs only in Podicipes. But the greatest reduction, with only A remaining, is characteristic of such a heterogenous assembly as Accipitres, Cypselidae, and Tyrannoidea. The fact is sufficient proof that these conditions, or rather reductions, have been acquired independently of the various groups. A B Y, A Y, A B X Y and B do not occur at all, some of them for obvious reasons. Occasionally there is an instructive progressive evolution expressed, for instance, in Phaethon, in various other respects the lowest of the Steganopodes, has A X Y, Sula and Phalaroceros have A X Fregata, the most specialized of these birds, has arrived at the reduced formula A. Further, the combinations B X Y and A X Y cannot be derived from each other, but both directly from A B X Y in two different directions. Keeping this in mind, we may fairly conclude that the flamingo with B X Y points to an ancestral condition A B X Y, which is still represented by Phalacrocorax and Ixobrychus, whilst the other combinations have proper taken a different line, leading to A X Y.

Brain.—The more characteristic features of the bird's brain show clearly a further development of the reptilian type, not always terminal features in a direct line, but rather side-departures, sometimes even a secondary sinking to a lower level, and in almost every case in a direction away from those fundamentally reptilian lines which have led to the characters typical of and peculiar to the mammals.

The forebrain forms the bulk of the whole brain, but the large size of the hemispheres is due to the greater development of the basal and lateral portions (pedunculi cerebris and corpora striata), while the pallium (the portion external to the lateral ventricles) is thin, and remains more or less similar to the mesencephalon of most reptiles. This is, though largely secondary reduction of the pallium—due to the excessive preponderance of the basal and lateral parts—the corpus callosum (i.e., the transverse commissure of the right and left pallium) is still retained, but reduced to a bundle of a few fibres; it is situated immediately above and behind the much stronger anterior commissure, i.e., the connexion between the corpora striata, or chief remaining part of the hemispheres. Owing to the small size of the cerebral hemispheres, the olfactory lobes are placed high in the skull. There is very little grey matter in the cortex of the hemispheres, the surface of which is devoid of convolutions, mostly quite smooth; in others, for instance pigeons, fos and birds of prey, a very slight folding might be considered with advantage.

The Thalamencephalon is much reduced. The epiphysis, or pineal body, is quite as degenerate as in mammals, although still forming a long stalk as in reptiles. In birds, this stalk consists entirely of the finger-joints, which in the adult enclose no terminal vessel, and fuse to form the corpus callosum. These are the olfactory lines of the skull. The midbrain is represented chiefly by the optic lobes, the cortex of which alone is homologous with the corpora quadrigemina of the mammals. Their transverse dorsal connexion is the posterior commissure; otherwise the whole roof of the midbrain is reduced to a thin membrane, continuous with that which covers the Sylvian aqueduct, and this inclosure sends a lateral cavity into each optic lobe, as is the case in reptiles. The right and left lobes themselves are rent asunder (so to speak), so that each forms but a single lobe, represented by the optic lobes, the Remarks formed by the hemispheres and the cerebellum. The latter is, in comparison with mammals, represented by its middle portion only, the vermian; in a sagittal section it shows an extremely well marked fourth convolution, and the olfactory lines of the skull are completely surrounded by the cerebellum. In comparison with reptiles the cerebellum of birds bears a high development. Forwards it covers, and has driven asunder, the optic lobes; backwards it hides the much shortened medulla oblongata.

Several futile attempts have been made to draw conclusions as to the intelligence of various birds, from comparison of the weight of the whole brain with that of the body, or the weight of the hemispheres with that of other parts of the central nervous system.

In the muscles are the nerve roots of the spinal nerves; the last nerve of thisplexus often marks the boundary of the cranial and thoracic vertebrae. The composition of the plexus varies much, not only in different species, but even individually. The great number of these nerves depends chiefly upon the length of the neck, the extremities being represented by the Cephalus (10th-14th cervical) and Cygnus (22nd-24th), the usual numbers of the common fowl being the 20th-24th cervical.
ANATOMY

The Sympathetic System forms a chain on either side of the vertebral column. In the region of the neck lateral strands pass through the transverse canal of the cervical vertebrae; but from the thoracic region on wards, where the cardiac branch to the heart is given off, each of the chains is divided into two, the one being connected with the next by a branch which runs ventrally over the capitulum of the rib, and by another which passes directly through the foramen or space formed between capitulum and tuberculum. In the pelvic region, from about the level of the posterior end of the ilium, the chains are connected with the base of each of the sacral segments, ventrally over the transverse processes. Lastly, towards the caudal region the right and left strands approach and Anastomose, eventually coalescing in the mid line.

The eye is essentially reptilian, but in sharpness of vision, power and quickness of accommodation it surpasses that of the mammals. The eyeball, instead of being globular, resembles rather the tube of a short and thick opera-glass.

The anterior half of the sclerotic is composed of a ring of some ten to seventeen cartilaginous or bony scales which partly overlap each other. In some birds, or other groups, the possible fusion of these scales, which occurs within the walls of the posterior portion of the cup, and surrounds, especially in the Pici and in the Passeres, is the entrance of the optic nerve. The iris is in most young birds at first brown or dull-coloured, but with maturity attains very bright tints which add considerably to the charm of the bird; sexual dimorphism is in this respect of common occurrence. The iris contains a sphincter and a dilator muscle; the former, supplied by branches from the oculomotorius nerve, is under control of the will, whilst the dilator fibres belong to the sympathetic system. When the fully dilated, the system of the pupil is round in all birds; when contracted it is usually round, rarely oval as in the fowl. From near the entrance of the optic nerve, through the original choroidal fissure, arises the much folded pigmentary epithelium, and you can then see the dark and white of the humour. The number of its folds varies considerably, from three in Caprimulgus to nearly thirty in crow (Corvus). Aperyx, which with Owen has generally been stated to be devoid of such an organ, likewise possesses a pigmentary epithelium; its opacity is due to the state of development of its' eye. The pupil is almost like that of the mammal, the iris is consequently freer that of the mammal, the iris is consequently freer.

Nose.—The olfactory organ is poorly developed, and it is still a question whether birds possess much power of smell; many are certainly devoid of it.

The olfactory perceptive membrane is restricted to the posterior innermost region of the nasal chamber, where it covers a slight bulging-out prominence. This so-called third, upper, or posterior conch is not a true conch, nor is that of the vestibulum; only the middle one forms a scroll, and this corresponds to the only one of reptiles and the lower of the mammals. The nasal cavity communicates with the mouth by the chonas or posterior nares, situated between the palatine process of the maxillare and especially in Sula, where the nasal slits become completely closed up, and the greater portion of the nasal cavity is also abolished, being restricted to the olfactory region with its unusually wide channels. Mammals furnish us with some interesting examples of this apparatus. In the Aplodytes, the nasal passage is almost imperceptibly narrowed; in the ciconiiformes, a peculiar state of affairs is maintained, the nostril being at first a mere slit and subsequently a small opening and the embryonic cavity of the head occupying the place of the nasal cavity. Venous System.—The bird’s liver receives nearly all the blood from the stomach, gut, pancreas and spleen, as well as from the left liver itself, into the right hepatic lobe, by a right and left portal vein. The venae cavae posterior and inferior (the latter) break up into the two femoral veins, which pass in the femoral triangle, and unite in the inguinal region, where they are joined by the left renal vein, which flows into the abdominal cavity, the right renal vein being absent. The left renal vein, longer than the right, joins the inferior caval vein at the level of the 11th thoracic vertebra, and is a tributary of the inferior caval vein. It is joined by the left suprarenal vein, which passes from the left suprarenal gland and is a tributary of the inferior caval vein. The inferior caval vein passes through the diaphragm, and enters the right atrium. It is joined by the right renal vein, which passes from the right suprarenal gland and is a tributary of the inferior caval vein. The inferior caval vein passes through the diaphragm, and enters the right atrium.

The heart lies in the middle line of the body, its long axis being parallel with that of the trunk. The whole ventral surface of the pericardium is exposed when the sternum is removed. The right ventricle is cut into four chambers by septa, and the left ventricle into two.

The atria are comparatively small, and the walls thin, especially those of the left ventricle. The right ventricle has two chambers, the right atrium, and the right ventricle.

The great vena cava enters the right atrium by the right atrial orifice. The pulmonary veins enter the left atrium by the coronary orifice. The aorta arises from the left ventricle by the aortic orifice.

The pulmonary veins are divided into two systems, one entering the left atrium, the other entering the right atrium. The right atrium is divided into two chambers, the right atrium and the right ventricle. The left atrium is divided into two chambers, the left atrium and the left ventricle.

The aorta is the chief artery of the body, and is divided into two parts, the ascending and descending aorta. The ascending aorta is a short, thick-walled canal, which arises from the left ventricle, and passes upward through the thoracic cavity. The descending aorta is a long, thin-walled canal, which passes downward through the abdominal cavity. It is divided into two branches, the left subclavian artery and the left common carotid artery.

The thoracic duct is a large, thin-walled canal, which passes from the thoracic cavity to the abdominal cavity. It is divided into two parts, the thoracic duct and the abdominal duct. The thoracic duct is a large, thin-walled canal, which passes from the thoracic cavity to the abdominal cavity. It is divided into two parts, the thoracic duct and the abdominal duct.
exist, with great variations, between the specialized one or two last tracheal and some of the first bronchial rings.

According to the position of the chief sound-producing membranes, three types of syrinx are distinguishable:—(1) Tracheo-bronchial, by far the commonest form of which the two others are of a more external modification. The essential feature is that the proximal end of the inner membranes is attached to the last pair of tracheal rings; outer tympaniform membranes exist generally between the 2nd, 3rd, and 4th bronchial semi-rings. This type attains its highest development in the Anurognathidae and Megalopodidae. (2) Syrinx bronchialis. The outer membranes are spread out between two or more successive bronchial semi-rings, a distance from the trachea which, in typical cases, devoid of sounding membranes; some are very short, others of moderate length. Thus, for Syrinx, the lower portion of the trachea consists of thin membranes, about half a dozen of the rings being very thin or deficient. Inner and outer membranes may exist on the bronchi. The Traecheophora among the Passerines is the most modified. That type of syrinx, form a tolerably well-marked group, entirely neotropical. But indications of such a syrinx occur also in Pittidae, pigeons and gallinaceous birds (Gallidae), the last cases being clearly analogous. While the type of syrinx affords no help in classification, it is very different with its muscles. These—indicated by their supply from a branch of the hypoglossal nerve, which descends on either side of the trachea—are of two kinds, the first mostly independent of the tracheo- and pharyngeal muscles. Omitting the paired tracheo-clavicular muscles, we restrict ourselves to the syringly proper, those which extend between tracheal and bronchial rings. Their numbers vary from one pair in the reptiles, to a pair at either end of the bronchial semi-rings (Mesomysodi), or upon the ends of these semi-rings where these pass into the inner tympaniform membrane (Acromysodi). The former is morphologically the more primitive condition, and is found in the overwhelming majority of the birds. The latter is the result of the acromyodian condition, and is only found in the bird mammals. The acromyodian type is restricted almost entirely to the Ostrich. Further, according to these muscles being inserted only upon the dorsal, or only upon the ventral, or on both ends of the semi-rings, we distinguish the following types:—(1) Passeres aniomyodi, in which the syrinx muscles are inserted on or near the ventral side of the tubes. This type comprises the Clamatoridae. (2) Passeres diomyodi, in which some of the syrinx muscles are attached to the dorsal, and some to the ventral ends, those ends being, so to say, equally treated. This type comprises the Gruiformes, including the Clamatoridae. (3) Passeres myodi, in which all of the syrinx muscles are attached to the dorsal end of the tubes. This type is subdivided into two categories:—(a) Passeres acromyodi, in which the muscles are attached to the dorsal end only, and (b) Passeres mesomysodi, in which all of the muscles are attached to the ventral end only. This type is the basis of the Ostrich. This division is based upon the knowledge of anatomical facts and how to use them. There remains but one logical way, namely, to distinguish as follows:—(1) Passeres aniomyodi, in which the syrinx muscles are inserted, either on the ventral side, or on the ventro-dorsal side of the tubes. (2) Passeres diomyodi, in which one or more of the syrinx muscles are inserted on the dorsal side of the tubes. This type comprises the Clamatoridae. (3) Passeres myodi, in which one or more of the syrinx muscles are inserted on the ventral side of the tubes. This type comprises the Gruiformes, including the Clamatoridae. (4) Passeres niomyodi, in which all of the syrinx muscles are inserted either on the dorsal or the ventral side of the tubes. This type is subdivided into two categories:—(a) Passeres acromyodi, in which all of the muscles are inserted on the ventral side of the tubes, and (b) Passeres mesomysodi, in which all of the muscles are inserted on the dorsal side of the tubes. This type comprises the Ostrich. (5) Passeres myodi, in which all of the muscles are inserted on the ventral side of the tubes. This type is subdivided into two categories:—(a) Passeres acromyodi, in which all of the muscles are inserted on the ventral side of the tubes, and (b) Passeres mesomysodi, in which all of the muscles are inserted on the dorsal side of the tubes. This type comprises the Ostrich. This division is based upon the knowledge of anatomical facts and how to use them. There remains but one logical way, namely, to distinguish as follows:—(1) Passeres aniomyodi, in which the syrinx muscles are inserted, either on the ventral side, or on the ventro-dorsal side of the tubes. (2) Passeres diomyodi, in which one or more of the syrinx muscles are inserted on the dorsal side of the tubes. This type comprises the Clamatoridae. (3) Passeres myodi, in which one or more of the syrinx muscles are inserted on the ventral side of the tubes. This type comprises the Gruiformes, including the Clamatoridae. (4) Passeres niomyodi, in which all of the syrinx muscles are inserted either on the dorsal or the ventral side of the tubes. This type is subdivided into two categories:—(a) Passeres acromyodi, in which all of the muscles are inserted on the ventral side of the tubes, and (b) Passeres mesomysodi, in which all of the muscles are inserted on the dorsal side of the tubes. This type comprises the Ostrich.

8. Cloaca and Genital Organs.

The cloaca is divided by transverse circular folds, which project from its inner walls, into three successive chambers. The innermost, the coprodaeum, is an oval dilatation of the end of the rectum, and attains its greatest size in those birds whose faces are very large. The internal rectum is coiled around to form a pouch, the coprodaeum, and acts as a dilator of the rectum and the rectal wall. The next chamber, the urodaeum, is small, and receives in its dorso-lateral wall the ureters and the genital ducts; above and below this chamber is closed by circular folds, the lower of which projects into the cloacal cavity, and is the copulatory organ when such is present. The urodaeum serves only as a passage, the urine being mixed with the faces in the cloacal chamber. The third or outermost chamber, the proctodaeum, is closed externally by the sphincter and the orifice is quite circular. It is through the copulatory organ, and on its dorsal wall lies the biscutum, an organ peculiar to birds. It is most developed in the young of both sexes, is of unknown function, and becomes more or less obliterated in the adult. Only in the estrus it remains through the length of the abdomen. It is surrounded by a muscular ring, and is a single lumen, with an absolutely unique arrangement. A true urinary bladder, i.e., a ventral dilatation of the urodaeum, is absent in all birds. It is significant that the whole type of their cloaca much resembles that of the Crocodilia and Chelonia, to which is much similar to that of the Lacertilia.

The penis, and its much reduced vestige of the female, is developed from the ventral wall of the proctodaeum. It occurs in two different forms. In the Rattiae, except Rhea, it consists mainly of a right side, with a minute part of the left side. When the right side is used, it protrudes from the cloacal cavity, with a short, longitudinal furrow along its dorsal side, and much resembles the same organ in crocodiles and tortoises. It is protruded and retracted by special muscles which are partly attached to the ventral, distal end of the illum. When the left side is used, it is retracted, and the right is used, it protrudes. Special muscles are attached to its dorsal side, stabilized by being spirally twisted and partly reversible like the finger of a glove. This is mainly due to the greater development of an unpaired, median portion, analogous to the mammalian corpus spermogonium, which is much less prominent in the Rattiae; the muscles of this type are derived solely from the anl sphincter. In other Carnitacae, e.g., tinamous and storks, the penis is very much smaller and simpler, with every appearance of a degenerated organ. In the great majority of birds it has disappeared completely and the prima way of entering the cloaca is resorted to.

Both right and left testes are functional. They become greatly

7. Digestive System.

For a general account of the digestive organs, see ALIMENTARY CANAL. Here only a few peculiar features may be mentioned.

The hoatzin, Phosphuscouus, feeds to a great extent upon the leaves of the azalea Montrichardia or Caladium arborescentes. The crop is modified into a large and very rugose triturating apparatus, while the gizzard, thereby relieved of its function, is reduced to the utmost. The large and heavy crop has caused a unique modification of the duodenal arrangement. The duodenum is divided into two portions, the upper being pushed back to the distal third of the sternum, whilst the original anterior margin of the keel is correspondingly elongated, and the furcula fused with the rostral portion.

In the ostrich, Struthio, the craze of overloading the stomach with macerated seed, which, when divided, has brought about a dislocation, so that the enormously widened and stretched space between proventriculus and gizzard forms a bag, directed downwards, whilst the gizzard itself with part of the duodenum is raised up at an angle of 18°. This dislocation occurs in various petrels, in correlation with the indigestible sepia-bills, &c., which these birds swallow in great quantities. In Plataus, the snakibird, the pyloric chamber of the stomach is divided into two passageways, one of which is filled with thin fluid and the other is filled with thick fluid, running to the duodenum. The gizzard of various birds which are addicted to eating hairy caterpillars, e.g., Cuculus canorus and trogons, is often lined with the broken-off hairs of these caterpillars, which, penetrating the cuticle, assume a regular spiral arrangement, due to the rotary motion of the muscles of the gizzard.

ANATOMY]
enlarged in the breeding season; in the sparrow, for instance, from the size of a mustard seed to that of a small cherry. The vas deferens descends with many undulations down the lateral side of the ureter of the same side, and opens upon a small papilla into the urachus. Extraordinary increases in length during the breeding season have been noticed in some of the African weaver-birds to protrude, or to bulge out the cloacal walls beyond the vent. The spermatozoa exhibit many differences in shape, size and proportions, in the various groups of birds. They have been studied mainly by E. C. Ballowitz.

Only the left ovary becomes functional, with rare individual exceptions. Both present the appearance of diminutive clusters of grapes, at the anterior end of the kidneys, close to the suprarenal body. The ovary is formed from each other by the descending aorta and by the vena cava where this is formed by the right and left cava inferior communis. During the breeding season many eggs are developed than reach maturity, amounting in most birds to several dozen at a time. All these are discharged during the season undergo a process of resorption, and in the winter the whole ovary dwindles to often a diminutive size. In young birds both oviducts are almost equal in size, but the right soon degenerates into an insignificant strand. During every laying season the left duct increases enormously by new formation of its component fibres. For instance, in the fowl its volume increases about fifty-fold, growing from some 6 in. in length and scarcely one line in width to more than 2 ft. in length and ¾ in. in thickness. The upper, wide opening of the duct is attached by elastic, plexiform lamellae to the hinder margin of the left lung; the middle portion of the duct is glandular and thick-walled, for the deposition of the albumen; it is connected by a short, constricted "stoma" (where the shell-membrane is formed), with a dilated diverticulum in which the eggs receive their calcareous shell and eventual pigmentation.

B. FOSSIL BIRDS

Much had naturally been expected from the study of fossil birds, but, so far as the making of classifications is concerned, they have proved rather a source of perplexities. So long as the characters of new fossils are only of specific and generic value, it is mostly possible to assign the birds to their proper place, but when these characters indicate new families or orders, for instance Hesperornithes, Ichthyornithes, Palaeolodii, their owners are put outside the more tersely constructed classifications applicable to modern birds. It is no exaggeration to say that the genus, often even the species, can be determined from almost any recent bone, but in the case of Miocene, and still more, of Eocene fossils, we have often to deal with strange families, which either represent an extinct side branch, or which connect several recent groups with each other. Our artificially-classified classifications collapse whilst we gain further insight into the mutual affinities of the existing groups. Of course this must be so if evolution is true: it follows that, if evolution is true, no families, no genera, no species, no orders could be defined. We should be able to construct the pedigree of every group, in other words, the gigantic natural system, but there would be no classification. Much light has also been thrown by fossil birds upon the study of recent geographical distribution. The key to the distribution of recent groups lies in that of the extinct forms. Not only have many absolutely new families been discovered, but many kinds of modern birds are now known to have existed also in countries which they are now extinct. There were, for instance, trogons, secretary-birds, parrots, and other now Ethiopian forms in Miocene France. Ostriches, undistinguishable from Struthio, have been found in Samos and in the Sivalik Hills.

The proper study of fossil birds may be said to have begun with A. Milne-Edwards, whose magnificent Oiseaux fossiles de la France was published from 1867 to 1871. This work deals chiefly with mid-Tertiary forms. A new impetus was given by O. C. Marsh, who, after 1870, discovered a great number of bird remains in the Cretaceous strata of North America. The most important result is the proof that, until the end of the Cretaceous epoch, most, if not all, birds were still possessed of teeth (see Ondontornithes).

The oldest known bird is the Archaeopteryx (q.v.), of the upper Oolite in Bavaria. The imprints in the enormously older new red sandstone or Lower Trias of Connecticut, and originally named Ornithinichthyes, belong to Dinosaurian Reptiles. A wide gap separates Archaeopteryx from the next order of fossil birds of the Cretaceous epoch, and, since freshwater deposits of that age are rare, bird remains are uncommon. Many bones formerly referred to birds have since proved to belong to Pterodactyla, e.g. Cimolius from the English Chalk. But in 1858 were discovered in the Upper Greensand of British Columbia remains which are now known as Enaliorhynus. W. Dames has described bones from the English Chalk of southern Sweden under the name of Scianorhynus, probably allied to Palaeolodus. From the Cretaceous rocks of North America a large number of birds have been described by O. C. Marsh. Of these the most interesting are Ichthyornhis (= Graculavis) and Hesperornis, from the Cretaceous shales of Kansas. They were placed by Marsh in a distinct subclass of birds, Odontornithes (q.v.). Probably all birds of Cretaceous age were still possessed of teeth. Baptorhynus, another of Marsh's genera, seems to be related to Enaliorhynus, Palaeostrichina and Talmatornus, were by him referred to Lincolia and Passerine birds. Lornis from the Cretaceous marls of New Jersey was as large as a swan.

The lower Eocene has furnished a greater number of bird bones. Some of the largest are those of Gastornis, with three species from France, Belgium and England. Much difference of opinion obtains as to the affinities of these birds, which were far larger than an ostrich; they were undoubtedly incapable of flight and there are indications of teeth in the upper jaw. Provisionally this genus has been grouped with the Ratitae, which at any rate are a heterogeneous assembly. Sir R. Owen's Desornis, of the London Clay, known from an imperfect cranium, and E. D. Cope's Diastrix of New Mexico, based upon a gigantic

FIG. 17. — Remains of head of Odontopteryx, from the original in the British Museum; side view; natural size.

metatarsus, may also belong there. The London Clay of South England has likewise supplied some long upper arm bones, Argillornis. The most remarkable specimen is a skull, Odontopteryx tolaiopicus (figs. 17, 18); the edges of the jaws were serrated

FIG. 18. — Remains of head of Odontopteryx, seen from above like those of certain tortoises. The character of this skull and the compound rhamphotheca (known by the imprints left upon the jaws) indicate affinities with the Steganopodes. Remnants
of a heron-like bird, *Proherodius*, of a gull-like creature, *Halocyornis*, a captive *Eudromia*; and a supposed *Passerine* from Glarus in Switzerland, called *Protornis* = *Osteornis*, complete the list.

The upper Eocene has yielded many birds, most of which are at least close forerunners of recent genera, the differentiation into the leading orders and families being already well marked, e.g. Gallinaceae birds, stork- and crane-like waders, rails, birds of prey, cormorants, &c. Especially numerous bones have been found in the Paris basin, chiefly described by G. Cuvier, F. L. P. Gervais, E. Blanchard, and above all by A. Milne-Edwards, and in the equivalent beds of Hampshire. Others have been discovered in Wisconsin; a giant penguin, *Palaeocypus*, is known from New Zealand, and *Palaeospheniscus* from Patagonia. The Miocene has yielded by far the largest number of bird-bones, including even eggs and imprints of feathers. For instance, from the lower Miocene beds of Allier and Puy-de-Dôme Milne-Edwards has described about 50 species. Of these *Palaeolodus* was an ancestral flamingo, but with shorter legs; *Limnornis* is referred to the hoops. The existing genera include *Anas*, *Aquila*, Bubo, Columba, *Cypselus*, *Lanitis*, *Pica*, *Phalacrocorax*, Sula, &c. Very interesting is the fact that *Serpenarius*, *Phalacrocorax* and *Trogons* are amongst this list of birds, which are now restricted to the tropics. A number of these avifauna has been found in the middle-Miocene beds of various other parts of France, Germany and Italy. In Colorado and New Mexico Marsh has detected bones of *Meleagris*, *Phalacrocorax*, *Sula* and *Urria*, all existing genera; but the first is especially significant, since it is one of the most characteristic forms of the New World.

Here may be interpolated a short account of the very peculiar avifauna found in the Tertiary strata of Santa Cruz in Patagonia. Instead of the age of lower Eocene, as had been stated originally, these beds are not older than the middle-Miocene, and not a few of the bones are of a much younger, even latest Tertiary date. Discovered, and partly described, by F. Ameghino, the bones have been sumptuously monographed by F. P. Moreno and A. Merceron, who proposed for them the name of *Stereornithes*, a new order of birds, mostly gigantic in size, and said to combine the characters of Anseres, Herodiones and Accipitres. But the whole mass of bones is in hopeless disorder, apparently without any record of association. At any rate, the "Stereornithes," accepted as such in Bronn's *Thierreich*, and in Newton's *Dictionary of Birds*, had to be dissolved as an unnatural, haphazard assembly. Many of these birds, to judge from the enormous size of their hind-limbs, were undoubtedly flightless, e.g. *Brotornis*, and remind us of the Eocene *Gastornis* of Europe. *Phororhacos*, the most extraordinary of all, belongs to the Gruiformes, perhaps also *Pelecynornis* and *Liornis*. On the other hand, the late Tertiary *Dryornis* is a member of the Cathartae or American vultures, and *Mesembriornis*, likewise of late Tertiary date, is a close forerunner of the recent genus *Rhea*.

Pliocene remains are less numerous than those of the Miocene. From Pirkem in Greece is known a *Gallus*, a *Phasianus* and a large *Grus*. From Samos a large stork, *Amphipélagus*, and a typical *Struthio*; from the Sivalik Hills on the southern flanks of the Himalayas an ostrich, and another Ratite with three toes, *Hyposcelis*, as well as *Lepiopilus*, *Pelecanus* and *Phalacrocorax*. The fossil egg of a struthion bird, *Struthiolithus*, has been found near Cherson, south Russia, and in north China. The Suffolk Craig has yielded the unmistakable bones of an albatross, *Diomedea*. Of the Pleistocene birds are generically, even specifically, identical with recent forms; some, however, have become extinct, or they have become exterminated by man. A great number of birds' bones have been found in caves, and among them some bearing marks of human workmanship. In France we have a large and extinct crane, *Grus primigenia*, but more interesting are the numerous relics of two species, the concomitants even now of the reindeer, which were abundant in that country at the period when this beast flourished there, and have followed it in its northward retreat. These are the snowy owl, *Nyctea scandiaca*, and the willow-grouse, *Lagopus albus*. A gigantic awan, *Cygna fuscorum*, is known from the Zebbug cavern in Malta. From caves of Minas Geraes in Brazil, O. Wing has determined at least 126 species, of which nearly all still survive in the country. Kitchen-middens of England, Ireland and Denmark reveal the existence of the capercally, *Tetrao urogallus*, and of the great auk or gow-fowl, *Alca impennis*; both species long since vanished from those countries. In the fens of East Anglia have been found two humeri, one of them immature, of a true *Pelecanus*, a bird now no longer inhabiting middle Europe.

Until a very recent epoch there flourished in Madagascar huge birds referable to the Raitae, e.g. *Aepyornis maximus*, which laid enormous eggs, and not unnaturally recalls the mythical "roc" that figures so largely in Arabian tales. New Zealand has also yielded many flightless birds, notably the numerous species and genera of *Dinornithidae*, some of which survived into the 19th century (see MOA); *Pseudapertia* allied to the *Kiw;i*; *Cemornis*, a big, flightless goose; *Aptornis* and *Notornis*, flightless rails; and *Hopagornis*, a truly gigantic bird of prey with tremendous wings and talons.

It is, of course, quite impossible, in a survey of extinct birds, to divide them into those which are *borne alive* fossil, sub-fossil, recently extinct and partially exterminated. Nor is it possible, except in a few cases, to decide whether they have come to an end through the agency of man or through so-called natural causes. Like other creatures birds have come, some to flourish and stay, others to die out.

Mauritius is famous for the dodo, killed off by man; there was also a curiously crested parrot, *Lophotisius* (fig. 19). In the Mare aux Songes have been found the bones of another parrot, of ducks, pigeons, rails, herons, geese and of a dwarf darter, *Plautus nano*, all sub-fossil, now extinct. Very interesting is *Aphanapteryx* (fig. 20), a long-billed, flightless rail, practically the same as *Erythromachus* of Rodriguez and *Diaphorapteryx* of Chatham Island. Réunion possessed the peculiar starling, *Fregilupus*. Rodriguez was inhabited by *Peophaps*, the solitaire, *Necropsittacus* and *Palaeornis exilis*, which is now...
probably extinct. The Antilles tell a similar tale. The great auk, once common on the British coasts, those of Denmark, the east coast of North America, then restricted to those of Newfoundland, Greenland and Iceland, has been killed by man, and the same fate has overtaken the Labrador duck, the Phillip Island parrot, Nesiot productus, and the large cormorant of Bering Island, Phalacrocorax perspicillatus; and how long will the flightless cormorant, Ph. harrisii of the Galapagos, survive its quite recent discovery?

**C. GEOGRAPHICAL DISTRIBUTION**

The study of the extinct organisms of any country leads to a proper appreciation of its existing flora and fauna; while, on the other hand, a due consideration of the plants and animals which may predominate within its bounds cannot fail to throw more or less light on the changes it has in the course of ages undergone. That is to say, the distribution of forms in time is a subject so much connected with the distribution of forms in space, that the one can hardly be separated from the other. Granting this is a general truth, it must yet be acknowledged as a special fact, that in fossil birds we have as yet scanty means of arriving at any precise results which will justify bold generalization in the matter of avian distribution. Remains of extinct birds are, compared with those of other classes of vertebrates, exceedingly scarce, and these have been found in very few, widely separated countries. The great problems involved in the study of geographical distribution must therefore be based mainly upon the other classes, both vertebrate and invertebrate, which, moreover, enjoy less great facilities of locomotion than the birds.

Yet it so happens that the great zoogeographical regions of the world, now more or less generally accepted, have been based upon the distribution of birds. The whole subject was properly introduced by Treviranus, who in his large philosophical work devotes considerable space to the "geographical distribution of animals." Next we have to mention F. Tiedemann, the Heidelberg anatomist, who has been generally ignored, although he surpassed many a recent zoogeographer by the wide view he took of the problem; in fact he was the first to connect distribution with environmental or bionomic factors; e.g. the remark on p. 485 of his work that "the countries of the East Indian flora have no kinds of birds in common with America which are vegetable feeders." L. K. Schmarda divided the land into twenty-one realms, characterizing these mainly by their birds. P. L. Sclater was the first to divide the world into a few great "regions," the Palaeartic, Ethiopian, Indian and Australian forming one group, the "Old World" (Palaeogaea); and the Nearctic and Neotropical forming a second, the New World (Neogaea). Birds being of all animals most particularly adapted for extended and rapid locomotion, it became necessary for him to eliminate from his consideration those groups, be they small or large, which are of more or less universal occurrence, and to ground his results on what was at that time commonly known as the order Insetorses or Passeres, comprehending the orders now differentiated as Passeriformes, Coraciformes and Cuciformes, in other words the mass of arboreal birds. His six main divisions—practically adopted by A. R. Wallace in his epoch-making work—are excellent, taken separately. They express the main complexes of land with their dependencies in well-chosen terms; for instance the "Neotropical region" stands short for South and Central America with the Antilles.

But these six divisions of Sclater and Wallace are not all equally valid, only some are of primary importance; they require co- and sub-ordination. This most important advance was made by T. H. Huxley. Some of the "regions" have now to be called subregions, e.g. the Nearctic and the Palaeartic. The reduction of the Oriental to a subregion, with consequent "provincial" rank of its main subdivisions, will probably be objected to, but these are matters of taste and prejudice. Above all it should be borne in mind that nearly all the last subdivisions or provinces are of very little real value and most of them are inapplicable to other classes of animals.

Besides some occasional references in the text, only a few more of the general works dealing with the distribution of birds can here be mentioned. Special attention has to be drawn to the article "Geographical Distribution" in Newton's Dictionary of Birds. See also A. Heilprin, The Zoological and Zoological Distribution of Animals (New York, 1887); W. Marshall and A. Reichenow, two maps with much detail, although badly arranged, in Berghaus' Physikalischer Atlas. vii. Atlas d. Thiereverbreitung. (Gotha, 1887); A. Reichenow, "Die Begrenzung zoogeographischer Regionen von ornithologischen Standpunkte," Zoolog. Jahrb., iii., 1888, pp. 671–704, pl. xxvi.; E. L. Trouessart, La Geographie zoologique (Paris, 1890).

The scheme adopted in the following account stands as follows—

(A) **AUSTRALGAEA or I. Australisian Region**

- Australian
- Papuan
- Antillean
- Colombian
- Patagonian
- Neartic
- Papularectic
- Ethiopian
- Oriental

(B) **NEOGAEA or II. Neotropical Region**

- III. Holarctic Region
- IV. Palaeotropical Region

(C) **ARCTOGAEA**

In the following account the characterization of the various regions and subregions has to a very great extent been derived from Newton's article in his Dictionary of Birds, and from the chapter on distribution in the article on "Birds" in the Encyclopaedia Britannica, 9th edition. This applies especially

2. L. K. Schmarda, Die geographische Verbreitung der Thiere (Wien, 1853).
to those instances in which the members of families, genera, and species are mentioned. The families are those which are enumerated in Garow's classification. The numbers of genera and species of birds are, of course, a matter of personal inclination. If we take a moderate computation the number of recent species may be taken at 10,000–11,000.\(^1\) Dr R. B. Sharpe increases their number to about 15,000 in the *New Hand-List of Birds*, published by the British Museum. In the first two volumes fossil birds, occasionally based upon a fragmentary bone only, are also included.

(A) *Austrogææa*, the Australian region in the wider sense, with the Papuan, Australian and New Zealand subregions, including also Polynesia. We may here quote Newton ([Encyclopaedia Britannica], 9th ed., 'Birds', pp. 736–737) on the remarkable differences between the region and the 'old world':—"The prevalent zoological features of any Region are of two kinds—negative and positive. It is therefore just as much the business of the zoogeographer, who wishes to arrive at the truth, to ascertain what groups of animals are wanting in Australia, as it is the business of the geographer to ascertain what groups of plants are wanting elsewhere, as to determine those which are forthcoming there. Of course, in the former case it would be absurd to regard as a physical feature of any great value the absence of a district of groups which do not occur in the immediate locality (amongst them the Passeres of Europe), but when we find that certain groups, though abounding in some part of the vicinity, either suddenly cease from appearing or appear only in very reduced numbers, and occasionally in abnormal forms, the fact should be of importance. There are some zoological considerations, taken from the situation and configuration of the islands of the so-called Indian or Malay Archipelago, would indicate that they extended in an unbroken series from the shores of the Strait of Malacca to the eastern coast of Australia, but we have reason to believe that of north Australia in Torres Strait, or even farther to the eastward. Indeed, the very name Australasia, often applied to this part of the world, would induce the belief that all the countless islands, both large and small, and some of them among the largest on the globe—were but a southern prolongation of the mainland of Asia. But so far from being the case a very definite barrier is interposed. A strait, some 15 m., or so in width, and separating the two islands, the otherwise insignificant banks of Bali and Lombok makes such a frontier as can hardly be shown to exist elsewhere. The former of these two islands belongs to the Indian Region, the latter to the Australian, and between them there is absolutely no true transition—this, in species common, to both which cannot be explained in any other way than by the various accidental migrations, or migration, that have taken place in the course of time must have tended to mingle the productions of islands so close to one another. The fauna of the two are as absolutely distinct as those of South America and Africa, and it is only in those cases where they are separated by a strait, such as the Bering Sea, that there is a sufficient number of species, which are found on both sides of the strait, to constitute a separate family. Then, of forms which are but weakly represented, we have the other otherwise abundant thrushes (Turdidae), and, above all, the woodpeckers (Picidae), of which only very few species occur, but round the boundary and occurs on Lombok, Celebes or the Moluccas, but are unknown elsewhere in the region."

But the Australian region is also remarkable for its ornithic singularity. All the existing species of the ostriches of Africa and South America, belonging to the genera *Struthio* and *Rhea*, and comprising at most but five species are found in Austrogææa and nowhere else. Of the Passeres the honey-suckers (Meliphagidae) are most characteristic, and, abounding in

---

\(^1\) The following old-fashioned rough computation may serve as an indication of the relative size of the orders and suborders of recent birds:

- Ratitæna...20
- Charadriiformes...650 (incl. Columbæae...350)
- Colymbiformes...20
- Sphenisciformes...15
- Procellariiformes...40
- Columbæae...180
- Anseriformes...150
- Falconiformes...360
- Passeres...1000
- Tinamiformes...40
- Galliformes...370
- Gruiformes...280

Total about 10,300 species

genera and species, extend to almost every part of the region, yet only one species of *Pilolotis* oversteps its limits, crossing the sea from Lombok to Bali. Other peculiar families are much more confined. But the positive characteristics of the region as a whole are not its peculiar families alone: there are at least four families which, being feebly represented elsewhere, here attain the maximum of development. Such are the thick-headed shrikes (*Pachycephalidae*), the caterpillar-eaters (*Campephagidae*), the flower-peckers (*Dicaeidae*), and the swallow-flycatchers (*Articulidæ*). Besides these, three or perhaps four groups, though widely distributed throughout the world, arrive in the Australian region at their culmination, presenting an abundance of most varied forms. These are the weaver-birds (*Ploceidae*), and the moreporks (*Podargidae*), but especially the kingfishers (*Alcedinidae*) and the pigeons (*Columbidae*), the species belonging to the last obtaining in this region a degree of prominence and beauty which is elsewhere unequalled.

The boundaries of the subregions are not well defined. The New Zealand Subregion, considered by Professors Newton and Huxley and various other zoogeographers as deserving the rank of a region, is, and to all appearance has long been, more isolated than any other portion of the globe. Besides the three larger islands—numerous satellites belong to the subregion, as Lord Howe, Norfolk, and Kermadec islands, with the Chatham, Auckland and Macquarie groups. The main affinities of the avifauna are, of course, Australian. The most extraordinary feature is unquestionably the former existence of the extinct Dinornithes or moa (q.v.) and another family of Ratitæna, the weird-looking kiwis or Apteryx, which are totally unlike any other existing birds. Of other peculiar genera it

---

**Fig. 22.—Extinct Phillip-Island Parrot (Nestor productus).** (From specimen in the British Museum. Reduced.)

will suffice to mention only the more remarkable. The *Rallidae* present the very noteworthy woodcocks, *Ocydrontus*, and the takahē, *Notornis*, which is almost extinct. The widely-spread plovers, *Charadriidae*, have two not too singular generic developments, *Thinornis*, and the extraordinary wrybill, *Anarklychnis*. There is an owl, type of the genus *Nestor*. Of parrots, *Strigops*, the kakapo or owl-parrot, is certainly peculiar, while *Nestor* constitutes a peculiar subfamily of the brush-tongued parrots or *Trichoglossidae*. *Xenicus* and *Acanthorhina* form a little family of truly mesomyodean Passeres, *Clamator*. Of the *Meliphagidae* the genera *Prothamaderus*, *Pogonornis*, and *Anthornis* are peculiar. The starlings, *Sturniidae*, are represented by *Calloenas*, *Ceradon*, and the very abnormal *Heterolocha*. The gallinaceous birds are represented by *Nectornis novae-zelandiae*, and the extinct *Woodland Pigeon*, *N. nova-zelandiae*. A large flightless goose, *Cemionyx*, allied to the Australian *Cereopsis*, and the gigantic rapacious *Harpagornis*, have died out recently, with the moa. In all, there is a wonderful amount of specialization, perhaps in a very straight line from generalized forms; but the affinity to Australian or Polynesian types is in many cases clearly traceable, and it cannot be supposed but that these last are of cognate origin with those of New Zealand. A very long period of isolation must have been required to produce the differences so manifestly to be observed, but a few forms seem at rare intervals to have immigrated, and this immigration would appear to be kept up to our own day, as shown by the instance of *Zosterops lateralis*, which is said to have lately made its first appearance, and to have established itself in the country, as well as by the fact of two cuckoos,
BIRD

the widely-ranging Eudynamis taitensis and Clynococcyx lucidus, which are annual visitors.

Polyestina forms, of course, part of Austroaegae. Its extent is so vast that it necessarily contains some peculiar, outstanding forms, so to say forgotten in which their long-continued isolation have specialized themselves. For instance, the kagu (Rhynochos) of New Caledonia, a queerly specialized form with gruine affinities pointing only to South America. The tooth-billed pigeon (Dioonuculus) is restricted to Samoa. The Gould's sandy kiwi (Apteryx afer) is an extraordinary specimen of independence, devoid of Ptila and of Coraciiformes, these islands show an extraordinary development of its peculiar family Dreypanidae, which are probably of South or Central American descent. Acerulacerasius is a Meliphagia, and a peculiar genus. There are a raven species of the little Coraciiformes, but no other species that have been found; also there is a species of the peculiar family Galbulidae, (Bermuda sanderienensis), found now and then domesticated in some; and some flycatchers and thrush-like birds.

The Australian Subregion comprises Australia and Tasmania. One finds, in the south of the continent, as amongst the birds of the tropical regions, where there is a considerable admixture of genera which do not proceed beyond the tropics, and of which such Casuarius is a striking example. The Cape York Peninsula practically belongs to Papuasia. As a whole, Australia is rich in parrots, of which it has several peculiar forms, but Finicals in old-fashioned parlance, of all sorts—certain kingfishers excepted—are few in number, and the pigeons are also comparatively scarce, no doubt because of the many arboreal predators in the country. Among the kingfishers, Adounia and its allies are the only remarkable genera of the Pseudocines, namely the lyre birds (Menura) and the scrub-birds (Atrichia). Among the more curious forms of the land-birds may be especially mentioned the Megapodidae, Lipot and its allies, the Lyre-birds, some Pdoras, and the family of the Paludicidae; the latter, besides their otherwise palaeotropical Turmes in Australia. The possession of bustards (Eupodotis) is a curious example of interrupted distribution, since none other of the Otidae are found nearer South America. The Ratties are represented by two species of emu (Dromaius novaehollandiae), and the extinct Dromornis and Genyornis with its enormous skull.

The Papuan Subregion, chiefly New Guinea, with its dependencies, the Timor group of islands, the Moluccas and Celebes. On the whole, the avifauna presents some very remarkable features. Its most distinctive characteristic is the presence of the birds of paradise, which are almost peculiar to it; also, for granting that the bowler birds, Chlamydolala and others, of Australia, belong to the same family as those of New Guinea, there are less historical and extraordinary forms which are found, within very restricted limits, in the various islands of the subregion. Another chief feature is the extraordinary development of the cassowaries, the richness and variety of the honeyeaters, the development of the sunbirds, and some remarkable flycatchers. It has several marked deficiencies compared with Australia, among which are the bobbies (Timaliidae), weaver birds (Ploceidae), the Platynereis among parrots, diurnal birds of the pigeon family, and the large and brilliant plumage of some peculiar species. The birds of paradise, the raccqet-tailed kingfishers, Tanytysiptera, the largest and smallest of parrots, Calyptorynchus and Niasius, and the great crowned pigeons, Goura, are very characteristic of the region. In the territory of New Guinea, concerning the limits of Central America, between the Bahamas and Florida, and between Grenada and Tobago, the fauna of the Antillean chain, instead of being a mixture of that of the almost contiguous countries, differs also in other parts of South America. It is subdivided into the Neotropical region into sub-regions: the best suggestion is that of Newton: Antillean, with the exception of the islands of Trinidad and Tobago, as well as those of the Caribbean; the Neotropical, concerning the rest of Central America; Patagonian, including Chile and part of Peru: Columbian, comprising the rest of the continent and also Central America.

The Antillean Subregion is in many respects one of the most suggestive and interesting, comparatively small though it be. For example, the avifauna of this region exhibits a greater degree of specialization than that of any other part of South America. As to the birds of the Neotropical region, we find contrasted in many groups a degree of specialization which may be not unlike compared with that of oceanic islands. Except such as are of coral formation, the Antilles are hilly, not to say mountainous, their summits rising in places to an elevation of 2000 feet, and nearly all, price to their occupation as cattle land, covered with luxuriant forest, which, assisting in the collection and condensation of the clouds brought by the trade winds, ensured its own vitality by precipitating frequent and long-continued rains and the continuous soil; whereas, in the case of the Faeroes, an insular fauna, since, making every allowance for the ravages of cultivation by civilized man, the contrary is the case, and possibly no area of land so highly favoured by nature is so poorly furnished with the higher forms of animal life. Here, as over so large a portion of the earth, the wild cattle—a species of Bos primigenius and an inferior class—the scarcity of mammals being accounted for in some measure as a normal effect of insularity.

There is one peculiar subfamily, Todinae, represented by only four species: Todius, with the characteristic of Ratiae, Tinami, Cracidae, Rhamphastidae, and any of those trogoniform genera which are so characteristic of the continent. There is no family of birds common to the Neotropical and the Antillean region. The following are typical of the Neotropical region, a fact which proves its affinity to the latter.

The Patagonian Subregion, most extraordinary, is naturally devoid of a good many typically tropical birds, or these are but few species, and these again exhibit the characteristic of some remote geographical subdivision, the Patagonian, which is so peculiar to this region as to be comprised in a single subregion: La Entomophora, and only a few species, an extraordinary change in the avifauna; one feels that the Old World, beside at least eight which, being peculiar to the New World, extend their range into the Neotropical region, but are there so feebly developed that their origin may be safely ascribed to the southern region. The avifauna of this region is characterized by some extraordinarily beautiful family of humming-birds (Trochilidae), with nearly 150 genera (of which only three occur in the Neotropical region) and more than 400 species. Then the tyrants (Tyrannidae), with more than seventy genera (ten of which range in the northern subregion: Tyrannidae, to the south to the regions of Pteridogaster, and with as many genera, and over 200 species, the ant-thrushes, the finches, the orioles, the sparrow, and the quails; together with other groups which, if not so large as those just named, are yet just as well defined, and possibly more significant, namely, the tapaculos (Pterophiloidea), the toucans (Ramphastidae), the jacamars (Galbulidae), the motmots (Momotidae), the todies (Todidae), the trumpeters (Psophitidae), and the screamers (Palaemonidae); besides such isolated forms as the seriema (Corahina), and the sun-bittern (Eurypygidae).
features of the whole region are here well represented, e.g. Rheas, Tinamou, Chaus, Diddophus, Attajus, Pterochthidae, and indeed some of the best evidence of the antiquity of its population, both recent and extinct (cf. the numerous fossils of the South American avifauna). And also the nearest resemblance to the fauna of Austrogea.

(C) Archigaea is Huxley’s well-chosen term for all the rest of the world (including the Neartic, Palaearctic, Indian and Ethiopian regions) and is well designated. The Palaearctic, however, although not geographically, the Neartic and Palaearctic areas must form the two subdivisions of one great unit, for which the “Holartic region” is now the generally accepted term. The Holartic region comprises North America and the extratropical portion of the Old World, may be defined concerning the point of view be characterized by the Columbidae, Ailuridae, Gallididae, and the Oiseaux, which have reached their highest development; while Ratitae, Tinamit, Psitacit, and non-Neartic, e.g. the parrots extending into North America and Cyanopica carolinensis) are absent.

Neartic Subregion. The close affinity of North America with the Palaearctic avifauna becomes at once apparent if we exclude those birds, or groups of birds, that are of Palaearctic, their original home in the Neotropical region, notably numerous Tyrannidae, humming-birds and the turkey-buzzards.

The following groups may be mentioned as characteristic and typical of the Neartic region: the Tityridae, the Psittacidae, which are the one-third of the genera, and the one-third of the species of birds are represented in the Old by forms so like them that often none but an expert can distinguish them, and of such representative species about 80 might be enumerated (Newton, Dist. Birds of the World, 1885).

Of the many attempts to subdivide the Neartic subregion, the same authority favours that of Dr. S. F. Baird, who distinguishes between Canadian, Alaskan, Boreal, and Mexican faunas. Dr. Hart Merriam takes the broad point of view “that the whole of extratropical North America consists of but two primary life regions, a boreal region, which is circumpolar, and a Sonoran or Mexican tableland region which is unique.” The fixed idea in our minds as to the dominant character of the Neartic and Palaearctic areas. In any case the various Neartic subdivisions completely merge into each other, just as is to be expected from the physical configuration and other biologic coincidences which exist among the American regions.

The Neartic Subregion is, broadly speaking, Europe and Asia, with the exception of India and China. The propertly of comprehending this enormous tract in one zoological “region” was first suggested by the physiographic division of the American continents, the Neartic and Palaearctic regions, and of the same generality and distribution as the Neartic and Palaearctic areas, these being the two portions of the extratropical land mass of the Old World, and the regions in which the Palaearctic and Neartic faunas occur. The Palaearctic region comprises the extratropical portion of the Old World (excluding, of course, the Extratropical or Australian region) into one region, for which Oscar Drude’s well-chosen term “paleotropical” has been adopted (cf. Bronn’s Tierreiche, Systematik, etc.). It is well known that the African and Indian areas, conformably to be called subregions.

Both subregions possess, besides others, the following characteristic birds: Ratitae, viz. Struthio in Africa and Arabia, fossa also in the Madagascan Islands, the Bustard and Numida in Madagascar, the Okapi, Bucorvinae and Upupinae, of which Upupa itself in India, Madagasca and Africa; Coracidae; Pycnonotidae or Bulbuls; Trogonidae, of which the Asiatic genera are the less specialized in comparison to the Neotropical forms; Valeriae; Lepothis, Anastomus and Sylvischelidinae; Tinius; the different kinds of sandpipers and stilts. Of other families which, however, extend their range more or less into the Australian region, may be mentioned Otididae, the bustards; Meropidae or bee-eaters; Muscicapa and Blyth’s sparrows; and numerous others.

The Ethiopian Subregion comprises the whole of Africa and Madagascar, except the Barbary States, but including Arabia; in the north-east the subregion melts into the Neartic between Turkey and the Persian Gulf. Some authors are inclined to extend its limits still farther to the eastwards, through Beluchistan and even beyond the Indus.

So large a portion of the Ethiopian subregion lies between the tropics, viz. Madagascar, and it is grouped under the Palaearctic and Neartic faunas of the East Indies, its limits still farther to the eastwards, through Beluchistan and even beyond the Indus.

Between fifty and sixty so-called families of land birds alone are found within its limits, and of them at least nine are peculiar: the Francolinidae, the Cat Coraciidae, and the Picidae of the northern forests, the Phasianidae, the Pavo, the Lophophoridae, the Palaearctic and Neartic faunas of the East Indies, its limits still farther to the eastwards, through Beluchistan and even beyond the Indus.

The natural division of the subregion is that into an African and a Madagascar province. Subdivision of the continental portion is beset with great difficulties, and none of the numerous attempts have proved long-lived. The faunistic division of the continent is in opposition to the rest.

The Malagasy province comprises, besides Madagascar, the Mascarene, Comoro and Seychelles islands. It may be safely defined as the cosmopolitan portion of the tropical portion of the Palaearctic, it is more or less isolated from its parent stock, and its avifauna is one of the best examples of a natural and especially of its ornithic population, New Zealand cannot be compared with it. In A. Granddier’s magnificent Histoire physique, naturelle et politique de Madagascar, 1879, are enumerated 358 species belonging to the island, of which 29 are peculiar to it, and among those are fewer than 35 peculiar genera. Eucyrophes of the
Oseines, and Philipita of the Clamatores, are remarkable enough to form the types of Passeriform families, and Mesites half-way between Galli and Gruiformes is of prime importance. The Passerine Falcula, with its recently extinguished allies Frigilupus and Necropsar of the Mascarenes; the Coracine Brachypteryx, Aedon in little Pratincola, genera, are very abundant, while Helodius is an owl belonging to that subfamily which is otherwise represented only by the widely-spread barn owl, Strix flammia. Lastly must be noted the extinct tall Ratite species of Aepyornis with its several fancy genera. But, as Newton charmingly puts it (Dist. Birds, p. 335), the avifauna of Madagascar is not entirely composed of such singularities as these. We have homely genera, even among the true Passeres, occurring there—such as Alauda, Acrocephalus, Motacilla and Pratincola, while the Cisticola madagascariensis is only distinguishable from the well-known fan-tailed warbler, C. schauinslandi of Europe, Africa and India by its rather darker coloration. But there are also species, though not Passerine, which are absolutely identical with those of Britain, the barn owl, common quail, pigny rail, and little goby or dabchick, all of them common and apparently resident in the island. Mauritius had the dodo (q.v.), Lophotisitus and Aphomapteryx. Rodriguez had the solitaire, Necropsittacus and Necropsar. Bourbon or Réunion had Frigilupus.

Some of the Malagasy avifauna is certainly ancient, aboriginal, and even points to India; other forms indicate clearly their African origin; while, lastly, such strikingly characteristic Indo-African birds as hornbills are unaccountably absent.

The Oriental Sub-division comprises all the countries and numerous islands between the Palaearctic and Australian areas; it possesses upwards of seventy families, of which, however, only one is peculiar, but this family, the Eurylaimidae or broadbills, is of great importance since it represents all the Subalatores. Of the many characteristic birds may be mentioned Pycnonotidae or bulbuls, of which the Phylornithinae are peculiar, Campophaenidae or cuckoo-shrikes, Dicruridae or drongos, Nectariniidae or sunbirds; pigeons, together with Pavo and Ocyphon; fantails; and the similarities to the Ethiopian and the great differences from the Australian avifauna have already been pointed out. Naturally no line whatever can be drawn between the Oriental and the Palaearctic subregions, and many other essentially Indo-Malayan families extend far into the Australian realm, far across Wallace's line, whilst the reverse takes place to a much more moderate extent. Certainly the Oriental area, in spite of its considerable size, cannot possibly claim the standing of a primary region. It is a continuation of the great Aegrotos into the tropics.

Following H. J. Elwes we subdivide the whole subregion into a Himalo-Chinese, Indian and Malayan province. These divisions had the approval of W. T. Blanford, who proposed the terms Cis- and Trans-gangetic for the two first. The Himalo-Chinese or Trans-gangetic province shows the characteristics of its avifauna also far away to the eastward in Formosa, Hainan and Cochín China, and again in a lesser degree to the southwest in the mountains of Malacca and Sumatra. Indo-China is especially rich in Eurylaimidae, China proper and the Himalayas in pheasants.

**FIG. 23.—Extinct Starling of Réunion (Frigilupus varius), adapted from figures by Danbenton, Lewallant and others. Reduced.**

The Indian or Cisgangetic province is the least rich of the three so far as peculiar genera are concerned.

The Malay province comprising the Malay islands, besides the Malay peninsula, and the very remarkable Philippines, possess an extraordinary number of peculiar and interesting genera.

The influence of the Australian realm is indicated by a Megapode in Celebes, another in Borneo and Labuan, and a third in the Nicobar islands (which, however, like the Andamans, belong to the Indian province), but there are no cockatoos, these keeping strictly to the other side of Wallace's line, whence we started on this survey of the world's avifauna.

**D. CLASSIFICATION OF BIRDS**

Fübringer's great work, published in the year 1888 by the *Natura Artis Magistra* Society of Amsterdam, enabled Gadow not only to continue for the next five years the same lines of morphological research, but also to further investigate those questions which were still left in abeyance or seemed to require renewed study. The resulting "classification is based on the examination, mostly autopic, of a far greater number of characters than any that had preceded it; moreover, they were chosen in a different way, discernment being exercised in sifting and weighing them, so as to determine, so far as possible, the relative value of each, according as that value may vary in different groups, and not to produce a mere mechanical 'key' after the fashion become of late years so common" (Newton's *Dictionary of Birds*, Introduction, p. 103). It is not the quantity but the quality of the anatomical and bionomic characters which determines their taxonomic value; and a few fundamental characters are better indications of the affinities of given families of birds than a great number of agreements if those can be shown to be cases of isomorphism or heterophyletalic, convergent analogy. Nature possesses three very great educational or developmental schools—terrestrial, aquatic and aerial life. Each of these affords animal, vegetable or mixed diet. Animal diet implies the greatest variety with regard to locality and the modes of procuring the food. Each of these schools impresses its pupils, in the case of the birds, with its own stamp, but there are many combinations, since in the course of phylectic development many a group of birds has exchanged one school for another. Originally terrestrial groups have taken to an entirely aquatic life, and vice versa; others, originally endowed with the power of flight, have become, or are transforming themselves into, absolutely cursorial forms; some members of one group live entirely on seeds, while others have become fierce fishers, and so forth. Only by the most careful inquiry into their history can their relationship or pedigree be unravelled. A statement may now be given of Gadow's classification of birds, in which the extinct forms have been intercalated so far as possible. The few characters assigned to the various groups are sufficiently diagnostic when taken together, although they are not always those upon which the classification has been established:

### CLASS AVES

I. Sub-class Archaeornithes.—The three fingers and their metacarpals remain separate, each with a claw. Well-developed remiges. Both jaws with alveolar teeth. Amphicoelous. Caudal vertebrae more than thirteen, without a pygostyle, but with about twelve pairs of rectrices. Archaeopteryx, *A. lithographica*, *s. maccoura*, two specimens from the upper Oolite of Solenhofen, Bavaria.

II. Sub-class Neornithes.—Metacarpals fused. Second finger the longest. Not more than thirteen caudal vertebrae.

2. Order Struthiones.—With pubic symphysis. Two toes only, third and fourth. *Struthio* ostrich, Pliocene of Samos and of north-west India, now Africa and Arabia.

6. Order **Aepyornith**.—Aepyornis, recently extinct, Madagascar.

To the Ratitae belong possibly also the imperfectly known *Diotryma*, Eocene of New Zealand, *Gastornis* and *Dasornis*, Eocene of Europe, *Gyornis*, Pleistocene of Australia.

III. Division **Carninata**.—With keeled sternum.

2. Order **Colymbiform**.—Plantigrade, nidifugous, aquatic. All toes webbed, fourth largest, hallux short; metatarsus laterally compressed; tibia with high, pyramidal crest. Bill straight, pointed, with simple sheath.

Sub-order 1. **Colymbi**. Diver; toes completely webbed. Holarctic. *Colymbus*, Arctic.

5. Order **Ciconiiform**.—Swimmers or waders. Desmognathous, with simple basipterygiid processes; with one pair of sternoo-tracheal muscles.

Sub-order 1. **Steganopodi**.—Well flying, aquatic, nidicolous; with all the four toes webbed together. Rhamphothectori compund; cosmpolitan. *Phaethon*, tropic-bird; *Sula*, gannet; *Phalacrocorax*, coromant and *Pelecanus*, snake-bird; *Fregata*, frigate-bird; *Pelicanus*. Here also *Pelagornis*, Moene of France; *Arguillornis* and probably *Odontopteryx* from the London Clay.

6. Order **Anatiform**.—Desmognathous, nidicolous; with two pairs of sternoo-tracheal muscles, with complete basipterygiid processes and with a penis.

Sub-order 4. **Anseriformes**.—Without long spinea externa; without basipterygiid processes. *Opisthocomus* hoazin, Guiana, Venezuela, and Amazon countries.

12. Order **Cuculiform**.—Desmognathous, nidicolous; zygodactylous, with the outer toe reversible.

Sub-order 1. **Cucul**.—Cuculls. Quinto-cubital. *Cuculidae*, cosmopolitan, plantain-eaters and touracos, Ethiopian since Miocene.

Sub-order 5. **Coli**.—Mouse-birds. First and fourth toes reversible. Ethiopian.

BIRD-LOUSE—BIRDS OF PARADISE

Sub-order 7. Picci.—Zygodyctylus. Tendon of the flexor hallucis longus muscle sending a strong vinculum to that of the flexor profundus muscle, the tendon of which goes to the third toe only. Gallinulidae, puff-birds and the Cucullaeidae. Capitonidae, barbets, tropical. Rhynchoptilidae, toucans, neotropical. Picidae, woodpeckers, cosmopolitan, excepting Madagascar and Australian region.

Sub-order 2. Passeres. Diacromyidae.—Syrrine muscles of either side attached to the dorsal and ventral corners of the rings. Hallux strong, with a large claw. (1) Suboxinas with Menura, lyre-bird, and Atrichia, scrub-bird, in Australia. (2) Ocsines, the true singing-birds, with more than 5000 recent species, are mostly divided into some thirty "families," few of which can be defined.

The four orders of the Carinae are further congregated into four "Legions":—

1. COLUMBOMORPHA = Ichthyornithes + Columbiiformes + Sphenisciformes + Procellariiformes. (1)
2. PELARGOMORPHA = Ciconiiformes + Anseriformes + Gruiformes. (2)
3. ALECTOROMORPHA = Tinamiformes + Galliformes + Gruiformes + Charadriiformes. (3)
4. CORACIOMORPHA = Cuculiformes + Coraciiformes + Passeriformes. (4)

These four legs are again combined into two "Brigades," the first of which comprises the first and second legions, while the second brigade contains the third and fourth legions. Thus the whole classification becomes a rounded-off phylogenetic system, which, at least in its broad outlines, seems to approach the natural system, the ideal goal of the scientific ornithologist. The main branches of the resultant "tree" may be rendered as follows:—

CORACIOMORPHA

ODONTOLCAE, COLYMO + PELARGO = ALECTOROMORPHA + RATTAE = MORPHAE

NEORNITHES

The Odontolcae seem to be an early specialized offshoot of the Columba-Pelecanoid gang, while the Rattae represent a number of side branches of early Alectoromorpha. The Rattae branched off, probably during the Eocene period, from that still indifferent stock which gave rise to the Tinamii-Gallii + Gruiformes, when the members of this stock were still in possession of those archaic characters which distinguish Rattae from Carinate. It follows that new groups of Rattae can no longer be developed since there are no Carinatea living which still retain so many low characters, e.g., configuration of the tail, precocaroid, pelvic, intestinal convolutions, copulatory organ, &c. Loss of the keel is co-ordinated with the power of using the forelimbs for locomotion; although a Rattae character, it is not sufficient to turn a Naturoidea, Cennorhina or Streptopelia into a member of the Rattae.

Another branch of the Alectoromorpha, in particular of the Gruiformes, when these were still scarcely separated from the Gruiformes, especially rail-like birds, leads through Upiscomi to the Paridae, which is not yet an Alectoromorpha. From this ascending stem the Alectoromorpha are connected with the Coraciiformes, out of which have arisen the Passeriformes, and these have blossomed into the Osciines, which, as the apothecis of bird life, have conquered the whole inhabitable world. (H. F. C.)

BIRD-LOUSE, any small flat degenerate wingless neopterous insect of the group Mallophaga, parasitic upon birds and mammals and feeding upon dermal excretions or upon the softer parts of hair and feathers. The term "biting lice" is sometimes given to these parasites, in allusion to the mandibulate character of their mouth-parts, which serves to distinguish them at once from the true lice of the order Rhynchota in which the jaws are haustralate.

BIRD’S-EYE, a name applied to various small bright flowers, especially those which have a small spot or "eye" in the centre. The primula is thus spoken of, on account of its yellow centre, also the adonis, or "pleasing eye," and the blue veronica, or germander speedwell. The word is also applied to a sort of tobacco, in which the stalks (of a mottled colour) are cut up together with the leaves. From a similar sense comes the phrase "bird’s-eye maple," a speckled variety of maple-wood, or the "bird’s-eye handkerchief" mentioned in Thackeray's novels.

BIRDSESTING, a general term for the pursuit of collecting and preserving birds’ eggs, with or without the nests themselves. The nests and eggs of wild birds are nowadays protected by local laws almost everywhere in both Great Britain and the United States. By law they may be taken for scientific purposes only, by special licence. In order not to interfere seriously with breeding it is customary to take but one egg from a nest, and, if the nest itself be taken, to wait until the young birds have left it. Every egg, unless "blind" or "sheet" is removed from the nest. This is done by opening a small hole in its side by means of a drill with a conical head, manufactured for the purpose, a minute hole for the insertion of the drill-head having first been made in the shell with a needle, which is then used to stir up the contents, so that they shall flow easily. A blow-pipe with a curved mouth is then inserted, the egg is held hole downwards, and the contents blown out. The old-fashioned method of making two holes in the egg is thus superseded. Should the egg be "hard-set" a somewhat larger hole is made and its edges reinforced with layers of paper pasted round them. Minute forceps are then introduced and the embryo cut out pieces small enough to pass through the hole. The inside of the egg is then rinsed out with clean water, and also before being placed in the cabinet, with a solution of corrosive sublimate, which makes the eggs decay and consequent decoloration of the inner membrane. Finally the egg is placed with the hole downwards upon a sheet of white blotting-paper to dry. The authentication of the eggs is the most important duty of an egg-collector, next to identifying the specimens. According to some the best method is to mark with a fine pen on the egg itself the variety, scientific name, locality of nest, date of taking and the initials of the collector, as well as a reference to his note-book or catalogue. Others advocate keeping the authentication separate with only a numbered reference on the egg itself. Eggs should not be transported in bran or sawdust, but in strong wool-lined boxes. The best cabinets are fitted with drawers, pulled out to inspect the eggs, but at other times closed to preserve them from the light, which is injurious to their delicate colouring.

When an entire nest is taken it should be disinfected with hypo-iodite or soda or insect powder.

See Birdnesting and Bird-Skinning, by E. Newman (London, 1888); The Young Collector's Handbook of British Birds' Nests and Eggs, by W. H. Bath (London, 1888); Birds' Nests, Eggs and Egg-Collecting, by R. Keas (Auckland, 1890); Bird Blowers' Eggs 'as' Eggs, by J. C. Atkinson (London, 1890); Nests and Eggs of North American Birds, by Ernest Ingersoll (1880-1881).

BIRDS OF PARADISE, a group of passerine birds inhabiting New Guinea and the adjacent islands, so named by the Dutch voyagers in allusion to the brilliancy of their plumage, and to the current belief that, possessing neither wings nor feet, they passed their lives in the air, sustained on their ample plumes, resting only at long intervals suspended from the branches of leafy trees by the wire-like feathers of the tail, and drawing their food "from the dews of heaven and the nectar of flowers." Such stories obtained credence from the fact that so late as the year 1760, when Linnaeus named the principal species apoda, or "footless," no perfect specimen had been seen in Europe, the natives who sold the skins to coast traders invariably depriving them of feet and wings. The birds now usually included under this name belong to the family Paradisidae, closely allied to the crows. The largest is the great emerald bird (Paradisaea apoda), about the size of the common jay. Its head and neck are covered with short thick-set feathers, resembling velvet pile, of a bright straw colour above, and a brilliant emerald green beneath. From under the shoulders on each side springs a dense tuft of golden-orange plumes, about 2 ft. in length, which the bird can raise at pleasure, so as to enclose the greater part of its body. The
two centre tail feathers attain a length of 34 in., and, being desti-
tute of webs, have a thin wire-like appearance. This splendid
plumage, however, belongs only to the adult males. The females
being, excepting plain birds of a nearly uniform dusky brown
colour, and possessing neither plumes nor lengthened tail feathers.
The young males at first resemble the females, and it is only
after the fourth moultling, according to A. R. Wallace, who has
studied those birds in their native haunts, that they assume
the perfect plumage of their sex, which, however, they retain
permanently afterwards, and not during the breeding season
only as was formerly supposed. At that season the males
assemble, in numbers varying from twelve to twenty, on certain
trees, and there disport themselves, so as to display their mag-
nificent plumes in presence of the females. Wallace in his
Malay Archipelago, vol. ii., thus describes the attitude of the
male birds at one of those "sacaleti," or dancing parties, as the
natives call them; "their wings," he says, "are raised vertically
over the back, the head is bent down and stretched out, and
the long plumes are raised up and expanded till they form two
magnificent golden fans striped with deep red at the base, and
fading off into the pale brown tint of the finely-divided and
softly-waving points; the whole bird is then overshadowed
by them, the crouching body, yellow head, and emerald green
throat, forming the foundation and setting to the golden glory
which waves above." It is at this season that those birds are
chiefly captured. The bird-catcher having found a tree thus selected
for a "dancing party," builds a hut below the lowest branches in
which to conceal himself. As soon as the male birds have begun their
graceful antics, he shoots them, one after the other, with blunt arrows, for the purpose of stunning
and bringing them to the ground without drawing blood, which
would injure their plumage; and so eager are those birds in their
courtship that almost all the males are thus brought down
before the danger is perceived. The natives in preparing
the skins remove both feet and wings, so as to give more prominence to
the commercially valuable tuft of plumes. They also remove
the skull, and the skin is then dried in a smoky hut. The great
emerald bird, so far as yet known, is only found in the Aru
Islands. The lesser bird of paradise (Paradisea minor), though
smaller in size and somewhat less brilliant in plumage, in other
respects closely resembles the superior species. The plumes are
more common, and much more widely distributed, being found throughout
New Guinea and the neighbouring islands. Its plumes are those most generally used as ornaments for ladies'
head-dresses. Both species are omnivorous, feeding voraciously
on fruits and insects. They are strong, active birds, and are
believed to be polygamous. The king bird of paradise (Cicin-
nurus regius) is one of the smallest and most brilliant of the
group, and is specially distinguished by its two middle tail
feathers, the ends of which alone are webbed, and coiled into a
beautiful spiral disk of a lovely emerald green. In the red
bird of paradise (Paradisea rubra) the same feathers are greatly
elongated and destitute of webs, but differ from those in the other
species, in being flattened out like ribbons. They are only found
in the small island of Waigu off the coast of New Guinea.
Of the long-tailed paradise birds the most remarkable is that known
as the "twelve-wired" (Seleucides alba), its delicate yellow
plumes, twelve of which are transformed into wire-like bristles
nearly a foot long, affording a striking contrast to the dark
metallic tints of the rest of its plumage.

BIRDWOOD, SIR GEORGE CHRISTOPHER MOLESWORTH (1832— ), Anglo-Indian
official and writer, son of General
Christoph Birdwood, was born at Belgum, in the Bombay
presidency, on the 8th of December 1832. He was educated
at Plymouth grammar-school and Edinburgh University,
where he took his M.D. degree. Entering the Bombay
Medical Service in 1854, he served in the Persian War of 1856-57,
and subsequently became professor at the Grant Medical
College, registrar of the university, curator of the museum, and
sheriff at Bombay, besides acting as secretary of the Asiatic
and Horticultural societies. His work on the Economic Vegetable
Products of the Bombay Presidency reached its twelfth edition
in 1868. He interested himself prominently also in the municipal
life of the city, where he acquired great influence and popularity.
He was obliged by ill-health in 1868 to return to England, where
he entered the revenue and statistics department of the India
Office (1871-72). Whilst engaged there he published two
important volumes on the industrial arts of India, the ancient
records of the India Office, and the first letter-book of the East
India Company. He devoted much time and energy to the
couragement of Indian art, on various aspects of which he
wrote valuable monographs, and his name was identified with
the representation of India at all the principal international
exhibitions from 1857 to 1901. (See Journal of Indian Art, vol.
vi. "The Life and Work of Sir George Birdwood"). His
researches on the subject of incense (Trans. Linn. Soc. xxvii.,
1871; Ency. Brit. 9th ed., "Incense," 1881; revised for
the present edition by him), a good example of his mastery of
detail, have made his historical and botanical account of this
subject a classic. Nor can his lifelong association with journal-
ism of the best sort be overlooked. From boyhood he was
a diligent contributor of special information to magazines
and newspapers; in India he helped to convert the Standard into
the Times of India, and edited the Bombay Saturday Review;
and after his return to London he wrote for the Fortnightly
Mall, Athenaeum, Academy, and Times; and with Chenery, the editor
of The Times, and others he took the initiative (1882) in cele-
brating the anniversary of Lord Beaconsfield's death as "Prim-
rose Day" (April 15). He kept up his connexion with India
by constant contributions to the Indian press; and his long
friendships with Indian princes and the leading educated native
Indians made him intimate knowledge of the country of peculiar
value in the handling of the problems of the Indian empire.
In 1857 he was created a K.C.I.E.; and, besides being given his
LL.D. degree by Cambridge, he was also made an officer of the
Legion of Honour and a laureate of the French Academy.
BIREJIK (Arab. Bir; classical, Apamea-Zeugma), a town
of North-West Mesopotamia, in the Aleppo vilayet, altitude 1170 ft.,
built on a limestone cliff 400 ft. high on the left bank of the
Euphrates. Pop. about 10,000, three-quarters Moslem. It is
situated at one of the most important crossings of the Euphrates,
where there was, in ancient times, a bridge of boats, and is now
a ferry on the road from Aleppo to Urfa, Diarbekr and Mosul.
Birejik corresponds actually to Apamea, which lay opposite
Zeugma, and commanded the bridge with its strong castle
(Kala Beda) now much ruined. The place seems to have had
a pre-Seleucid existence as Bitha, a name which revived under
Roman rule (we hear of the emperor Julian resting there on his
march into Mesopotamia, a.d. 363), and is preserved to this
day. The ferry over an unusually deep and narrow part of
the Euphrates has been used from time immemorial in the passage
from North Syria to Haran (Charræe), Edessa and North Meso-
potamia, and was second in importance only to that at
Thapsacus, by which crossed the route to Babylon and South
Mesopotamia. Birejik was the scene of an unusually cruel
massacre and persecution of Armenians in 1895.
BIREN (or BØHHEN), ERNST JOHANN (1600-1772), duke of
Courland, was the grandson of a groom in the service of Duke

Standard Wing Bird of Paradise
(Semioptera wallacei),
Jacob III. of Courland, who bestowed upon him a small estate, which Biren's father inherited and which Biren himself was born. He received what little education he had at the academy of Königsberg, from which he was expelled for riotous conduct. In 1714 he set out to seek his fortune in Russia, and unsuccessfully solicited a place at the shabby court of the princess Sophia Charlotte, the consort of the tsar of Alexis. Returning to Mittau, he succeeded in gaining a footing at court there through one of his sisters, who was the fancy of the ruling minister, Peter Bestuzhev, whose established mistress was no less a person than the young duchess Anna Ivanovna. During his patron's absence, Biren, a handsome, insinuating fellow, succeeded in supplanting him in the favour of Anne, and procuring the disgrace and banishment of Bestuzhev and his family. From henceforth to the end of her life Biren's influence over the duchess was paramount. On the elevation of Anne to the Russian throne in 1740, Biren, who had in the meantime married a Fräulein von Treiden, came to Moscow, and honours and riches were heaped upon him. At the coronation (19th May) he was made grand-chairman, a count of the empire, on which occasion he is said to have adopted the arms of the French ducal house of Calavarie, with an estate at Wenden of 10,000 acres with 50,000 crows a year. He soon made himself cordially detested by Russians of every class. He was not indeed the monster of iniquity he is popularly supposed to have been. His vices were rather of the sordid than of the satanic order. He had insinuating manners and could make himself very agreeable if he chose; but he was mean, treacherous, rapacious, suspicious and horribly vindictive. During the latter years of Anne's reign, Biren increased enormously in power and riches. His apartments in the palace adjoined those of the empress, and his liveries, furniture and equipages were scarcely less costly than hers. Half the bribes intended for the Russian court passed through his coffers. He had landed estates everywhere. A special department of state looked after his brood mares and stallions. The magnificence of his plate astonished the French ambassador, and the diamonds of his duchess were the envy of princes. The climax of this wondrous elevation was reached when, on the extinction of the line of Kettler, the estates of Courland, in June 1777, elected him their reigning duke. He was almost as much loathed in Courland as in Russia; but the will of the empress was the law of the land, and large sums of money, smuggled into Courland in the shape of bills payable in Amsterdam to bearer, speedily convinced the electors. On her death-bed Anne, very unwillingly and only at his urgent entreaty, appointed him regent during the minority of the baby emperor, Ivan VI. Her common-sense told her that the only way she could save the man she loved from the vengeance of his enemies after her death was to facilitate in time his descent from his untenable position. Finally, on the 26th of October 1740, a so-called "positive declaration" signed by 104 dignitaries, in the name of the Russian nation, conferred the regency on Biren.

Biren's regency lasted exactly three weeks. At midnight of the 10th of November 1740 he was seized in his bedroom by his ancient rival, Field Marshal Münich. The commission appointed to try his case condemned him (11th of April 1741) to death by quartering, but the sentence was commuted by the clemency of the new regent, Anna Leopoldovna, the mother of Ivan VI., to banishment for life at Pelin in Siberia. All Biren's vast property was confiscated, including his diamonds, worth £600,000. For twenty-two years the ex-regent disappeared from the high places of history. He re-emerges for a brief moment in 1762, when the philo-German Peter III. summoned him to court. He was now too old to be in any one's way, and that, no doubt, was the reason why Catherine II. re-established him (1763) in his duchy, which he bequeathed to his son Peter. Misfortune had chastened him, and the last years of his rule were just and even benevolent, if somewhat autocratic. He died at Mittau, his capital, on the 28th of December 1772.

**BIRETTA** (Ital. *berretta*, Med. Lat. *biretum*, *biretum*, dim. of *birex*, "a hooded cloak"); from the Fr. *form biretum* is derived the Eng. "barret-cap"); a cap worn by the Catholic clergy. It is square and stiff, being made of a framework of cardboard covered with cloth or silk; on the top, along the sutures of the stuff, are three or four raised, board-like, arched ridges, at the junction of which in the centre is a knob or tassel (*focussus*). Its colour varies with the rank of the wearer, that of the pope being, of the cardinals red, of bishop purple, and of the lower clergy black. It is not in the strictest sense a liturgical head-dress, its use not being confined to liturgical functions. In these functions, moreover, its use is strictly limited; e.g. it is worn at low masses by the priest only when he goes to and from the altar, at high masses also when the celebrant sits during the singing of the *Kyrie*, *Gloria* and *Creed*, and at processions when these take place outside the church and are not sacramental, and so on.

Though the form of the biretta, devised in the 17th century, is peculiar to the Roman Church, it is but a variant of the original *biretum*, which developed in various countries, as a head-covering of different shapes and significance. At the outset there was little to distinguish the *biretum* from the *pileus* or *pileolus* (skull-cap), a non-liturgical cap worn by dignitaries of the Church under the mitre and even under the biretta. When the word *biretum* first appears in the 15th century, it practically means no more than "cap," and is used as a synonym of *pileus*. As an ecclesiastical vestment the cap can be traced, under the name of *pileus*, to the 12th century; under that of *infusa*, to the end of the 10th. It would seem to have been worn by the canons as a protection against cold. The same utilitarian reason led to its introduction among the clergy generally. Thus in 1243 Pope Innocent IV. granted leave to the Benedictines of St. Augustine's at Canterbury, and to those of Winchester, to wear the *pileus* in choir. With the extension of its use, too, the custom grew (*c. 1300*) of investing clerks with the *biretum* as the symbol of the transfer of a benefice, a custom which survives, in Roman Catholic countries, in the solemn delivery of the red biretta by the head of the state to newly created cardinals, who afterwards go to Rome to receive the red hat.

This red biretta is called the *zucchetto*. This use of the *biretum* as a symbol of office or dignity was not confined to the clergy. With various modifications of form it was worn by all persons of standing, e.g. barons, judges, and doctors and masters of the universities. The *biretum* was also used in the investiture of laymen with office, e.g. a duke or the prefect of the city of Rome (Du Cange, *Gloss. s.v. biretum*). The "cap of maintenance" or "cap of estate," still borne before the British sovereign on state occasions, is a baret-capp of the type of the 14th and 15th centuries; it is of crimson velvet, turned up with ermine. By the 16th century the baret-cap had become the common head-gear of all people of substance, men and women. It was flat, square or round, sometimes with edges that could be turned up or down according to convenience, and was often elaborately decorated. By the 17th century it had given place in ordinary civil life to the round hat; but in various shapes it still survives as official head-gear in many European countries: the *Bareti*, worn in church by the Lutheran clergy, in the courts by German lawyers, and by the deans and rectors of the universities, the *barrette* of French judges and barristers, the "black cap" of the English judge, and the "college cap" familiar in English and American universities, and vulgarly known as the "mortar-board."

Meanwhile the ecclesiastical developments of the *biretum* are not without interest and significance. Originally this had been a round cap, low or moderately high, slightly bulging out at the top, and ornamented with a round knob. By the 16th century, both in England and on the continent, a tendency had begun to emphasize the ridges of the sutures and thus produce a square shape. Henceforth the evolution followed different lines. In England, in the 17th century, the square flat top began to be
enlarged, forming a rim of thick stuff projecting beyond the close-fitting cap. This was the "square cap" so virulently denounced by the Puritans as a symbol of High Church Erastianism. With the triumph of High Church principles at the Restoration it was natural that a loyal clergy should desire to emphasize this squareness, and the consequent exaggeration of the square top of the cap necessitated a further stiffening. In the 18th century, accordingly, the top began to be made of a board of wood or card covered with cloth, the close-fitting cap proper retailed farther from the edges, the knob developed into a long tassel, and the evolution of the modern "college cap" was complete (see fig. 1).

On the continent, meanwhile, in the Roman Catholic Church, the biretum had also developed into its present characteristic form, and by a very similar process. By the end of the 16th century the square shape was everywhere prevalent; at the beginning of the 17th century cardboard was introduced to stiffen the sides and emphasize the squareness, and the actual form of the biretta, as described above, had become fixed (see fig. 2). Only in Spain has the biretta continued to be worn without the raised ridges.

The use of the Roman biretta has been introduced by a certain number of the clergy into the Anglican Church. It is clear that there is no historical justification for this; for though both college cap and biretta are developed from the same "square cap," the biretta in its actual shape is strictly associated with the post-Reformation Roman Church, and its actual ceremonial use is of late growth. Braun (Liturgische Gewandung, p. 513) thinks that the symbolism of the cross may have had some influence in fixing and propagating the square shape, and he quotes a decree of the synod of Aix (1585) ordering the clergy to wear a biretta sewn in the form of a cross (biretum in modum crucis formatum, ut ecclesiasticae haereticae deni seque). So far as the legality of the use of the biretta in the Church of England is concerned, this was pronounced by Sir R. Phillimore in the Court of Arches (Elphinstone v. Purchas, 1870) to be legal "as a protection to the head when needed," but this decision was reversed on appeal by the judicial committee of the privy council (Hebbert v. Purchas, 1871). Of late years the old square cap of soft padded cloth or velvet has been revived in the Anglican Church by some dignitaries.

See J. Braun, S. J., Die liturgische Gewandung (Freiburg-i-B., 1907); Hierurgica Anglicana, part ii. (London, 1903); H. Druitt, Costume on Brasses (London, 1906). (W. A. P.)

BIRGER (1250) Birger's son Valdemar was elected king while his father acted as regent. During the sixteen years of his sway Sweden advanced greatly in fame and prosperity. In 1323 he led an expedition to Finland, built the fortress of Tavastehus, and thus laid the foundations of Sweden's overseas empire. He also built Stockholm, and enriched it by making it the chief mart for the trade of Lübeck, with which city he concluded a commercial treaty. As a lawgiver also Birger laboured strenuously in the interests of civilization. In his old age he married the daughter of King Abel. There is a fine statue of the great jarl in the Riddarholm church at Stockholm, erected by Fogelberg at the expense of the Stockholm magistracy in 1884. He is also the central figure of Fr. Hedberg's drama Birgitt på Uljåsa (1865). See Sveriges Historia, vol. i. (Stockholm, 1879-1883).

BIRIBI, or CAVAGNONE, a French game of chance, prohibited by law since 1837. It is played on a board on which the numbers 1 to 70 are marked. The players put their stakes on the numbers they wish to bet on. The banker is provided with a bag from which he draws a case containing a ticket, the tickets corresponding with the numbers on the board. The banker calls out the number, and the player who has backed it receives sixty-four times his stake; the other stakes go to the banker. In the French army "to be sent to Biribi" is a cant term for being sent to the disciplinary battalion in Algeria.

BIRJEND, the capital of Kānn, a sub-province of Khorasan in Persia, in 32° 53' N. 59° 10' E., and at an elevation of 4550 ft. Pop. about 25,000. It is situated 328 m. from Meshed by the direct road, in a fertile valley running east and west, of which the southern boundary is a lofty range of barren hills known as Kuh-i Bākeran. Through the valley runs the Khup river, which loses itself in the desert towards the west; it is, however, generally dry. The water-supply of the town and of the 70 or 80 villages under its jurisdiction is very scanty. On the east of the town at the foot of a hill stands a dilapidated fort. Birjend has six good caravanserais, a college and some mosques; post and telegraph offices were established there in 1902.

BIRKBECK, GEORGE (1776-1841), English physician and philanthropist, was born at Settle in Yorkshire on the 17th of January 1776. He early evinced a strong predilection for scientific pursuits; and in 1799, after graduating as doctor of medicine, he was appointed to the chair of natural philosophy at the Andersonian Institution of Glasgow. In the following year he delivered, for the benefit of the working-classes, a gratuitous course of scientific lectures, which were continued during the two following years and proved eminently successful. He removed to London in 1804, and there he endeavoured to prosecute his philanthropic schemes, at first without much encouragement, but ultimately with marked success. In 1823 he contributed to found the Mechanics' Institute, the name of which was afterwards changed to Birkbeck Institution or College, in honour of its founder. He was appointed director of the institute, which he had originally endowed with the sum of £3700, and held the office till his death on the 1st of December 1841. The sphere of usefulness of the institution was gradually enlarged, and an endowment of £40,000 was carried out in 1883-1885. The college now holds day and evening classes in many of the sciences, in literature, languages and art.

BIRKENFELD, a town of Germany, capital of the principality of the same name, on the Zimmerbach, 25 m. S.E. of Trier and on the main line of railway from Bingerbrück to Neunkirchen. Pop. 2500. Close by, on an eminence, lie the ruins of the castle of Birkenfeld, dating from the 14th century, once the residence of the counts palatine of Zweibrücken. The town has an Evangelical and a Roman Catholic church, a grand-ducal high school and a hospital. Besides brewing and tanning, its industries include the manufacture of tobacco and chirocy. There is also a considerable trade in cattle.

The Principality of Birkenfeld is hilly and well-forested; agriculture prospects on the cleared lands, and fruit is grown in the valley of the Nahe, the principal stream. Ironstone and roofing slates are quarried, and there is some industry inagate-polishing and the manufacture of trinkets. The principality
BIRKENHEAD has an area of 312 sq. m. and a population (1900) of 43,400, chiefly Protestants. It is formed out of the former lordships of Dachstuhl and Oberstein, of part of the ancient countyship of Sponheim, and sections of the duchy of Jülich, which were granted to the grand-duke of Oldenburg by the congress of Vienna in 1815. It is entirely an enclave in Prussian territory, and though it is represented in the Oldenburg diet, it is governed by a separate Regierungskollegium, consisting of a president and two members, who are responsible to the Oldenburg ministry.

BIRKENHEAD, a municipal, county and parliamentary borough, and seaport of Cheshire, England, on the river Mersey, 193 m. N.W. of London. Pop. (1901) 110,015. It lies opposite Liverpool, on the east shore of the peninsula of Wirral, and is served by the Birkenhead (London & North-Western and Great Western Joint) and the Wirral railways. It is wholly of modern growth, although the name of Byrkhed is traced to the forest which is believed to have extended between the mouths of the Dee and the Ribble in Lancashire. A Benedictine monastery was founded (c. 1150) by Hamon de Masy, third baron of Dunham Massey, and dedicated to St Mary and St James. It drew its main revenues from tolls levied at the Mersey ferry; and its prior sat in the parliament of the earls of Chester, enjoying all the dignities and privileges of a Patalantine baron. A fine crypt, along with remains of the prior's lodging, refectory and chapel, may still be viewed, as the priory was purchased by private subscription and handed over to the municipality in 1896.

The rise of Birkenhead, from a hamlet of some 50 inhabitants in 1815 to its present importance, was due in the first place to the foresight and enterprise of William Laird, who purchased in 1824 a few acres of land on the banks of a marshy stream, known as Wallasey Pool, which flowed into the Mersey about 2 m. west of the village. Among other engineers, Telford and Stephenson favoured the project of converting Wallasey Pool into a great basin for shipping; but, largely owing to the fears of Laird and lest a formidable rival should thus be created, it was not until 1843 that parliamentary powers were obtained, and the work entrusted to James Rendel, who finished it in less than five years. The docks, which covered an area of 7 acres, were opened in 1847, and after thrice changing hands were made over in 1858 to the Mersey Docks and Harbour Board, a body created by act of 1857, to control the harbourage on both sides of the river.

Meanwhile, the town itself grew rapidly. In 1833 an act was passed for paving, watching, cleansing and improving the streets; as well as for the regulation of police, and the establishment of a market. The Improvement Commissioners constituted by this act included the mayor, bailiffs and four aldermen of Liverpool, under whose care the main streets were laid out on a regular plan, intersecting one another at right angles; and the first iron tramway in England was laid down. Electricity was subsequently applied to the tramway system. Noteworthy public buildings are St Alka's College, a large brick building in Tudor style, for the use of Anglican students in theology; the market hall (1843); town hall, a free library with branches, borough hospital, built at the cost of Sir John Laird; and many schools both public and private, including the industrial schools built as a memorial to Albert, prince consort, at the cost of Sir W. Jackson, and the school of art, given by Sir John Laird. There are many handsome modern churches, all built since 1821. Roman Catholics are especially numerous, owing to the presence of a large Irish population.

The town is well furnished with open spaces. Birkenhead Park was opened in 1847, Mersey Park in 1885; while a tract of moorland 6 m. distant in the township of Thurstaton, was allotted to the borough of Birkenhead in 1887; and Meols Common, comprising over 50 acres of pastureland on the shores of Liverpool Bay, was made over to the corporation in 1900.

The increase of railway accommodation has been swift. In 1878 the old Monks Ferry station on the Great Western system was superseded by the opening of the Woodside passenger station, and a few years later the Birkenhead town station was opened. In 1886 the Mersey tunnel, connecting Birkenhead with Liverpool, was opened by the prince of Wales. The system extends from Rock Ferry and Park stations on the Cheshire side to the low-level at Central Station in Liverpool, and has connections on the Cheshire side with the Great Western, North-Western, Wirral and various local lines. The Wrexham, Mold & Connah's Quay railway, which was taken over by the Great Central company in 1905, helped to bring the mineral wealth of Flint and North Wales generally into the Birkenhead docks.

Woodside Ferry may still be regarded as the principal entrance to Birkenhead and the Wirral from Liverpool. The exclusive right of ferryage was granted to the priory in 1332. In 1842 the Birkenhead Commissioners purchased it, under an act of parliament, from the lord of the manor, Mr F. R. Price. In 1897 the corporation further acquired the rights over the Rock Ferry and the New Ferry at the southern end of the town. Despite competition from the Mersey tunnel, these ferries continue to transport millions of passengers annually, and have a considerable share in the heavy goods traffic.

Though at the outset a mere commercial offshoot of Liverpool, Birkenhead has acquired a large export trade in coal and manufactured articles, importing guano, grain and cattle in return. Iron foundries, breweries, oil-cake and seed mills also exist side by side with such immense engineering and shipbuilding works as the Britannia Works, Canada Works, and, above all, Laird's shipbuilding works, where several early iron vessels were built, and many cruisers and battleships have been launched. Huge warehouses and sheds have been erected along the quays for the storage of freight. In 1847 the Birkenhead Dock Warehousing Company opened its first warehouse, capable of holding 80,000 tons of goods. A line called the Dock Extension railway was carried round the whole, and the company erected, for their workmen, the Dock Cottages. This entire property is now under the authority of the Mersey Docks and Harbour Board.

The pile of buildings known as the corn warehouses are traversed by a canal which gives access to its several departments, and are provided with mechanical grain-elevators. There are also extensive lairages for live-stock, and cold storage for dead meat. On the north and north-east, and partly on the east, Birkenhead is bounded by its docks, which extend, for a distance exceeding 2 m., from the landing-stage at Woodside Ferry to the Wallasey Bridge. Of these the principal are the Egerton, Morpeth, Morpeth Branch and Wallasey Docks; while the Alfred Dock, with its three entrances, nineteen pairs of lock-gates, 8 acres of water, and 460 l. yds. of quay-space, fulfils the part of an entrance-lock to the whole system. The great Float, now occupying the site of Wallasey Pool, separates Birkenhead from Poulton-cum-Seacombe in the parish of Wallasey. It forms an immense dock of 120 acres, with a quay-space of about 5 m.; and communicates on the E. with a low-water basin of about 14 acres and with the Alfred Dock; on the S.E. with the Morpeth, Morpeth Branch and Egerton Docks. The Morpeth Dock (about 11 acres, quay-space 1299 l. yds.) is in communication with the Monk's Ferry Dock (about 33 acres, quay-space 600 l. yds.); both being set apart for the use of steamers. The total water-space of these docks amounts to 165 acres, and the lineal quay-space is about 93 m. The entrances to the Birkenhead Docks are capable of docking the largest class of steamers afloat. The massive iron bridges across the dock entrances are opened and closed by hydraulic power, which is likewise applied to the cranes, coal-hoists, warehouse-lifts and other machinery about the docks. At the extreme western end of the West Float are three large graving docks, two about 750 ft. in length, and 130 and 80 ft. respectively in width; while the largest measures about 900 ft. in length and 130 ft. in width.

In 1861 Birkenhead was created a parliamentary borough, returning one member. In 1877 it received a municipal charter, the boundaries of the borough including the suburban townships of Tranmere, Claughton, Oxton and part of Higher Bebington. The borough is under a mayor, 14 aldermen and 42 councillors. Area, 3848 acres.
BIRMINGHAM, a city and the county-seat of Jefferson county, Alabama, U.S.A., in the north-central part of the state, 96 m. W. of Montgomery, at an altitude of 600 ft. It is served by the Southern, the Louisville & Nashville, the Seaboard Air Line, the Central of Georgia, the Alabama Great Southern (of the Queen & Crescent Route), the Illinois Central, the Atlantic, Birmingham & Atlantic, the Birmingham Southern (for traffic only), and the Kansas City, Memphis & Birmingham (Frisco system) railways. Pop. (1890) 26,178; (1900) 38,415, of whom 16,575 were of negro descent, and 17,766 were foreign-born; (1910) 132,685. Birmingham is situated in Jones Valley, between two mountains which lie south-east and north-west of the city. Its streets are wide and well constructed, and there are sixteen public parks, three of which, East Lake, Lakeview and Capitol, are particularly attractive. Among the principal buildings are the First National bank, the immense Union station and the Saint Vincent hospital; besides several fine office and school buildings (including the beautiful manual training high school) and churches. Although the state constitution restricts municipal investments, a Waring or "Separate" sewage system has been established. The most important educational institutions are the Birmingham medical college and college of pharmacy; the Birmingham dental college; a school of art and a conservatory of music. At East Lake station, in the north-east of the city, is Howard College (Baptist; founded at Marion, Perry county, in 1841 as an academy; granted first collegiate degrees in 1848; opened in East Lake in 1887); and 2 m. west of the city is the North Alabama Conference College (Methodist Episcopal South), opened in 1897.

Birmingham, situated in an immensely rich iron, coal and limestone region, is the principal manufacturing centre in the state, and the most important centre for the production and manufacture of iron in the southern states. In the decade 1890-1900 the value of the products of Birmingham's manufacturing establishments was increased 70% from $5,064,218 to about $8,681,066; in 1900 establishments under the "factory system" produced goods valued at $8,590,418, in 1905 at $7,592,958, a decrease of 11.7%.

Immediately outside the city limits in 1905 there were many large manufactories, including the repair shops of the Southern railroad; iron and steel, car wheels and cotton-oil were among the products of the suburban factories. In Jefferson county there were in 1900 more than 300 mining and manufacturing establishments, engaged, chiefly, in the production of iron, coal and coke, and a majority of these are in Birmingham and its suburban towns. A short distance south of the city is Red Mountain, 25 m. long and about 225 ft. high, rich in hematite iron ore; valuable limestone deposits are found some 30 m. distant, and in the vicinity are three great coalfields, the Warrior, the Coosa and the Cahaba. These natural advantages make possible the production of pig iron at an unusually low cost. In 1900 the Birmingham district produced six-sevenths of the total pig iron exported from the United States, and in 1902 nine-tenths of Alabama's coal, coke and pig iron; in 1905 Jefferson county produced 67.5% of the total iron and steel product of the state, and 62.5% of the pig iron produced by the state. The first steel plant in the southern states was established at Birmingham in 1897; in 1902, at Ensley, one of the suburbs, there were 10 furnaces controlled by one company. The city has also a large trade in cotton, the annual receipts averaging about 100,000 bales. Among the manufactures are cotton goods, cotton-seed oil, yarn, furniture and machinery. Birmingham also has important lumber interests.

The city is a product of the industrial transformation in the southern states since the Civil War. In 1870 the site was a cotton field, where two railways, the South & North and the Alabama Central, met. 2 m. from Elyton. In 1871 a land company, promoted by railway officials, founded Birmingham. Within four months the population was 1200; by 1873 it was 2500; in 1880 it was 3086; and in 1890 it had reached 26,178.

BIRMINGHAM, a city and a municipal, county, and parliamentary borough, the metropolis of one of the greatest industrial districts in England. Pop. (1901) 522,204. It lies in the north-west of Warwickshire, but its suburbs extend into Staffordshire on the north and west, and into Worcestershire on the south. It is 113 m. north-west from London by the London & North-Western railway, lying on the loop line between Rugby and Stafford; it is also served by the northern line of the Great Western, and by the north and west (Derby-Bristol) line of the Midland railway.

Site.—Birmingham, built upon the New Red Sandstone, is situated in the valleys of the Rea and other small feeders of the river Tame, near their sources, and upon the rising ground between these valleys. The site is, therefore, boldly undulating, varying from 200 to 600 ft. above sea-level, steadily rising towards the north and west, while the well-marked line of the Lickey hills skirts the site on the south-west, extending thence southward. From the high ground to the southeast Birmingham thus presents the appearance of a vast semicircular amphitheatre, the masses of houses broken by innumerable factory-chimneys; the whole scene conveying a remarkable impression of a community of untiring industrial activity. The area of the town is nearly 20 sq. m., the greatest length from north to south 7 m., and the greatest breadth about 4 m. Yet Birmingham is a fraction only of an industrial district, of which it forms the south-eastern extremity, which itself resembles one vast city, and embraces such famous manufacturing towns as Dudley, Wolverhampton, Walsall, Wednesbury and many others. This is the district commonly known as the "Black Country," which forms part of the South Staffordshire industrial district. Birmingham, however, does not lie actually within the "Black Country" properly so-called.

Streets and Buildings.—The plan of the town, as dictated by the site, is irregular; the streets are mostly winding, and often somewhat narrow. In the centre are several fine thoroughfares, containing nearly all the most important buildings. New Street, Corporation Street and Colmore Row are the chief of these. At the western end of New Street is a fine group of buildings, including the council house and art gallery, the town hall and post office. The council house and art gallery, begun in 1874 and completed in 1881, is in Renaissance style, and the material is Darley Dale, Spinkwell and Wrexham stone. The entrance is surmounted with a pediment filled with groups of excellent sculpture. The erection of that part which forms the art gallery was the work of the gas committee, to whom the council granted the site on condition that they would build such a gallery over their own office, the council having no powers at the time to raise the required funds. The art gallery contains a fine collection of modern paintings, including masterpieces of David Cox, Millais, Hunt, Henry Moore, Alberti Moore, Briton-Riviere and Burne-Jones. In the industrial hall are rich stores of Oriental metal work, Limoges enamel, English and foreign glass and Japanese ceramics. In the side galleries are various textiles, and Persian, Rhodian, Grès de Flandres and other pottery. There is a remarkable collection of Wedgwood. Notable also is the collection of arms, which is probably the most complete in existence. The purchase of pictures has been made from time to time by means of an art gallery purchase fund of £12,000, privately contributed and placed under the control of the corporation. Many valuable works of art are the gift of individuals. In 1906 plans were obtained for additional municipal offices and another art gallery on a site on the opposite side of Edmund Street from the council house. The town hall, completed in 1850, is severely classic, modelled upon a Greek temple. The lower stage consists of a plinth or basement, 23 ft. high, upon which is reared a façade of peripteral character, with eight Corinthian columns (36 ft. high) at the two principal fronts, and thirteen columns on each side. These columns (imitated from those of the temple of Jupiter Stator at Rome) support a bold and enriched cornice, finished at each end with a lofty pediment and entablature. The exterior of the hall is built of Anglesea marble. The interior consists chiefly of a regularly-built room,
designed specially for meetings and concerts, with an orchestra containing a fine organ. The hall seats upwards of 2,000 persons, but when cleared of benches, as is the case at great political meetings, over 5,000 may find standing room. The Midland Institute, adjacent to the town hall on the west, has a fine lecture theatre. To the south lie the post office, the inland revenue office and Queen's College. To the north is the Gothic building of Mason College, an institution merged in the university. The Central free library, adjoining the Midland Institute, was rebuilt in 1879, after a fire which destroyed the fine Shakespeare library, the Cervantes collection, and a large series of books on, and antiquities of, Warwickshire, known as the Staunton collection. The Shakespeare series was as far as possible replaced, and the whole forms one of the largest references and lending libraries in England. Edmund Street and Colmore Row are fine thoroughfares running parallel in a north-easterly direction from either side of the council house; in the first the principal building is the school of art, in the second are several noteworthy private buildings. Both terminate at Snow Hill station, that of the Great Western railway. New Street station, that of the London & North Western and Midland railways, lies close to the street of that name, fronted by the Queen's hotel. The station is nearly a quarter of a mile in length. The roof of the older portion consists of a vast arch of glass and iron, carried on pillars on each side, and measuring 1,500 ft. in length, 80 ft. in height, and 112 ft. in width in a single span. The building of the Royal Society of Artists fronts New Street itself with a fine classic portico; here are also the exchange (Gothic) and the grammar school of King Edward VI., a Perpendicular building dating from 1460, designed by Sir Charles Barry. Corporation Street was the outcome of a great "Improvement scheme" initiated in 1875, with the object of clearing away a mass of insanitary property from the centre of the town and of constructing a main thoroughfare from the centre to the north-eastern outlet, starting from New Street, near the railway, and thence continuing the Aston New Road. The scheme received parliamentary sanction in 1876, and was finished in 1882 at a cost of £1,520,047. This led to an almost total extinction of the residential quarter in the centre of the town. The finest building in this handsome street is the Victoria assize courts. The foundation stone was laid by Queen Victoria in 1887, after Birmingham had been created an assize district; the building was completed in 1891. There is a handsome entrance, and within is a great hall, 80 ft. by 40, with a series of stained-glass windows. The exterior is red, and highly ornamented in the style of the Renaissance.

Among other noteworthy buildings are the county court, education offices and military drill hall. Among a fine series of statues and monuments may be mentioned the statue of Nelson by Richard Westmacott, in the Bull Ring; those of Joseph Sturge, at the Five Ways, and of Thomas Attwood, the founder of the Political Union, in Stephenson Place, both by J. E. Thomas; James Watt, a similarly beautiful work, in Ratcliffe Place, by Alexander Munro; Sir Robert Peel, in New Street, by Peter Hollins; Albert, prince consort, in the council house, by J. H. Foley; and Queen Victoria, by Thomas Woolner; Sir Rowland Hill, in the hall of the post office, by Matthew Noble; and Dr Priestley, in New Street, by F. J. Williamson. There is also a fountain behind the town hall, commemorative of the mayorality of Mr Joseph Chamberlain, and flanked by statues of Sir Josiah Mason, and George Dawson, who took active part in the municipal reform movement previous to Mr Chamberlain's years of office. Sir Francis Chantrey's famous statue of James Watt is in a special chapel at Handsworth church.

Suburbs.—The principal streets radiating from central Birmingham to the suburbs are served by electric tramways worked by the corporation, and also by motor omnibuses. The principal suburban districts are as follows. Edgbaston and Harborne lie south-west of the centre of the city, being approached by Broad Street. These form a residential district principally inhabited by the richer classes, and owing to the enforcement of strict rules by the ground landlord, retain a remarkable semi-rural character, almost every house having a garden. Here, moreover, are Calthorpe Park, the botanical gardens, and the large private grounds attached to Edgbaston Hall, also the Warwickshire county cricket ground. To the south of Edgbaston, however, are the growing manufacturing districts of Selly Oak and Bourneville, and south of these, Northfield and King's Norton, in Worcestershire. The districts to the east of central Birmingham are Balsall Heath, Sparkbrook, Small Heath and Saltley. On the south-east is the residential suburb of Moseley, and on the east that of Yardley. Between Moseley and King's Heath to the south, is Highbury, the seat of Mr Joseph Chamberlain, whose active interest in the affairs of the town, both during his mayoralty (1873–1876) and at other times, was a principal factor in such works as the municipalization of the gas and water supply, the Corporation Street improvement, and the foundation of Birmingham University. On the east side the transition from town to country is clearly marked. This, however, is not the case on the west side, where the borough of Smethwick adjoins Birmingham, and the roads through West Bromwich and towards Oldbury and Dudley have the character of continuous streets. On this side are Soho and Handsworth, which gives name to a parliamentary division of Staffordshire. To the north lies Aston Manor, a municipal borough of itself, with Perry Barr beyond. To the north-east a populous district extends towards the town of Sutton Coldfield. Aston Hall is a fine Jacobean mansion standing in an extensive park. Aston Lower Grounds is an adjacent pleasure-ground. Besides these and the Edgbaston grounds the chief parks are Summersfield Park, towards Smethwick; Soho Park; Victoria Park, Handsworth; Adderley Park, towards Saltley; and Victoria Park, Small Heath. There is a race-course at Castle Bromwich, 3 m. east of the town.

Churches and Religion.—Birmingham is not rich in ecclesiastical architecture. It became a bishopric under the Bishops of Southwell and Birmingham Act 1904, including the archdeaconry of Birmingham and the rural deanery of Handsworth, previously in the diocese of Worcester. Before 1821 it was in the diocese of Lichfield. There were formerly a religious house, the priory of St Thomas the Apostle, and a Guild of the Holy Cross, an association partly religious and partly charitable, having a chantry in the parish church. The possessions of the priory went to the crown at the dissolution, and the building was destroyed before the close of the 16th century. The lands of the Guild of the Holy Cross were granted by Edward VI. to trustees for the support of the free grammar school. Until 1715 there was but one parish church, St Martin's, a rectory, having the tithes of the entire parish of Birmingham. St Martin's was erected about the middle of the 13th century, but in the course of ages was so disfigured, internally and externally, as to present no traces, except in the tower and spire, of its former character. In 1853 the tower was found to be in a dangerous condition, and in 1871 the spire was rebuilt. In 1873 the remaining part of the old church was removed without disturbing the monuments, and a larger edifice was erected in its place. St Philip's, a stately Italian structure, designed by Archer, a pupil of Wren, was the next church erected. It was consecrated in 1715, enlarged in 1884, and became the pro-cathedral on the foundation of the diocese. It contains a rich series of stained-glass windows by Burne-Jones. Then followed St Bartholomew's in 1749, St Mary's in 1774, St Paul's in 1770, St James's, Ashdt, in 1791, and others. St Alban's is a good example of J. L. Pearson's work, and Edgbaston church is a picturesque Perpendicular structure.

Under the Commonwealth Birmingham was a stronghold of Puritanism. Clarendon speaks of it and the neighbourhood as "the most eminently corrupted of any in England." Baxter, on the other hand, commending the garrison of Coventry, says it contained "the most religious men of the parts round about, especially from Birmingham." The traditional reputation for Nonconformity is maintained by the town, all varieties of dissenters being numerous and influential. The Unitarians, the
oldest body established here, have among their chapels a handsome structure in Bristol Road, the Old Meeting, which in 1885 replaced the building in which the congregation was formed on the Presbyterian model by a number of ministers ejected under the Act of Uniformity. Another chapel, the New Meeting, in Moor Street, is memorable as having been the place of Dr Joseph Priestley's ministerial labours from 1780 onwards. In 1862 the Unitarians removed from this place to a new Gothic edifice, called the church of the Messiah, in Broad Street, where they preserve a monument of Priestley, with a medallion portrait in profile, and an inscription written by Priestley's friend, Dr Parr. The first meeting-house of the Society of Friends dates from about 1690. Among Independent chapels, that of Carr's Lane had John Angell James and Robert William Dale as ministers. The Baptists first erected a chapel in Cannon Street in 1738. The Wesleyan Methodists were established in Birmingham by John Wesley himself in 1745, when he was roughly handled while preaching on Gosta Green. In 1769 a very fine chapel, with lofty tower, was opened by this body, in the style of the Renaissance, fronting upon Corporation, Ryder and Dalton streets. The Presbyterians have also places of worship, and the Jews have a synagogue. From the revolution of 1688 until 1780 the Roman Catholics had no place of worship here; but Birmingham is now a Roman Catholic bishopric. The cathedral of St Chad was built from the designs of A. W. Pugin. At Erdington, towards Sutton Coldfield, is a large Benedictine Abbey (1897) of the Beuron congregation, founded as a monastery in 1876; and in the vicinity, at Oscott, is St Mary's College, where the chapel is a fine example of Pugin's work. Cardinal Newman was superior of the Oratory of St Philip Neri from its foundation in 1831.

Administration.—The government of the town resided originally in the high and low bailiffs, both officers chosen at the court of the lord of the manor, and acting as his deputies. The system was thus loose and easy, but by degrees it became somewhat organized, and council writs were addressed to the bailiffs. In 1382, when the town was enfranchised, they were made the returning officers. About the beginning of the 19th century, however, a more regular system was instituted, by an act creating a body of street commissioners, who acted for the parish of Birmingham, the hamlets outside its boundaries having similar boards of their own. The annoyance and difficulty caused by these bodies, thirteen in number, led to a demand for the incorporation of Birmingham as a borough; and a charter was accordingly granted by the crown in 1838, vesting the general government in a mayor, sixteen aldermen and forty-seven councillors. The powers of this body were, however, unusually restricted, the other local governing bodies remaining in existence. It was not until 1852 that an act of parliament was obtained, abolishing all governing authorities excepting the town council, and transferring all powers to this body. Another local act was obtained in 1862, and in 1883 these various acts were combined into the Birmingham Corporation Consolidation Act. In 1889 Birmingham was created a city, and a grant made of an official coat of arms carrying supporters. The title of lord mayor was conferred on the chief magistrate in 1897. The city council consists of eighteen aldermen and fifty-four councillors, selected from eighteen wards; it is divided into seventeen committees, most of which consist of eight members. The corporation is the largest employer of labour in the borough, and is also a large landowner.

The gas, electric and water supplies are in its hands. The gas supply was taken over in 1875, and the electric in 1900 for £240,000. The local sources of water-supply are the rivers Bourne and Blythe, the Plant Brook and the Perry Stream, and eight deep wells. These works can provide 20 million gallons daily in dry weather. A large area outside the city boundaries is supplied, and in 1891, the demand having risen to nearly 17 million a day, new sources had to be considered, and it was determined to seek an entirely new supply in Wales. By an act of 1892 power was given to acquire the watershed of the rivers Elan and Claerwen, tributaries of the Wye, lying west of Rhayder in Wales, and to construct the necessary works, the capital authorized being £6,000,000. About £5,900,000 had been spent when, on the 21st of July 1904, King Edward VII. formally opened the supply. Two reservoirs on the river Elan, formed by masonry dams from 98 to 128 ft. above the river-bed, were then completed, the construction of the three planned on the Claerwen being deferred until necessity should arise. Nearly a mile below the confluenve of the rivers the great Caban Coch dam, 122 ft. high, and the same in thickness at the base, and 600 ft. long at the top, holds up the water for over 4 m. in the Elan, and over 2 in the Claerwen, having a capacity of 1500 million gallons. A series of thirty filter beds is included in the original scheme; and the water travels 73.3 m. from the source to Birmingham by gravity alone with a fall of about 170 ft. The area of the gathering ground is 45,592 acres, the mean annual rainfall in the district being 63 in. The complete scheme provided water for fifty years in advance, and a maximum of 75 million gallons a day was taken into account, in addition to 27 million gallons for compensation works. to the rivers. The petro-works opened in 1904 provided about 27 million gallons of supply daily to the city. The corporation is obliged by the act to supply towns within 15 m. of the line of the aqueduct. A village for the accommodation of workmen was established near the Caban Coch dam; and the corporation adopted a modified form of the Gothenburg system in respect of the supply of intoxicating liquors, permitting no publican to open a licensed house.

The administration of the poor-law is vested in a board of guardians of sixty members for the parish of Birmingham. The parish of Edgbaston (wholly within the borough) is in the poor-law union of King's Norton, and that part of the parish of Aston included in the borough is in the Aston Union. There are three workhouses—that for Birmingham parish, situated at Birmingham Heath, is capable of receiving 2000 inmates. In 1873 a superintendent relief officer was appointed, and a system of cross-visitation started for the purpose of checking abuses of outdoor relief. Workhouses, infirmaries and cottage homes are managed by the board, on which women first sat in 1880. The administration of justice was performed from 1838 to 1838 by a court of quarter sessions, with a recorder, and a court of petty sessions. In 1884 Birmingham was made an assize district of Warwickshire. In 1905 a special juvenile offenders' court was initiated. The borough gaol is at Winson Green towards Smethwick. The drainage system is managed by the Birmingham, Tame and Rea District drainage board, constituted in 1877, and consisting of members from the city council and from districts outside the municipal area.

Birmingham was enfranchised in 1832, when two representatives were assigned to it, and Thomas Attwood and Joshua Scholefield, leaders of the Political Union, were elected. In 1867 three members were assigned, and in 1885 the number was increased to seven, and a corresponding number of parliamentary divisions created, namely Bordesley, Central, East, Edgbaston, North, South and West. By the Provincial Local Government Board Act of 1891 four local board districts were added to the city of Birmingham for local government—Harborne (Staffordshire), Balsall Heath (Worcestershire), Saltley and the rural hamlet of Little Bromwich (Warwickshire). These districts were by the act declared to be in the county of Warwick, though still remaining in their respective counties for the exercise of freehold votes. By this act the boundaries of the city were made conterminous for parliamentary, municipal and school board purposes. The area is 12,639 acres.

The population of Birmingham in 1791 was about 15,000. In 1801 it was 73,000, and it increased rapidly through the century. In 1891 it was 478,113 and in 1901, 522,704.

Education.—The oldest educational institution is the grammar school of King Edward VI., founded in 1552 out of the lands of the Gild of the Holy Cross, then of the annual value of £21. The endowments now yield upwards of £47,000. The principal school included in the foundation is the boys' high school, held in the building in New street. It has a classical and a modern side, and educates about 500 boys. Another building opened in 1869, is a large high school for girls, with 300
pupils. There are also on the foundation seven middle schools, called grammar schools, four for girls and three for boys, situated in different parts of the city, and containing about 1000 pupils altogether. The schools have numerous scholarships tenable at the schools as well as exhibitions to the universities and other places of higher education. Queen's College, founded in 1828 as a school of medicine, subsequently embraced other subjects, though in 1882 only the medical and theological departments were maintained. In 1882 a large part of the scientific teaching, hitherto done by special professors in Queen's College, was taken over by Mason College, and in 1892 the whole medical department was removed to the same institution under an order from the court of chancery. This change helped to advance the Birmingham medical school to a position of high repute. The theological students (Church of England) of Queen's College are few. The idea of developing Queen's College into a university had long existed. But it was destined to be realized in connexion with Mason College, founded by Sir Josiah Mason in 1870. Subsequent deeds (1874 and 1881) added Greek and Latin to the practical, mechanical and artistic curriculum of the original foundation, and provided that instruction may be given in all such other subjects as the trustees may from time to time judge necessary, while in every fifteen years the provisions of the deed may be altered or revised by the original donors or their representatives. **Birmingham**

The Central Free Library, in a modern building, the Central free library, and the Central free library, in different parts of the city, each with a lending department and a reading room.

**Charities.** — The general hospital, the foundation of Dr Ash, an eminent local physician, was opened in 1779. The old building was replaced in 1897 by a splendid new one in St Mary's Square, costing £206,000. The Queen's hospital, Bath Row, the old large hospital of the town, was founded in 1840 by W. Sands Cox, F.R.S., an eminent local surgeon, who also founded the Queen's College as a medical school. The general dispensary, the officers of which visit patients at their own homes, relieves about 800 yearly. The children's hospital (free) established in 1864 by Dr Heaslop, has two establishments—for outpatients (a handsome Gothic building) in Steelhouse Lane, and an in-patient department in Broad Street. There is also a women's hospital (free) for the special diseases of women; a lying-in charity; special hospitals for diseases of the eye, the ear, bodily deformities, and the teeth; and a homœopathic hospital. The parish of Birmingham maintains a large infirmary at Woodcourt (in Birmingham Road), and a dispensary for out-patients in Paradise Street. These medical schools and dispensaries are free. Nearly all these medical charities depend upon subscriptions, donations, legacies and income from invested property. There are two public organizations for aiding the charities, both of which were begun in Birmingham. One is a simultaneous collection in October in churches and chapels, on the Sunday called Hospital Sunday, established in 1859; the other is the Saturday Hospital collection, made by the work-people in March, which was established in 1873. A musical festival is held triennially in aid of the general hospital. There is a sanatorium at Blackwell, near the Lickey Hill, 10 m. south of Birmingham, common to all the hospitals. Amongst the non-medical charities the principal are the blind institution and the deaf and dumb asylum, both at Edgbaston; and Sir Josiah Mason's orphanage at Erdington. There are also in the town numerous almshouses for aged persons, the chief of which are Lench's Trust, the James Charities, and the Licensed Victuallers' asylum. Besides, the general benefit societies, such as the Oddfellows', Foresters', &c., which are strongly supported in Birmingham, there have been numerous clubs of a charitable kind, and there are several important local provident societies of a general character, with many thousand members.

**Commerce.** — From an early period Birmingham has been a seat of manufactures in metal. Hutton, the historian of the town, claims for it Saxem or even British antiquity in this respect, but without foundation. The first direct mention of Birmingham trades is to be found in Leland's *Itinerary* (1548). He writes:—  

"I came through a pretty street as ever I entered into Birmingham towne. This street, as I remember, is called Dirtey [Deritend]. In it dwell smiths and cutlers. There be many smiths in the towne that use to make knives and all manner of cutley tools, and many lorimers that make bittes, and a great many naylors, so that a great part of the towne is maintained by smithes, who have their iron and seacoole out of Staffordshire."  

The cutlers no longer exist, this trade having gone to Sheffield; but the smiths remain, and the heavier cutting tools are still largely made here. The wide importance of Birmingham as a centre of manufactures began towards the close of the 17th century, one great source of it being the absolute freedom enjoyed by the town, there being no numerous clubs of the most of any kind; besides which the easy access to cheap coal and iron indirectly helped the development. It is remarkable that two important trades, now located elsewhere, were first established here. Steel was made in Birmingham until 1707, but then ceased to be so for about seventy years, when an experiment in steel-making was made by a single firm. Cotton-spinning was begun in Birmingham by John Wyatt, Lewis Paul and Thomas Warren as early as 1730; but the speculation was
abandoned before the end of the century. The great staple of Birmingham is metal-working in all its various forms. The chief variety is the brass-working trade. Iron-working, though largely carried on, is a much less important trade, works of this kind being chiefly established in the Staffordshire district. Jewelry, gold, silver and gilt come next to brass. The remarkable development of this branch of industry is demonstrated by the increase in the amount of gold and silver marked, as recorded by the Assay office—the figures of 48,123 oz. of gold and 84,323 oz. of silver in 1870 had been increased to 365,000 oz. of gold and nearly 3,000,000 oz. of silver by the end of the century. Then follow “small arms” of all kinds. Until 1806 a Royal Small Arms factory was maintained by the government at Sparkbrook, but it was then transferred to the Birmingham Small Arms Company, which had already extensive works in the district. Buttons, hooks and eyes, pins and other articles used for dress, constitute a large class of manufactures. Glass, especially table glass, is a renowned staple of the town. Screws, nails, &c., are made in enormous quantities; indeed, Birmingham has a monopoly of the English screw trade. Steel pens are also a specialty, the name best known in this connexion being that of Sir Joseph Mason. Electro-plating, first established in 1841 by the firm of Ridgway & Knighton, and now the best in the world. Among other branches of manufacture are wire-drawing, bell founding, metal rolling, railway-carriage building (a large and important industry), the manufacture of cutting implements and tools of all kinds, die-sinking, paper-maché making and a variety of others.

In 1897 there was a sudden development of cycle manufacturing, followed in 1899 by an almost equally sudden collapse, but this industry is maintained and accompanied by the manufacture of motor cars, tyres and accessories, for which Birmingham is one of the principal centres in Great Britain.

Birmingham may claim as her own the perfection of the steam engine, through the genius of James Watt and the courage of Matthew Boulton. The memory of the great Soho factory is one of the most precious heritages of the town, and Watt’s own private workshop continues just as he left it, with no single article disturbed, carefully preserved in the garret of his house at Heathfield. The mention of Watt and of Soho recalls the memories of distinguished inventors and others who have been connected with Birmingham. Here John Baskerville, the printer, carried on his work. An institution called the Lunar Society, which met each month about the time of full moon, brought together a brilliant company—Watt, Boulton, Joseph Priestley, Josiah Wedgewood, Erasmus Darwin, Samuel Parr, Dr William Withering, Richard Lovell Edgeworth, Sir Joseph Banks, Sir William Herschel, Dr Solander, John Roebuck, James Keir and many others. William Murdock, the inventor of gas, was a Soho man, and first used his invention to light the Soho factory at the peace of Amiens in 1802. The series of inventors is continued by the names of Gyllott, Elkington, Chance, Mason and others. Thomas Rickman, the reviver and historian of Gothic architecture, practiced as an architect in Birmingham. William Hutton, the antiquary and historian, carried on his bookselling business here. Many of the best engravers were Birmingham men, notably James Tubbitts Willmore and John Pye, the special translator of the “Small Business” of the world. At Holroyd, Joseph Parkes, John Bright and Joseph Chamberlain spoke for Birmingham in the region of politics and statesmanship.

One of the most marked features of social life in Birmingham is the fact that contrasts in the distribution of wealth are less strongly marked than in most other great cities. The distance between the poorest and the richest is bridged over by a larger number of intermediate gradations. Colossal fortunes are few; on the other hand there is a numerous class of rich men. These, however, for the greater part are actually engaged in trade or manufactures, and hold their place in local life rather than account of industry pursued than of wealth possessed. The number of the lesured class, enjoying large incomes without participating in any local industry, is relatively small, but is said to be on the increase. There are many manufacturing companies, but great private firms are also numerous. In regard to labour conditions, the system of small masters holds its own in the manufactures of Birmingham, and shows no signs of extinction. One effect of this condition is that capital and labour are not brought into enmity, and consequently strikes and disputes are infrequent. As regards the condition of the working classes it may be noted that Birmingham was the birthplace of the freehold land and building societies, by which workmen are enabled on easy terms to acquire houses of their own. The risk of an overcrowded population is consequently minimized; the houses, moreover, are generally well situated as regards light and air, and many have small gardens. Among industrial communities where peculiar attention is paid to the housing of workmen and their families, that of Bourneville, occupied by the employed of Messrs Cadbury, chocolate manufacturers, is well known.

History.—Owing to its rapid expansion, and the consequent newness of most of the public and other buildings, Birmingham is often supposed to be a modern town. It was, however, in existence as a community in the Saxon period. Proof of this was given in 1306 by William de Bermingham, then lord of the manor, who showed in a law-suit that his ancestors had a market in the place and levied tolls before the Conquest. Some authors have endeavoured to identify the town with the supposed Roman station of Urbium, but there is no positive proof. Bermingham has been abandoned as fabulous. A Roman road runs north and south across the site of the town, but no remains have been found other than a few very coins. The origin of the name is untraceable; the spelling itself has passed through about 100 different forms. Dugdale, the historian of Warwickshire, adopts Bromwycham, and regards it as of Saxon derivation. Hutton, the historian of Birmingham, has the fanciful etymology of Brom (broom), weych (a descent), and ham (a home), making together the home on the hill by the heath.

In Domesday Book Birmingham is rated at four miles of land with half a mile of woods, the whole valued at £203. Two hundred years later the family of de Bermingham, the owners of the place, come into sight, one of them, William, being killed at the battle of Evesham, in 1265, fighting with Simon de Montfort and the barons against Henry III. The son of this William afterwards took part in the French war, and was made prisoner; his father’s estates, forfeited by treason, were restored to him. Thenceforward the family engaged in various local and other offices, but seemingly abstained from politics. They held the place until 1527, when Edward de Bermingham was deprived of his property by means of John Dudley, duke of Northumberland, who trumped up a pretended charge of riot and robbery against him and procured Birmingham for himself. On the attainder of Dudley the manor passed to the crown, and was granted to Thomas Marrow, of Birkswell, from whom by marriage and descent it went to Christopher Musgrave, and finally, as regards the only valuable part—the market tolls—by purchase to the town itself. In the Wars of the Roses it does not seem that Birmingham took any part; but energy revived in the Civil War under Charles I., when the town sided actively with the Parliamentarians. In 1642, when Charles was marching from Shrewsbury to relieve Banbury, the Birmingham people seized part of his baggage, including much plate, money and wine, which was sent to the Parliamentary garrison at Warwick. Before the battle of Edgehill Charles raised a force at Aston Hall, near the town, as the guest of Sir Thomas Holte. The Birmingham people resented this by helping the Parliamentarians to cannonade the Hall and to levy a fine upon Sir Thomas Holte. They also supplied the Parliamentary army with 15,000 sword blades, refusing to make a single blade for the Royalists. These manifestations of hostility were avenged in April 1643 by Prince Rupert, who, with 2000 men and several pieces of artillery, attacked the town, planting his cannon on an eminence near Sparkbrook, still known as Camphill. The townspeople resisted, but were beaten, many persons being killed or wounded. Amongst the former was Lord Denbigh, one of the Royalist officers. Having captured the place, Prince Rupert allowed his troops to plunder it, to burn about eighty houses and to set their prisoners to ransom. He also levied a fine of £5,000,
equal to at least £100,000 of the present value of money. This bitter lesson kept Birmingham quiet during the rest of the Civil War, though the sympathies of the people with the Parliamentarians were unabated. In 1665 Birmingham suffered heavy losses by the plague, great numbers of dead being buried in the Pest Field, at Ladywood, then a lonely place far outside the town, but long since thickly covered with buildings. In 1688 the Revolution provoked a temporary outbreak of Protestant feeling. James II. had given timber from the royal forest of Needwood, near Burton, to build a Roman Catholic chapel and convent in a place still called Mass-house Lane. This edifice the mob promptly destroyed and the house was left to William and Mary. Rather more than a century of quiet prosperity ensued, and then occurred the serious and most lamentable outbreak of popular fury known as the Church and King riots of 1791. For some years there had been much political activity in Birmingham, the dissenters, particularly the Unitarians, being desirous of relief from the political and religious disabilities under which they laboured. The leader in these movements was the famous Dr Priestley, who kept up an active controversy with the local clergy and others, and thus drew upon himself and his co-religionists the hatred of the more violent members of the Church and Tory party. The smouldering fire broke out on the occasion of the French Revolution. On the 14th of July a dinner of Birmingham Liberals was held at the Royal hotel to celebrate the destruction of the Bastille. This was the signal of a popular outbreak. A Church and King mob, encouraged and organized by leaders of better station, who were too cowardly to show themselves, began an attack upon the Unitarians. Priestley was not present at the dinner, but his house at Fair Hill, Sparkbrook, was one of the first to be sacked and burnt—his library and laboratory, with all his manuscripts, the records of life-long scientific and philosophical inquiries, perishing in the flames. The house and library of Hutton the historian were also destroyed. The Unitarian chapel was burnt, and several houses belonging to members of the sect were sacked and burnt. The riot continued until a strong body of troops was marched into the town, but before their arrival damage to the amount of more than £60,000 had been done. Some of the rioters perished in the burning buildings, in the cellars of which they drank themselves into stupification. Others were tried and imprisoned, and four of the prisoners were hanged. The persecuted Unitarians recovered a small part of their losses from the county; but Priestley himself, owing in a great measure to the unworthy prejudice against him, was forced to remove to the United States of America, where he spent the rest of his life. A late atonement was made by the town to his memory in 1873, by the erection of a statue in his honour in front of the town hall and the foundation of a Priestley scholarship at the Midland Institute. As if ashamed of the excesses of 1791, Birmingham thenceforth became, with one or two exceptions, a peaceful town. In the dismal period from 1817 to 1819, when the manufacturing districts were heavily distressed and were disturbed by riots, Birmingham remained quiet. Even when some of the workmen were tried and punished for demanding parliamentary representation, and for electing Sir Charles Woodley as their delegate, there was no demonstration of violence—the wise counsels of the leaders inducing orderly submission to the law. The same prudent course was observed when in the Reform agitation of 1831–1832 the Political Union was formed, under the leadership of Thomas Attwood, to promote the passing of the Reform Bill. Almost the whole town, and great part of the surrounding district, joined in this agitation; vast meetings were held on Newhall Hill; there was much talk of marching upon London 100,000 strong; but, owing to the firmness and statesmanship of Attwood and his associates, there was no rioting or any sign of violence. Ultimately the Political Union succeeded in its object, and Birmingham helped to secure for the nation the enfranchisement of the middle classes and other political reforms. One exception to the tranquillity of the town has to be recorded—the occurrence of riots in 1839, during the Chartist agitation. Chartism took a strong hold in Birmingham, and, under the influence of Feargus O'Connor and some of his associates, nightly meetings of a threatening character were held in the Bull Ring. The magistrates resolved to put these down, and having obtained the help of a detachment of the metropolitan police—the town then having no local police force—a meeting was dispersed, and a riot ensued, which resulted in injury to several persons and required military force to suppress it. This happened on the 4th of July. On the 15th of the same month another meeting took place, and the mob, strongly armed and numbering many thousands, set fire to several houses in the Bull Ring, some of which were burned to the ground and others were greatly damaged. The military again interfered, and order was restored, several of the ringleaders being afterwards tried and imprisoned for their share in the disturbance. There was another riot in 1867, caused by the fierce attacks of a lecturer named Murphy upon the Roman Catholics, which led to the sacking of a street chiefly inhabited by Irishmen; but the incident was comparatively trivial and further disorders were prevented by the prompt action of the authorities.

See W. Hutton, History of Birmingham (2nd ed., Birm., 1783); J. A. Langford, A Century of Birmingham Life, 1741–1841 (Birm., 1868), and Modern Birmingham and its Institutions, 1841–1891 (Birm., 1892); J. T. Bunce, History of the Corporation of Birmingham (Birm., 1855).

**BIRNEY, JAMES GILLESPIE** (1792–1857), American reformer, leader of the conservative abolitionists in the United States from about 1835 to 1845, was born in Danville, Kentucky, of a family of wealth and influence, on the 4th of February 1792. He graduated at the College of New Jersey (now Princeton University) in 1810. In 1814, after a course of legal study, he began the practice of the law at Danville. He entered immediately, as a Democrat, into Kentucky politics, and political ambition caused his removal in 1818 to northern Alabama, near Huntsville. There was at that time in the south-west much anti-slavery sentiment. Birney's father was among those who advocated a "free state" constitution for Kentucky, and the home environment of the boy had thus fostered a questioning attitude towards slavery, though later he was himself a slave-holder. In the general assembly of Kentucky in 1816, and in that of Alabama in 1819, he opposed inter-state rendition of fugitive slaves and championed liberal slave-laws. His career as a lawyer in Alabama was exceptionally brilliant; but his political career was abruptly wrecked by his opposition in 1819 to Andrew Jackson, whose friends controlled the state. His tariff and anti-slavery views, moreover, carried him more and more away from the Democratic party and toward the Whigs.

About 1826 he began to show an active interest in the American Colonization Society, and in 1832–1833 served as its agent in the south-west. In 1833 he returned to Danville, and devoted himself wholly to the anti-slavery cause. He freed his own slaves in 1834. Convinced that gradual emancipation would merely stimulate the inter-state slave trade, and that the dangers of a mixed labour system were greater than those of emancipation in mass, he formally repudiated colonization in 1834; moreover, gradualism had become for him an unjustifiable compromise in a movement toward which he had already abandoned the Whig party. He delivered anti-slavery addresses in the North, accepted the vice-presidency of the American Anti-Slavery Society and announced his intention to establish an anti-slavery journal at Danville (1835). For this he was ostracized from Kentucky society; his anti-slavery journals were withheld in the mails; he could not secure a public hall or a printer. In these circumstances, he removed to Cincinnati, Ohio, and there, in January 1836, founded the *Philanthropist*, which, in spite of rancorous opposition, became of great influence in the north-west. Birney soon relinquished its active control in order to serve the Anti-Slavery Society as secretary and as a lecturer. He favoured immediatism, but he differed sharply from the Garrisonian abolitionists, who abhorred the federal Constitution and favoured secession. He always wrote, spoke and laboured for the permanent safety of the Union. The assaults of the South in defence of slavery upon free speech, free press, the right of petition and trial by jury, he pronounced
"exorbitant claims . . . on the liberties of the free states"; the contest had become, he said, "one not alone of freedom for the blacks, but of freedom for the whites." Twenty-three years before, William H. Seward characterized as an "irresistible conflict" the antagonism between freedom and slavery. Birney proclaimed: "There will be no cessation of conflict until slavery shall be exterminated or liberty destroyed."—"liberty and slavery cannot both live in juxtaposition" (1835). The ends being political, so also, thought Birney, must be the means; as parties in the south were fusing, he laboured to re-align parties in the north, and advocated the formation of an independent anti-slavery party. After the separation of the Garrisonian and the political abolitionists in 1840 the new party was formed, and in 1840, and again in 1844, as the Liberty party (q.v.), it made Birney its candidate for the presidency. In 1840 he received 7060 votes; in 1844, 62,663. A fall from his horse in 1845 made him a hopeless invalid, and completely removed him from public life. He died at Perth Amboy, New Jersey, on the 25th of November 1857.

Two of Birney's sons, William Birney (1819-1907) and David Bell Birney (1825-1864), were prominent as officers on the Federal side during the Civil War in America.

Biron, Armand de Gontaut, Baron de (1524-1592), a celebrated French soldier of the 16th century. His family, one of the numerous branches of the house of Gontaut, took its title from the territory of Biron in Périgord, where on a hill between the Dropt and the Lide still stands the magnificent castle begun by the lords of Biron in the 11th century. As a page of the queen of Navarre Biron attracted the notice of the marshal de Brissac, with whom he saw active service in Italy. A wound received by him in his early years made him lame for life, but he did not withdraw from the military career, and he held a command in Guise's regiment of light horse in 1557. A little later he became chief of a cavalry regiment, and in the wars of religion he repeatedly distinguished himself.

His great services to the royal cause at Dreux, St Denis, Jarnac and Moncontour were rewarded in 1569 by his appointment as a privy councillor of the king and grand master of artillery. He commanded the royal forces at the siege of La Rochelle in 1572, and four years later was made a marshal of France. From 1576 to 1588 he was almost continuously employed in high command. From 1589 he supported the cause of Henry of Navarre, but was suspected of prolonging the civil wars in his own interest. Biron was killed by a cannon-ball at the siege of Epernay on the 26th of July 1592. He was a man of considerable literary attainments, and used to carry a pocket-book, in which he noted everything that appeared remarkable. Some of his letters are preserved in the Bibliothèque Nationale and in the British Museum; these include a treatise on the art of war.

Biron, Armand de Gontaut, duc de Biron (1562-1602), fought brilliantly for the royal party against the League. He was made admiral of France in 1592, and marshal in 1594; governor of Burgundy in 1595, he took the towns of Beaune, Autun, Auxonne and Dijon, and distinguished himself at the battle of Fontaine-Française. In 1596 he was sent to fight the Spaniards in Flanders, Picardy and Artois. After the peace of Vervins he discharged a mission at Brussels (1598). From that time he was engaged in intrigues with Spain and Savoy, and, notwithstanding, directed the expedition sent against the duke of Savoy (1599-1600). After fulfilling diplomatic missions for Henry IV. in England and Switzerland (1600), he was accused and convicted of high treason and was beheaded in the Bastille on the 31st of July 1602.

His collateral descendant, Armand Louis de Gontaut, duc de Lauzan, afterwards duc de Biron (1747-1793), is known for the part he played in the War of American Independence and the revolutionary wars. Until 1788, when he succeeded to the duchy of Biron on the death of his uncle,—Louis Antoine de Gontaut, duc de Biron (1700-1788)—he bore the title of duc de Lauzan, which had passed, on the death of Antoine Nompas de Caumont, duc de Lauzan (1633-1723), to his niece, the wife of Charles Armand de Gontaut, duc de Biron (1663-1756). After for a while wasting his fortune in dissipation in various parts of Europe, he attracted attention by an essay on the military defences of Great Britain and her colonies (État de défense d'Angleterre et de toutes ses possessions dans les quatre parties du monde). This led to his appointment to a command against the English in 1779, in which he gained several successes. In the following year he took a conspicuous part in the War of American Independence, and on his return to France was made maréchal de camp. In 1789 he was returned as deputy to the states-general by the noblesse of Quercy, and attached himself to the revolutionary cause. In 1791 he was sent by the Constituent Assembly to receive the oath of the army of Flanders, and subsequently was appointed to its command. In July 1792 he was nominated commander of the army of the Rhine, with the duty of watching the movements of the Austrians. In May 1793 he was transferred to the command of the army of La Rochelle, operating against the insurgents of La Vendée. He gained several successes, among them the capture of Saumur and the victory of Parthenay; but the insubordination of his troops and the intrigues of revolutionary agents made his position intolerable and he sent in his resignation. He was thereupon accused by the notorious Carrier of incivisme and undue leniency to the insurgents, deprived of his command (July), imprisoned in the Abbaye and condemned to death by the Revolutionary Tribunal. He was guillotined on the 31st of December 1793. Some Mémoires, which come down to 1783, were published under his name in 1822 (new ed. 1858), and in 1865 letters said to have been written by him in 1786 to friends in the country, describing the states-general.

BIRR, or Parsonstown, a market-town of King's county, Ireland, on an activity rising above the Birr, and on a branch of the Great Southern & Western railway by which it is 87 m. W.S.W. from Dublin. Pop. of urban district (1901) 4438. Phonetic spelling is in general, Birr. In the town there is a Doric column surrounded by a statue of the duke of Cumberland, to commemorate the battle of Culloden, is the point from which the several principal streets diverge in regular form. The fine castle of Birr, beside its historical interest, has gained celebrity on account of the reflecting telescope erected here (1828-1845) by William, third earl of Rosse. This is 56 ft. in length and weights 3 tons; and there is another smaller instrument. Among institutions the model and preparatory schools of the Brothers of the Presentation Order are noteworthy. There is a bronze statue by Foley of Lord Rosse (d. 1867). Some trade is carried on in corn and timber, and in brewing and distilling.

An abbey was founded at Birr by St Brendan (d. 573), to whom the present parish church is dedicated. The district formed part of Ely O'Carroll, and was not included in King's county till the time of James I. A great battle is said to have been fought near Birr in the 3rd century between Cormac, son of Cond of the Hundred Battles, and the people of Munster. The castle was the chief seat of the O'Carrols. In the reign of James I. it and its appendages were assigned to Lawrence Parsons, brother of Sir William Parsons, surveyor-general. From him the alternative name of the town is derived. The castle was more than once besieged in the time of Cromwell, and was taken by Ireton in 1650. It also suffered assault in 1688 and 1690.

Birrell, Augustine (1850— ), English author and politician, son of a Nonconformist minister, was born near Liverpool on the 10th of January 1850. He was educated at Amersham Hall school and at Trinity Hall, Cambridge. He went to the bar, and gradually obtained a good practice; in 1893 he became a K.C., and he was professor of law at University College from 1866 to 1899. But it was as a literary critic of unusually clever style and an original vein of wit, that he first became known to the public, with his volume of essays entitled Obiter Dicta (1884). In 1889 he was returned to parliament for West Fife as a Liberal. In the House of Commons his light
but pointed humour gradually led to the coinage of a new word, *birrellig,"* and his literary and oratorical reputation grew apace. Whether he was writing miscellaneous essays or law-books, his characteristic style prevailed, and his books on copyright and on trusts were novelties indeed among legal textbooks, no less sparkling than his literary *Oletra Dicta.* A second series of the latter appeared in 1857, *Res Judicatae* in 1859 and various other volumes followed, for he was in request among publishers and editors, and his easy charm of style and acute grasp of interesting detail gave him a front place among contemporary men of letters. Mr Birrell was first married in 1878, but his wife died next year, and in 1888 he married Mrs Lionel Tennyson, daughter of the poet Frederick Locker (Locker-Lampson). At the general election of 1900 he preferred to contest the N.E. division of Manchester rather than retain his seat in Fifeeshire, but was defeated.

He did valuable service, however, to his party by presiding over the Liberal Publication Department, and at the general election of 1906 he was returned for a division of Bristol. He had been included in Sir Henry Campbell-Bannerman’s cabinet, and as minister for education he was responsible for the education bill which was the chief government measure in their first session. But the prolonged controversy over the bill, and its appeal to the common opinion of the government to accept modifications made by the House of Commons, defeated him, but with the denominational interest, made his retention of that office impossible, and he was transferred (January 1907) to the post of chief secretary for Ireland, which he subsequently retained when Mr Asquith became prime minister in 1908. In the session of 1907 he introduced an Irish Councils bill, a sort of half-way house to Home Rule; but it was unexpectedly repudiated by a Nationalist convention in Dublin and the bill was promptly withdrawn. His prestige as a minster, already injured by these two blows, suffered further during the autumn and winter from the cattle-driving agitation in Ireland, which he at first feebly criticized and finally strongly denounced, but which his refusal to utilize the Crimes Act made him powerless to stop by the processes of the “ordinary law”; and the scandal arising out of the theft of the Dublin crown jewels in the autumn of 1907 was a further blow on the Irish administration.

On the other hand his scheme for a reconstituted Irish Roman Catholic university was very favourably received, and its acceptance in 1908 did much to restore his reputation for statesmanship.

**BIRTH**

in various languages to Teutonic languages from the root of the verb “to bear,” the act of bringing forth a child, or the fact of its being born; so also a synonym for descent or lineage. In law, a child not actually born, but *en voiture sa mère,* is supposed for many purposes to be actually born, and may take any benefit to which it would have been entitled if actually born, *i.e.* it may take as legatee or devisee, or even as next-of-kin or heir, but none of these conditions will take effect, unless the child is born alive (see MEDICAL JURISPRUDENCE). The given year of age of a child is gained at the first instant of the day preceding the birthday, and no account is taken of parts of a day, *e.g.* a child born at 11.59 on the night of the 2nd–3rd of May 1900, would be of age the first moment after midnight of the 1st–2nd of May 1921. In English law, by the Offences against the Person Act of 1861, it is a misdemeanour punishable by a maximum of two years’ imprisonment with hard labour, to endeavour to conceal the birth of a child by any secret disposition of its dead body, whether the child died before, or at or after its birth.

**Registration of Births.—**The registration of baptisms is said to have been first introduced by Thomas Cromwell when vicar-general in 1538, but it is only in comparatively modern times that registration has been fully carried out. The law relating to the registration of births was consolidated for England by the Births and Deaths Registration Act 1874, and for Ireland by the Births and Deaths Registration Act (Ireland) 1880. In Scotland it depends upon the Registration of Births, Deaths and Marriages (Scotland) Act 1854, as amended by later acts. Previously to the passing of the Births and Deaths Registration Act 1836, the records of the births were compiled from parish registers, which were formerly a part of the ecclesiastical organization, and continued to be attached, more or less, to the church till the passing of the act of 1836. That act provided a far more complete machinery than that before existing for the exact record of all births. The new system relieved the clergy from all functions previously thrown upon them, and finally, after improvement by subsequent acts, was made compulsory in 1874. The act of 1836 established a general register office in London, presided over by an officer called the registrar-general, with general superintendence over everything relating to registration. The registrar-general is appointed under the Great Seal. Every poor-law union or parish is divided into districts, each of which is called by a distinct name, and in charge of a registrar, who is a local officer appointed by the guardians of the union. Over each union is a superintendent registrar, who has supervision over the registrars within his district. The office of superintendent registrar is usually filled by the clerk to the guardians of the union. He receives quarterly from every registrar within his district certified copies of the births registered by him and having verified their correctness, transmits them to the registrar-general.

He takes charge of the register-books within the district, when filled. Every registrar is required to give information concerning any birth which willfully refuses to answer questions put to him by the registrar concerning the particulars required to be registered concerning the birth, and in the presence of the registrar to sign the register. Every person required to give information concerning any birth which willfully refuses to answer questions put to him by the registrar concerning the particulars required to be registered, or who refuses or fails without reasonable excuse to give information of any birth, becomes liable to a penalty of forty shillings. After three months a birth can only be registered in the presence of the superintendent registrar, and after the expiration of twelve months a birth can only be registered with the written authority of the registrar-general. In the case of an illegitimate child, no person as the father of such child is required to give information, nor is the name of any one entered in the register as the father of such a child, unless at the joint request of the mother and the person who acknowledges himself to be the father. An illegitimate duty is imposed upon the father by the *Notices of Births* Act 1877.

By that act it is the duty of the father of a child if he is actually residing in the house where the birth takes place at the time of its occurrence to give notice in writing of the birth to the medical officer of health of the district in which the child is born within thirty-six hours of the birth. The same duty is also imposed upon any person in attendance (i.e. medical practitioner or midwife) upon the mother at the time of or within six hours after the birth. The medical officer of health is then in a position to take such steps, by advice or otherwise, as may, in his opinion lead to the prevention of infant mortality. Notice under the act is given by posting a prepaid letter or postcard to the medical officer of health giving the necessary information. Failure to give notice entails on summary conviction a penalty not exceeding twenty shillings. The act is optional to local authorities, but may be enforced within any area by the Local Government Board. By the Births and Deaths Registration Act 1874 and the Merchant Shipping Act 1894, commanding officers of ships trading to or from British ports must, under a penalty, transmit returns of all births occurring on board their ships to the registrar-general of shipping, who furnishes certified copies of such returns to the registrars-general for England, Scotland and Ireland. These returns of births (and deaths) constitute the “Marine Register Book.”

Registration is very efficiently carried out in practically every European country, with the exceptions of Turkey and Russia. In the United States laws requiring registration vary in different states.
Tax on Birth—In 1694 an act was passed in England for "granting" to His Majesty certain rates and duties upon marriages, birth, and burials of barons, baronets, and widowers and widows for the term of five years, for carrying on the war against France with vigour." The taxes were graduated, rising from four shillings on the burial of the humblest person to £50 in the case of a duke or duchess. The duty on births varied according to the rank of the parents. A duke paid £50 on the birth of an eldest son, and £25 for every other child; a baronet or knight, £5 for an eldest son, and £1 each for other children. An archbishop or bishop, or a doctor of divinity, law or physic paid £1 for every child; a gentleman having a personal estate of £600 or a real estate worth £50 per annum, paid ten shillings on the birth of each child. Every other person not receiving alms paid a tax of two shillings on the birth of each child. This measure, however, was only temporary, and passed for revenue purposes solely.

BIRUNI [Abū-Raḥīm Muḥammad al-Bīrūnī] (973-1048), Arabian scholar, was born of Persian parentage in Khwazír (Khiva), and was a Shi’ite in religion. He devoted his youth to the study of history, chronology, mathematics, astronomy, philosophy and medicine. He corresponded with Ibn Sīna (see AVICENNA), and the answers of the latter are still preserved in the British Museum. For some years he lived in Jurján, and then went to India, where he remained some years teaching Greek philosophy and learning Indian. In 1017 he was taken by Māmūd of Ghazni to Afghanistan, where he remained until his death in 1048. His Ahkâr al-Biṣḥiya (Vestiges of the Past) was published by C. E. Sachau (Leipzig, 1878), and a translation into English under the title The Chronology of Ancient Nations (London, 1879). His History of India was published by C. E. Sachau (London, 1888), and an English translation (2 vols., London, 1888). Other works of his, chiefly on mathematics and astronomy, are still in manuscript only.

See C. Brockelmann, Geschichte der arabischen Litteratur (Weimar, 1898), vol. 1, pp. 475-476. (G. W. T.)

BISALTAE, a Thracian people on the lower Strymon (Struma; Karasu, "black water"), in the district between Amphipolis and Heraclea Sintica on the east and Crestonie on the west. They also made their way into the peninsulas of Acte and Pallene in the south, beyond the river Nestus in the east, and are even said to have raidied Cardia. Under a separate king at the time of the Persian wars, they were annexed by Alexander I. (495-434 B.C.) to the kingdom of Macedon. At the division of Macedonia in 181, King Aenetus of Rhodope and his brother of the Little of the Bisalatae were included in Macedonia Prima (Livy xiv. 29). Their country was rich in figs, vines and olive trees; the silver mines in the mountain range of Dreyson brought in a talent a day to their conqueror Alexander. The Bisalatae are referred to by Virgil (Georgics, iii. 461) in connexion with the treatment of the diseases of sheep. The fact that their eponymus is said to have been the son of Helios and Ge points to a very early settlement in the district.

See Smith’s Dict. of Greek and Roman Geography; M. Ihm in Pauly-Wissowa’s Realencyclopaedie der klassischen Altertumswissenschaft, i. 257; W. Tomasek, Die alten Thraeren (Vienna, 1893); and for the kings of the Bisalatae, B. V. Head, Historia Numorum, p. 178.

BISCAY (Vizcaya), a maritime province of northern Spain; bounded on the N. by the Bay of Biscay, E. by Guipúzcoa, S. by Álava and W. by Burgos and Santander. Pop. (1900) 311,391; area, 836 sq. m. A small strip of isolated territory within the borders of Biscay, on the west, is officially included in the province of Santander. Biscay is one of the Basque Provinces, and its name is occasionally employed as geographically equivalent to Basque, in that case including the three provinces of Biscay proper, Guipúzcoa and Álava. The coast-line, which extends from Ondarroa to a short distance east of Castro Urdiales, is bold and rugged, and in some places is deeply indented. The surface of the country is high, consisting for the most part very mountainous, being traversed towards the south by the great Cantabrian chain; but at the same time it is diversified with numerous narrow valleys and small plains. Some of the mountains are almost entirely composed of naked calcareous rock, but most of them were formerly covered to their summits with forests of oaks, chestnuts or pine trees, now destroyed to provide fuel. Horns and arbours are common, and furze and heath abound in the poorer parts.

The only river of any size is the Nervion, Ansia or Ibimabal, on which Bilbao is situated; the others, which are numerous, are merely large mountain streams. The climate is rather inclement and variable; but the thermometer seldom drops below freezing-point, nor does snow fall frequently in winter except on the highest summits. The rainfall is on an average greater than in any province except those of the extreme north-west. The soil, though not very fertile, except in some of the valleys and sheltered hill-sides, produces wheat, maize, barley, rye, flax, grapes, peaches, apples and other fruits. The mountainous slopes of Biscay are studded with the traditional Basque caserio, or farmhouse, in which the peasantry live on the montyaer system, dividing the profits of the soil with absentee landlords. The farms are generally small, and are for the most part tilled by manual labour. The fisheries are actively prosecuted along the coast by a hardy race of fishers, who were the first of their craft in Europe to pursue the whale, formerly abundant in the Bay of Biscay. Cod, bream, tunny and anchovy are the principal fish taken. The fishing fleet consists of several hundred boats, manned by nearly 5000 men and boys. Biscay is very rich in minerals. Iron of the finest quality is found in almost every part, and forms a main article of export. At the beginning of the 20th century an average of about 5,000,000 tons was produced every year, and many large foundries were at work. Lead and zinc are mined in much smaller quantities, alum and sulphur are also present, and marble, lime and sandstone are abundant. Another very important industry is the manufacture of dynamite and other explosives at Baracaldo, closely connected with the mining interests. There are also potteries, paper, soap and shoe factories, flour mills and breweries, and the many mineral springs and spas are frequented by people from all parts of Spain. The manufacturing and industrial interests of Biscay were very largely assisted by the quick and important development of means of communication of every kind. The provincial and parish roads, kept up by the local government, are excellent. No province in Spain had at the beginning of the 20th century such a complete network of railways, all built since 1870.

Bilbao (pop. 83,306), the capital and principal port, and Baracaldo (15,013), an important industrial town, are described in separate articles. Sestao (10,833) is the only other town of more than 10,000 inhabitants; the port of Bermeo (9061) is the chief fishing station; Durango (4319), on the river of the same name, was founded by the early kings of Navarre in the 10th century, obtained the rank of a county in 1153, and contains one of the oldest churches in the Basque Provinces, San Pedro de Tavira; Guernica (3250), a picturesque village on the river Mondaca, was until 1876 the meeting-place of the provincial councils. The depots assembled under an old oak-tree, celebrated by the Basque poet, José María Iparraquíre, in a song which is regarded by the Spanish Basques almost as a national anthem. For the history of the Basques, see BASQUE PROVINCES; for their origin, language and customs, see BASQUES. The inhabitants of Biscay are intelligent, enterprising and well-educated; and, owing to the uniformly high birth-rate, low death-rate, and very slight loss by emigration, their numbers increased rapidly during the latter part of the 19th century, until in 1900 the density of population (372-4 per sq. m.) was greater than in any other Spanish province.

BISCAY, BAY OF (Fr. Golfe de Gascogne; Sp. Golfo de Vizcaya), an inlet of the Atlantic Ocean; bounded on the E. and N.E. by France, as far as the island of Ushant, and on the S. by Spain as far as Cape Ortegal. The Bay of Biscay is the Sinus Aquitanicus, Sinus Cantabricus or Cantabri Oceanus of the Romans, hence it is often called the Cantabrian Sea. Its modern English name is a corrupt form of the Spanish Vizcaya. The bay forms a fairly regular curve, broken on the French seaboard only by the estuaries of the Loire, Garonne, Adour and other rivers. The rugged Spanish coast is indented by many
BISCEGLIE—BISECTRIX

fjord-like inlets, especially in the west, where navigation is sometimes difficult and dangerous; but its rivers are comparatively unimportant. The exposed position of the bay, and the diversity of its currents, have rendered it notorious for its storms.

BISCEGLIE (perhaps anc. Natium), a seaport and episcopal see of Apulia, Italy, on the E.S.E. coast, in the province of Bari, from which it is distant 213 m. by rail. Pop. (1901) 30,885. Two towers, one some 90 ft. high, of an once strong Norman castle still remain; the cathedral belongs to the same period. The church of S. Margherita, founded in 1197, has fine canopied Gothic tombs of the Falcone family.

BISCHOFFSWERDA, a town of Germany, in the kingdom of Saxony, on the Wenitz, and at the junction of the Dresden-Görlitz and Bischofswerda-Zittau railways in the governmental district of Bautzen. Pop. (1905) 7405. There are cloth, artificial flower, and cigar factories, glass-works, potteries, and in the neighbourhood large granite quarries. It is famous as the scene of a battle, on the 12th of May 1813, between the French and the Allies after Napoleon's retreat from Moscow. It was the residence of Benno, bishop of Meissen, in the 11th century, and the "Bishop's Road" still runs from here to Meissen.

BISCHWEILER, a town of Germany, in the imperial territory of Alsace-Lorraine, district of Lower Alsace, 23 m. by rail N. by E. from Strassburg. Pop. (1900) 7807. It has manufactures of jute and machinery, brewing and iron-founding.

BISCUIT (pronounced according to the old spelling "bisket," a Fr. form from Lat. bis, twice, and cooctum, cooked, in reference to the original method of preparation; cf. Ital. biscotto, Sp. bizcocho, &c.), a form of unasculated bread (q.v.), which is made in thin cakes of various shapes and baked in such a way as to be crisp and short. In the United States of America biscuits of this kind are usually called crackers, but the word biscuit is used there, as also in the north of England, for vesi-
culated bread baked in little flat loaves or cakes. Earthenware, porcelain, &c., which has undergone its first baking and is ready to be glazed is also known as biscuit or bisque.

The raw material chiefly used in biscuit manufacture is flour, but many other substances, such as butter, sugar, salt, various flavouring essences, &c., are also employed. The flour used by the biscuit-maker differs somewhat from that preferred by the bread-baker. In the main the bread-baker wants flour of some strength, that is to say, flour capable of absorbing a considerable proportion of water, and of making a loaf of more or less volume. For biscuits flour strength is not such a desideratum, and as a matter of fact such moisture as is used to make the dough is largely evaporated by the oven; but, except for the commoner kind of biscuits, colour is most essential, as well as sweetness of flavour. In a large biscuit factory several hundred different kinds of biscuits are made, ranging from plain water biscuits to the daintiest fancy biscuits glistening in sugar and piping. The storage required for such an establishment is extensive, but lifts serve to handle both raw material and finished products with a minimum of labour. The flour used by a firm which has a reputation to maintain is sifted as a precaution against the presence of bits of string or other foreign bodies which will make their way into flour sucked by the most careful of millers, and like the butter, sugar and other raw materials, is carefully inspected and tested before being accepted. After blending it is run through a shoot or sleeve to the mixers, which may be of any type used in bakehouses (see BREAD). From the mixers or kneaders the dough is delivered on a flat table, or it may go directly to a pair of rolls. These consist of iron rollers with a reversing motion, between which the dough is rolled backwards and forwards into sheets of uniform thickness. The next stage is the feeding of portions of this slab of dough to a cutting and panning machine. In details this apparatus differs as supplied by different makers, but the broad principle is the same in every case. The dough, after first passing through a pair of gauging rollers, which still further thin out the sheet and are capable of regulating its thickness with the utmost nicety, is received by an endless conveyor-band of webbing or similar material. By this band it is carried forward by intermittent motion to a set of punches or stamps which descend on it in quick succession, and serve to mould the surface and cut the edges to the required pattern. This operation completed, the moulded dough passes forward on the same endless band. The dough has now been cut into two distinct divisions, the moulded biscuits and the unworked portion which forms a continuous sheet of a sort of scrap. The latter is separated from the moulded dough, and is carried upwards by another band, which delivers it on a tray or box whence it is returned to the rollers to be reworked. The moulded dough intended for the oven is carried along by the first band and is gently deposited on trays of sheet iron or woven wire. These trays are taken from the machine by boys and placed on the travelling-chains at the oven, or the trays may be automatically moved forward by a travelling-band and placed on the oven. The oven used for biscuit-baking is quite unlike any bread oven. It is much longer and is provided with sets of endless chains moving in parallel lines, and travelling over sprocket-wheel terminals and intermediate supports. The chains have special attachments on which the trays of biscuits are rested, and thus pass them through the oven, and discharge them at the opposite end. Some ovens are provided with a sort of endless belt of iron plates on which the biscuits are placed. These travelling bands are used chiefly for ship and also for dog biscuits, but the most usual type is the oven in which trays are moved on the travelling chains already described. The exact rate of travel, or the time during which the biscuits are in the oven, can be easily adjusted by means of countershafts and leather belts running on cone pulleys fitted at the discharging end. The heat of the oven as well as the rate of travel is varied according to the kind of biscuit, some varieties requiring a gentle heat and a comparatively long sojourn in the oven, while others must be exposed to a fierce heat, but only for a few minutes. The ovens, fired by coke, may be 38 to 50 ft. in length. Their temperature is not generally raised above 300 degrees, but the speed of travel of the trays ranges between 32 and 25 minutes. The whole process of biscuit-making is thus rapid and continuous. The dough is kneaded in the mixers in a few minutes, and when discharged on the dough table is rapidly moulded into the required form by the cutter and panner. By means of endless bands the material is kept moving forwards, whether on the cutter or in the oven. For certain fancy biscuits special processes are used. Piping and sugar decoration is still necessarily done by hand, and the glaze on some fancy biscuits is imparted by spraying the moulded biscuit with very fine jets of fresh milk. Cracknels are made from a very stiff dough, and when cut out are thrown into copper of boiling water. They speedily float to the top, remaining apart and not forming into groups. From these coppers they are taken out in trays pierced as to drain off the water. Then they go into vats of cold water, from which they are again removed, and after being strained of their moisture are panned and baked in a fierce oven. (G. F. Z.)

BISECTRIX (fem. of Lat. bisector, from bi-, two, secare, to cut), in geometry, the same as bisector, i.e. a point which divides a line, or a line which divides an angle, into two equal parts; in crystallography it denotes the bisection of the angle between the optic axes.
